The goal of creating safe working conditions for sex workers is challenging. Due to local residents’ complaints and initiatives, the 2011 Viennese prostitution law significantly curbed street prostitution. The effect was a relocation to less visible, closed places, such as saunas or studios, as well as marginalized places at the outskirts of town, including motorway stops.

There is little information about the illegal market of prostitution. Escort services are popular, as is visiting brothels just over the border in neighboring countries. Such transnational movements are not easily regulated. It also complicates distinct treatment of prostitution and the trafficking in women and girls, as the task force on human trafficking alludes to in its two National Action Plans against Human Trafficking (2007–2008 and 2009).

Sexuality

Sexual identity, sexual orientation, contraception, and family planning remain topics of embarrassment, especially for adults and parents. Eighty percent of people over 14 are reported to have “good” or “very good” knowledge about contraception. Yet, the exact relationship of sexually

transmitted infections, undesired pregnancies, and condoms are not so clear to them (sexuality and gender study). As such, most parents hope or are happy that their children receive some kind of sexual education at school. However, a lack of precise knowledge about all aspects of sexuality is prevalent among young adults.

Seventy-seven percent of girls and 88 percent of boys have experiences with kissing before the age of 14. The numbers for first sexual intercourse are the highest for both young women and men after 18 (74% and 76%, respectively). Some argue that this means most young women and men have the space and ability to influence the setting of their sexual experiences. Both young men and women report being involved in some kind of relationship from a relatively young age: 42 percent of girls and 38 percent of boys by age 13 and 64 percent of girls and 52 percent of boys by age 14. More young women (62%) than men (40%) say that they would not sleep with someone without being in love.

Condoms are most commonly used for the first intercourse (although 12% used no or no safe means of contraception). Over time, a majority of women use the female contraceptive pill (38%).

Establishing a “healthy” individual identity and sexuality is not easy for young women. The Viennese Program for Women’s Health, for instance, states that young women in puberty are confronted with a constant sexualization of their transforming bodies while already struggling with a certain confusion and speechlessness regarding their own sexual desires and expressions. This is underlined by contradictory information and mixed messages about the technicalities of healthy sexuality.

Completed teenage pregnancies are low and decreasing. However, reported numbers for both girls under 15 and adolescent women (under 19) vary, and there are no official numbers of terminations in Austria in any age group.

Outlook

Formal achievements in women-specific, gender-sensitive social policy making remain accompanied by discontinuities and struggles to keep achievements in place. This nonlinear trajectory is most clear when looking at the challenge of ensuring permanent institutionalization. First institutionalized as the State Secretariat for Women’s Issues from 1979 to 1990, the office became an independent Ministry for Women in 1990–1991. It lost its institutional independence in 2000 when it was subsumed into the Ministry

of Social Affairs. From 2003 to 2007, a Ministry for Health and Women was created. Then the women’s portfolio was attached to the Federal Chancellery as “Secretariat to the Federal Chancellor’s Bureau.” The name *ministry* returned, but not as a de facto ministry and in combination with the purview of public service. However, since 2014, there is again a two-portfolio ministry: the Federal Ministry for Education and Women.

B

Belarus

Overview of Country

Belarus, a relatively small country of 80,200 square miles, is surrounded by numerous countries. Poland and Lithuania are to the west, Latvia is to the northwest, Russia is to the northeast and east, and Ukraine is to the south. The topography is that of rolling lowland hills and forests. Until the end of the 19th century, the Russian Empire ruled over Belarus. At this time, Belarus was referred to as either the Belarusian Soviet Socialist Republic or White Russia. Finally, as communism was ended, the country changed its name to the Republic of Belarus in 1991. Three years later, in 1994, Belarus adopted a new constitution that established a president and a parliament. Throughout its history, Belarus was and still is predominantly an industrialized agricultural country. The agricultural industry and the people of Belarus were negatively impacted by the Chernobyl Nuclear Power Plant accident. Today, the main industries still include agriculture, but they have expanded to include timber, metallurgy, electric power, peat, chemicals, and petrochemicals. More than half of the population (77.3%) lives in cities (Republic of Belarus 2015).

The population of Belarus as of January 2015 was approximately 9.5 million people, of which 83.7 percent were Belarusians, 8.3 percent Russians, 3.1 percent Polish,

1.7 percent Ukrainians, and 0.1 percent Jewish. Of the total population, females make up 53 percent, and males make up 47 percent (Republic of Belarus 2015). Life expectancy at birth is 62 years for men and 74 years for women (Lozny 2015).

Girls and Teens

Throughout its history, Belarus has been a predominantly patriarchal society, but in the 2010s, the country has been working to make gender equality a top priority. The idea of gender equality has been a major struggle and faces many obstacles because of cultural stereotypes that have permeated the society for such a long time. The lesbian, gay, bisexual, and transgender (LGBT) community has also wanted to be acknowledged and treated fairly, but they have encountered a lot of resistance so far. Today, women are attempting to gain more political power and to have more equal opportunities in the employment sector, but they are still confronted by numerous obstacles and barriers in their quest for equality. In 2014, the UN Development Programme ranked Belarus 53rd out of 187 countries based on the Gender Inequality Index (GII) (UNDP 2014).

Throughout the history of Belarus, many children lived in orphanages. Because many families were so poor, they did not think they could afford children and thought the

children would have a chance for a better life. Slowly, this has changed, and orphanages are not as filled as they once were. Despite the overbearing patriarchal beliefs and customs, there are numerous improvements for the equality of young girls.

In their family lives, Belarusian girls still help their mothers, and boys follow their fathers. Recently, though, men have taken on more of the responsibility of raising the children. Years ago, raising children was specifically a mother's job. For recreation, both males and females enjoy sports, after-school clubs, social activities, and spending time with friends and family. Music and television are popular ways to spend time with friends. For homes that have the Internet or use of Internet cafes, online activities are also quite popular. Outdoor activities abound, such as swimming, skiing, and cycling. Belarus has professional women teams in football (soccer), basketball, volleyball, handball, and goal ball. There are also recreational teams throughout the country.

Belarusian teens usually start dating at the age of 15. At first, dating involves teens socializing in large groups rather than two people spending time alone. Years ago, marriages were arranged by a teen's family, but this aspect of Belarusian society has ended. Parents may still try to influence their children, but they are free to marry whomever they want. Just as in other countries, online dating and matchmaking services are quite popular. Due to the increase in human trafficking, the Belarus government has placed some legal restrictions on Internet online agencies (World Trade Press 2010).

Health

The number one cause of death for both men and women in Belarus is coronary heart disease. In addition, the country is still seeing many incidents of cancer that can be traced back to the Chernobyl Nuclear Power Plant disaster in 1986. Most medical and dental procedures are free to citizens of Belarus.

In the 1990s, Belarus established perinatal and neonatal care units and helped to fund training for medical personnel. These units were sponsored by private industry and the Ministry of Health, who both helped to equip the centers with the proper medical equipment. The number of live births in 2013 was 103,000 (WHO 2015). In 2013, the National Statistical Committee of the Republic of Belarus reported that 83.9 percent of children were born to parents who were married (SIGI 2015).

Education

Primary Education

Education is a priority for the children of Belarus. The literacy rate is almost 100 percent. Children from grades 1 to 11 wear uniforms and attend school six days a week. Approximately 70 percent of children attend nursery school or kindergarten, even though preschool is not mandatory (Levesque 2000). Even in kindergarten and nursery schools, the children are influenced by some of the patriarchal stereotypes. For example, young girls are usually given dolls and stuffed animals to play with, and young boys are given cars, trucks, and play tools. If a teacher sees a child having interest in the opposite gender's toys, the teacher steps in and tries to persuade the child to play with the "appropriate" toys.

In 2011, Belarus passed a law guaranteeing equal access for education to all its citizens. Children are expected to start their formal education process at six years of age. Even though there is supposed to be no difference in the education of males and females, there is still an underlying bias that perpetuates the patriarchal stereotypes. For instance, most teachers are female, whereas most administrators are typically male. The gender role stereotypes can also be seen in the textbook materials. For example, in elementary schools, there are many texts illustrated with pictures of women cooking, cleaning, and other housework. The men are portrayed in pictures of sports; action activities, such as tree cutting; and working outside (Ananyeu et al. 2013).

Secondary Education

At the secondary level of education, there are still a few classes that segregate genders. These classes are physical education, industrial arts, and military training. For female students, the industrial arts class is called "service labor." The priority of the class is to train the girls to be good at housekeeping skills. Some of the specific skills they are taught are taking care of the house, home decorating, sewing, and furniture repair. The industrial arts class for boys stresses preparing them for future careers with a main emphasis on working in industry, information technology, and science.

The military and medical training classes are also split up based on gender. Male students are taught how to become a military hero. The textbook describes 161 heroic deeds performed by men but only mentions 5 heroic deeds by women (Shchurko 2014). The female students in this class are taught first aid, how to identify various injuries, and how to treat some medical conditions. The distinction

between the lessons girls are provided compared to those lessons provided to boys shows how women are still thought of as working in service roles.

In the physical education course, both males and females play sports, but the girls get more information about sex education—because girls are considered to have more responsibility in a sexual situation (Shchurko 2014). In primary and secondary education, almost all students are provided the same basic education curriculum, except for the three segregated classes. Students typically stay in school until the age of 15. Employment laws in Belarus ban the employment of children under the age of 14. With parental authority, children between the ages of 14 and 16 are allowed to hold jobs (SIGI 2015).

Higher Education

At the age of 15, most students will have completed their basic education and can register for college classes or classes at a professional technical institution. If they take college courses, the dual enrollment will count toward their high school completion and give them a start on college credits. If they pursue courses at a professional technical institute, they will earn a professional certificate and be able to enter the workforce or enroll in college. Completion of a high school or professional certificate allows students to apply to continue their education at the university level.

After high school, many students attend colleges or other professional technical institutions. In Belarus, the ratio of females to males in higher education is 54.6 percent females and 37.1 percent males (UNESCO 2015).

Belarus has one of the highest ratios of college students to population in Europe. Its higher education system is considered very prestigious because of its quality and affordability. Students have a choice of four different types of higher education, both private and public, to choose from: institute, classical university, higher college, or profile university or academy. Students have a wide selection of majors to choose from and can select day, evening, or online courses. Most of the majors take five years to complete if the student is going full-time. Colleges do offer grants and scholarships for students.

The Ministry of Education governs all higher education institutions. Many still believe that there are stereotypes in higher education, so in the late 1990s, the Envila Women's Institute of Belarus emerged. This was a college for women, and it specialized in empowering women and giving them more opportunities in specialized fields.

Literacy

Most young people have an almost 100 percent literacy rate, largely because Belarus has free education until the age of 18 and mandatory education until the age of 15.

Employment

Even though Belarus has come a long way with women's equality in the workplace, it still has areas that need further improvement. More females graduate from colleges and universities than males, but there are cultural stereotypes that still have an influence on females in the employment arena. Many females still hold to the tradition that a woman's main role is to be a mother and take care of children. The women in their early twenties spend more time trying to find a husband and start their family than on pursuing the career they were training for. Belarus tradition still places some pressure on women to be married in their twenties and have children before the age of 30. Therefore, many Belarus females measure their success in terms of whether or not they are married. Even though Belarus has added more laws to allow for more equality in the workplace, the underlying patriarchal customs are so deeply embedded in family tradition, it is difficult to achieve true equality.

Unemployment is a serious problem for females, especially for females who are divorced and have children. In 2008, 28,900 women were unemployed (65.6%), compared to 34.4 percent of men (UNFPA 2015).

Gender stereotypes still define the behaviors of both genders. Females are employed in the lower-paid and less-prestigious jobs, and jobs for most men are more prestigious and higher paying, even when the job does not require high-tech skills or a lot of education. Jobs for women are typically in trade and catering, cultural (artists, musicians, writers, actors, etc.), finance, credit and insurance, education, and health care institutions. The presence of women in these industries ranges from 73.9 percent to 85.7 percent (UNFPA 2015).

In 2014, the employment rate for women was 84.6 percent and higher than that of men (78.4%). According to data from the National Statistics Committee, women make only 74.5 percent of what men earn (Piatrukovich 2014). Some of this is still because of the patriarchal customs and stereotypes that influence women's choice of jobs. An example of this is the education system. Most teachers are female, and the teaching profession overall is a low-paying career field. The educational system still reflects the stereotype that women are the caretakers of children.

Labor Regulations

Belarus recognizes that women should have equality in the workplace, but they still have regulations on certain jobs that women are not allowed to hold. The chief technical inspector for the Belarus Federation of Trade Unions, Aleksander Zaitsev, explained, “There are certain jobs that a woman just shouldn’t do, because she has her children and family to worry about. There are plenty of less demanding occupations out there for women. They should, of course, be properly paid” (Piatrukovich 2014).

In 1932, Belarus passed a law that listed specific jobs that women were not allowed to have. The government tried to justify this law by explaining that it was passed to protect women’s health. In 2000, the list was revised and downsized to 252 occupations that women could not hold. Some jobs on the list included firefighters, train drivers, and truck drivers. The most recent revision of the list was amended by the Belarusian Ministry of Labour and Social Welfare in June 2014. The number of jobs women cannot legally hold decreased from 252 jobs to 181 (Piatrukovich 2014).

Maternity Leave

According to the Labor Code 184, Women may have maternity leave for 70 days for prenatal leave and 56 days for postnatal leave. If a woman lives or works in an area where there is a high level of radioactive contamination, she may take 90 days prenatal leave and 70 days postnatal leave. Code 185 states that a woman may request part-time work until her child is three years old. Code 263 prohibits women who are on postnatal leave and women with children under the age of three from working night hours and overtime (ILO 2011). Although unspoken, there is much discrimination against women in the employment sector. Businesses view women as employees who will be taking a maternity leave or asking to take time off to take care of sick children; therefore, many businesses will not hire them or will offer them less money.

Family Life

In the past, many Belarusians lived an agricultural life, but today more than half the population lives in urban areas. Family households consist of parents, children, and possibly grandparents. The family structure is still considered between a man and a woman. The LGBT community is present, but it is not acknowledged in society, even with continued efforts toward equality.

Marriage and Divorce

Despite some improvements in gender equality, many individual families still hold the traditional stereotypes of men being the powerful ones and the money makers and women being responsible for home duties and child-rearing. There are some changes slowly happening where men are starting to play a more active role with children. Early in the history of Belarus, marriages were arranged by the families. Some of the qualities that were considered optimal for a woman were that she needed to be a good field worker and housekeeper. Beauty and money were not considered the most important qualities. Females were expected to get married according to their rank in the family structure. Then once Belarus was no longer influenced by communism, young people could choose their partners, but they had to request permission from the families involved.

Today, young people are free to choose their partners without the families getting involved. Divorce is also by mutual consent. Belarus has the fourth-highest divorce rate in the world (Preiherman 2012). The distribution of marital property must be agreed by both people. Sometimes this can cause problems, because if the husband refuses to leave or refuses to sell the house and divide it equally, the woman may be financially forced to stay or to leave and live in poverty.

Reproduction and Contraception

Women in Belarus are able to get abortions at state-owned hospitals free of charge for up to 12 weeks of pregnancy. In certain situations, they may also get an abortion after 12 weeks. From weeks 13–26, women may still get an abortion, but it has to meet certain criteria: if there is a serious threat to the mother, the baby has congenital defects, the mother is a juvenile or divorced, or if the husband is imprisoned during the pregnancy. Women under the age of 18 may also get an abortion, but they must have written consent from one of their parents.

“According to the 2013 Statistical Book of the National Statistical Committee of the Republic of Belarus, in 2012 there were 1,781 abortions . . . compared to 2,227 in 2011, among women aged 15–49 years old” (SIGI 2015). Emergency contraception is available to women without a prescription. The country has a declining population, so the government would like to see more women having children; but it is understood that many single women may feel as though they cannot afford a child and will have an abortion.

Most children learn about sexual reproduction from their friends, and their first experience is usually without a form of contraception. Sex education is typically not covered in the school, except for a brief mention to girls about their responsibility for sexual relations. All forms of contraception can be obtained through drugstores; no prescriptions are necessary.

Household Roles and Responsibilities

In Belarus households, there are still some remnants of the stereotyped customs. For example, it is still considered a woman's job to set the table; for some, it would be considered degrading to a man to do this. In 2010, President Lukashenka described the role of women in the family by stating, "God has bestowed upon women the gift of motherhood. Career or no career, women must be in charge of raising their children. I want our women to have no less than 3 children each" (Piatrukovich 2014). Gender roles are still relatively traditional: men are considered the more dominant and powerful members of the family, while women are still weaker and responsible for caring for the children, household, and husband.

Birth Rates

The birth rate for Belarus is declining. Many families are having only one child instead of the three that the president suggested. The families are concerned for their children's future, the ability to financially take care of a large family, and an increase in housing problems.

Inheritance

With inheritance, there seems to be more equality for men and women. Whatever each individual brought into the marriage remained theirs, even if divorced. Only marital investments were considered "marriage property." When a spouse died, the property that was theirs went to their heirs or was returned to their family. For example, any money that a woman made from sewing or selling produce from her garden was strictly hers. A wife was not responsible for any of her husband's debts. On the other hand, the husband was responsible for the debts of his wife. Years ago, the sons inherited the property of the parents and were responsible for helping the daughters to marry. If there were only daughters to inherit the property, the eldest daughter's husband took over and was obligated to take care of the younger sisters until they married.

Politics

Participation and Roles in Government

The UN Committee on Elimination of Gender Discrimination against Women (CEDAW) suggested that women are poorly represented in leadership positions in the Belarus government, judiciary positions, and diplomatic service positions. There is only 1 woman minister in Belarus. There are no chairpersons of regional executive committees (7 are men). There are 42 male deputies and 1 female deputy. At the district and city levels, there are only 2 women and 130 men holding chairperson status on executive committees. There is improvement in Parliament, where women now make up 45 percent of the seats, but this number is a little misleading because the Parliament cannot make decisions without the permission of the president's administration, which is composed of all males. Among the 15 political parties that are registered, only 1 is headed by a woman (Ananyeu et al. 2013).

Feminist Movements

It is very difficult to get many movements or organizations started because of the government control over them. For example, one organization was the Hope Party which was established in 1994 to increase the influence of women in politics. It was disbanded by the government in 2003. Some researchers believe that both males and females do not want to have a feminist movement in Belarus. Many believe that this is because feminism has been misrepresented in the country and misunderstood. Even though it is a struggle to get movements started, several organizations have sustained themselves throughout the years. Some of the organizations are the Belarusian Union of Women, which provides aid for poor families; Nadzeya, founded in 1994, which attempts to get more women into the political sphere; the Belarusian Organization of Working Women, which works with women in industrial enterprises who live in the countryside and are poorly educated; Ragneda, founded in 1996, which tries to defend the rights of working women; the Belarusian Association of Young Christian Women, which maintains its goal of working on the principles of Christian morality and mutual aid; and the Women's Discussion Club and Lady Leader Club, which both try to raise awareness of women's leadership potential (UN Publications 2004).

LGBT Rights

When people in Belarus think of gender equality, they think of men and women; they do not consider any other

Women's Voices

Natallia Mankouskaya

Natallia Mankouskaya, a past competitor in the Belarusian Dance Sport Federation, is the deputy chair of the LGBT Rights project GayBelarus. As a vocal and visible advocate for gay rights in Belarus, she has organized pride marches and protests and has written disputes against inhumane treatment of LGBT community members. The Belarusian government has repeatedly targeted Mankouskaya, detaining her for hours of interrogation and banning her access to public forums and free speech. In September 2013, she was removed without cause from a train as she crossed the border from Ukraine to Belarus, and she was subjected to three hours of interrogation and a body search (Civil Rights Defenders 2013). In response to the death of a man who was beaten and killed for being gay, Mankouskaya said, "Police often ignore crimes against the LGBT community. Attackers receive impunity, and our government does nothing, [sometimes] blam[ing] the victims for 'demonstrating their orientation.' It is unacceptable that the state is not fulfilling its obligation to protect all people from violence, regardless of their sexual orientation and gender identity" (Plummer 2015).

forms of gender identification. For instance, transgender individuals are rarely considered when discussing gender equality. When groups try to propose broadening the definition, they are usually met with hostility. Even though at the end of the Soviet Union, in 1991, Belarus formally decriminalized homosexuality, anti-gay sentiments are still felt throughout the country. The president of Belarus, Alexander Lukashenko, once said, "It's better to be a dictator than a gay" (Karmanau 2013). With comments like that, it is difficult for the LGBTQ community to feel safe.

There are instances of violence against the community. The leader of a gay rights organization, GayBelarus, was denied the right to leave Belarus and visit the United States. His passport was taken from him for no apparent reason. The organization tried to legally register the group in January 2013. More than 70 GayBelarus members signed the documents that were necessary to help formally acknowledge the organization. They submitted the documents to the Justice Ministry, but three days later, one of their meeting clubs was threatened by police. The members were treated as criminals and asked numerous personal questions without valid reasoning for the questioning. Members had to hold underground educational

seminars and meetings in small towns out of fear of retaliation (Karmanau 2013). Occasionally, the group tries to organize a gay rights demonstration, but it is usually broken up by the police.

Armed Forces

Men are required to take part in the military, but women may volunteer to join if they wish. There are fewer women in the armed forces than men, but when enlisted, they face the same physical and other testing as their male counterparts. In the mid-1990s, there were approximately 3,000 servicewomen, many of whom worked at headquarters as secretaries (Samojeden 1996).

Religion and Cultural Roles

The principal religion of Belarus is Orthodox (more than 1,000 churches), but there are numerous other religious groups represented in the country, such as Roman Catholics (400 churches), Protestants (500 churches), Jews (40 temples), and Muslims (27 mosques) (Republic of Belarus 2015).

Media still perpetuates the cultural stereotypes of women. Most women in the media are depicted as mothers, wives, and housewives. In addition to the stereotypes, the media also presents women as sexual objects for men's pleasure. Many of the advertisements in both print and online magazines contain photographs of women either nude or seminude trying to sell men's products. In many of the advertisements for women's products, there is a subtle suggestion that women are to please a man first.

Issues

Domestic Violence

Domestic violence is quite prevalent in Belarus, even though many instances go unreported. It is a crime that many women are ashamed of, or they try to fix the situation, maybe eventually divorcing their husbands. The Centre for Social and Political Studies of the Belarusian State University reported that 80 percent of the Belarusian women aged 18–60 who were surveyed were exposed to psychological abuse, and 25 percent were exposed to physical abuse in their families (SIGI 2015). The laws on domestic violence have recently been changed. Under Belarus's Criminal Code, domestic violence was not considered a crime, but in April 2014, a new law was ratified that now defines domestic violence and has put in place restraining orders for the victims' protection. It also suggests establishing more programs on identifying and preventing domestic violence, but until these go into effect and money is found to fund these programs, women will still be suffering.

Currently, there are several helplines established for women to call in and learn more about their options and the programs that are available. The General Directorate of Law Enforcement and Prevention in Belarus reported that approximately 2,000 crimes are committed within the home every year. The committee also reported that one in four women will experience physical violence, and four out of five women will experience some form of psychological violence (SIGI 2015). In June 2014, 106 women and 104 children were helped by the shelters (WAVE 2015).

Trafficking

Belarus is known to be a source, destination, and transit country for human trafficking, especially prostitution and forced labor. Most of the victims are women who are forced into prostitution in other countries. According to the Ministry of Interior, most victims are single, unemployed

females below the age of 30. Human traffickers typically use informal social networks to approach potential victims. Belarus has enacted laws (Article 181) banning trafficking. Punishments range from 2 to 15 years. The government reported 219 human trafficking investigations in 2009, including at least 10 labor trafficking investigations (U.S. Department of State 2010).

Sexual Assault and Rape

In Belarus, rape is considered a criminal offense under the country's Criminal Code, but most people do not classify spousal rape under this category. For those convicted of rape, the sentence is usually imprisonment for 3–15 years, depending on the age of the victim. Just as with domestic violence, it is believed that many rape victims do not report the crime because they are ashamed and believe they will be treated as though they were responsible. The Ministry of Internal Affairs reported 68 cases of rape between January and September of 2012 (U.S. Department of State 2010).

Sexual Harassment

In Belarus, there are no specific laws regarding sexual harassment in the workplace. One of the laws in the criminal code, Article 170, does cover coercion to perform a sexual act through threat, blackmail, or exploitation of economic dependency. The penalty for this crime is up to three years' imprisonment (SIGI 2015). Few people are charged with this offense because the burden of proof falls on the victim.

Belgium

Overview of Country

Belgium is located on the western end of the North European Plain and borders France, Luxembourg, Germany, and the Netherlands. The country is roughly 11,780 square miles (30,510 sq. km), with a hilly topography that gradually rises toward the nation's southern regions. As of January 1, 2010, the population of Belgium was 10.8 million (UNICEF 2010).

The nation-state of Belgium was formed at the Conference of Vienna in 1815, when the regions formerly known as the Southern Netherlands and the Northern Netherlands were combined into a single state. King William I initially ruled this new territory. The new region's large Catholic population, however, objected to this unification because their new king was a devout Protestant with an active interest in advancing his own religion by involving himself in clerical affairs (Essen 1920, 15). In response, Catholics revolted in Brussels, the capital of Belgium, and in 1830, their revolutionary actions led to political independence from the Northern Netherlands. Following this revolution, European powers agreed to recognize the new Belgian state along with its newly anointed king, Leopold I of Saxe-Coburg (1865–1909).

It was during Leopold's reign that Belgium slowly emerged as a world leader in industrial production and began to expand its empire through colonial expeditions to Africa. By 1908, the African nation of Congo was formally under the control of the Belgian king, Leopold II (Vanthemsche 2012, 56).

Belgium was occupied by Germany during World War I and World War II, but since the mid-20th century, the nation has experienced a noticeable economic boom that has transformed it into one of the most developed, urbanized, and densely populated countries in the world. Indeed, today, roughly 97 percent of its 10 million residents live in or near cities. Brussels counts 1 million residents, and Antwerp, another major city, lists half a million residents.

Much of the rest of the population lives in or near other cities, such as Flanders (55%) and Wallonia (35%).

Belgium's population is now extremely diverse and includes sizable numbers of Jews (in areas like Antwerp), Poles, Italians, North Africans, and Turks. This ethnic diversity is largely the result of immigration waves that occurred between the 1930s and 1960s and after the fall of communism (Stanard 2012). In fact, roughly 15 percent of the nation's population is noncitizens, and 28 percent of these expatriates live in Brussels. Belgium is, in other words, at the heart of Europe. The diverse composition of the country makes it an appropriate choice to house branches of NATO and European Union (EU) institutions.

Belgium's three official languages are Dutch, French, and German. However, Dutch and French are the languages most often used in the national administration. French was adopted as an official language in 1830, and it currently remains the most common language used in Wallonia and Brussels. In contrast, Dutch (which is more commonly referred to as Flemish) remains the popular language spoken in Flanders. The modern coexistence of these three languages is representative of the nation's generally harmonious blending of multiple cultures. In fact, despite having officially designated languages, the Belgian Constitution contains provisions that provide for "freedom of language" (Sarolea 1915).

Belgium's modern federal state consists of these three different language communities that maintain individual control of their culture, education, economic development, and infrastructure. This complex structure has resulted in six governments and six parliaments and serves to emphasize the nation's interest in promoting the cultural autonomy of each language community while also giving each power over its own economic development. The entire legislative system is built upon the ideal of discussion and compromise between these different interest groups. The term "Belgian compromise"—a phrase often used by politicians from neighboring countries—has become synonymous with resolving complex issues through discussion and concession (Brans 2006).

It follows that such a diverse sociopolitical environment tends to avoid nationalistic imagery and symbols that fail to account for the complex origins of the country. For instance, the Belgian national anthem, the "Brabanconne" (1830), is rarely taught in schools and is not widely known by contemporary citizens. Observers claim this is largely due to the song's perceived critique of the Dutch monarchy (Herman, Vos, and Wilson 1992).

Since 1960, Belgium's economy has heavily relied on foreign trade and commercial activities with its European neighbors. Close to 76 percent of the nation's exports and more than 71 percent of its imports occur with EU partners (Deschouwer 2012). Belgium is widely regarded as the world's "diamond capital." Since 1996, the turnover from the diamond industry was around \$23 billion, which contributed roughly \$3 billion to \$4 billion to the Belgian economy (World Bank 2014). The nation also generates revenue through industries devoted to processing such raw minerals as limestone and dolomite. Belgium is also high among the world producers of iron, steel, and crude copper.

Today, Belgium is one of the wealthiest nations in the world. Statistics from the World Bank show that Belgium has grown faster than virtually every other "rich country," with the notable exception of those found in East Asia. This is, no doubt, due to the country's productivity, which ranks among the highest in the world. Despite its small size, Belgium produces nearly 20 percent more products (goods per worker) than Japan, the United States, and Germany (UNICEF 2010).

Perhaps due to the nation's contact with so many diverse states and peoples, Belgium also enjoys a global reputation as a tolerant state. For instance, Belgium legalized euthanasia—the right to end one's life through medical assistance—in 2002 and was one of the earliest nations to legalize gay marriage in 2003. Belgium's interest in neutrality and peace led the nation to become the first to formally ban the use of cluster bombs, and, in 2006, the state also outlawed the practice of forced marriage.

Overview of Women's Lives

Belgium is an ethnically and culturally diverse, progressive nation with a generally high standard of living. However, in the area of women's rights, Belgium still lags behind other Western countries in a few key areas. On one hand, the *Global Gender Gap Report 2012*, which was compiled by the World Economic Forum (WEF), praises the high literacy rates and low unemployment of Belgian women and points out that the "glass ceiling," or gender-related factors that might prevent women from advancing in careers, seems to be less prevalent in Belgium than in other European nations. Some contemporary pundits have even argued that Belgian feminist activism dates back to the 19th-century formation of the nation and cite it as one of the enduring legacies of Belgium's strong democratic and egalitarian culture (Woodward 2008).

Nevertheless, women are still underrepresented in the Belgian government and in senior management business positions. Belgium also continues to rank very high in studies that track the rate of sexual violence toward women and in those that examine the prevalence of human trafficking (Hilden 1993). These are the principal areas that Belgian lawmakers are currently working to rectify through the passage of new laws that will weaken the barriers to gender equality and sensitize citizens to sexual violence toward women.

Girls and Teens

Belgium is one of the few European nations with compulsory education up to 18 years old, and women have long been a welcomed part of Belgium's institutions of higher education. The first women's college was created in 1864, almost exactly 33 years after the nation's founding; Brussels University, the largest university in Belgium, began admitting female students in 1880. By 1884, medical schools and law schools were open to female applicants. Such statistics underline the surprisingly progressive nature of Belgium culture, even during this very early period.

Since 1956, the state government, which makes the cost of education virtually free, has financially supported all public and private schools. This commitment has produced startling results. A 2003 study found that roughly 99 percent of Belgian women are capable of reading and writing (OECD 2012).

Belgian women tend to be even better educated than their male counterparts of the same age. In 2009, 49 percent of women aged 25–34 had obtained a university-level degree compared to 36 percent of men. These figures represent a dramatic cultural shift from older Belgian generations. For instance, only 21 percent of women between the ages of 55 and 64 have completed a university education (OECD 2012).

There is, however, a large gender difference in mathematics and science performance between men and women. This same study explained the lack of a strong visible presence of women in fields such as computer science at the university level. Women account for only 7 percent of the degrees awarded in computer science, which is the lowest among all EU countries (OECD 2012).

Health

Public attitudes toward sex and sexual expression have become more liberal in Belgium since 2000. At the end

of 1999, reproductive health became one of the five focal areas of the Belgian Development Cooperation (Parker et al. 2009, 230–234). Initially, the goal of this program was to educate children about issues related to reproductive health, to provide for the establishment of new maternity-focused hospitals, and to contribute to the worldwide fight against HIV/AIDS. In 2000, the budget for this program was \$17.5 million a year. By 2005, this funding had risen to \$60 million (232).

Belgium subcontracts youth sexual education to local civil society organizations. In French-language regions, the curriculum for sexuality education is governed by family planning centers administered by the Francophone IPPF Member Association (FLCPF). The complex organizational structure that governs and administers sex education means that the quality of providers and curricula varies from region to region (235).

Teen Pregnancy and Abortion

The legal age of consent for sexual activity is 16 for both heterosexual and homosexual relationships. Underage sex, however, is generally only prosecuted in instances in which one of the parties is under 14 years old.

Belgium has a low rate of teenage pregnancy. Recent studies show that only 14.1 out of every 1,000 births are the result of teenage pregnancies (Kremer 2006).

The low rate of teenage pregnancy is likely related to the readily available contraceptive options for women of reproductive age. The government often subsidizes the cost of condoms and has worked to significantly lower the cost of contraceptive pills. Some forms of emergency birth control, such as the morning-after pill, are offered free and without a prescription. Teenagers, as part of their sex education, are made aware of the numerous contraceptive services available to them locally.

Employment

Between 1990 and 2010, the female labor force increased dramatically, from 46 percent to 62 percent (U.S. Department of State 2011). Despite this increase, the average number of Belgian women in the workplace is still less than other European nations (which have around 65% female participation) and significantly less than male participation in Belgium, which consistently remains at around 73 percent (Meulders et al. 2011). The rising number of women in the workplace can be credited to stronger

governmental efforts to craft policies that promote gender equality between men and women in hiring practices and wages.

In 2002, the National Plan for Employment identified women as one of three disadvantaged groups that should be the focus of new employment laws and programs (the others were seniors and unskilled workers). This plan proposed new programs designed to promote and train women in underrepresented fields, such as information and communication technologies. The report also noted that it was important “to make what had been perceived as male spheres of employment open to women” (Hecq and Meulders 1993).

Belgian legislative efforts have dramatically reduced the gender wage gap that exists more prominently in other European cultures. Since 2010, the gender wage gap has remained around 8.9 percent, which is significantly lower than the 15.8 percent average of other EU nations (Hecq and Meulders 1993).

Despite positive changes in wage equality, Belgian women remain underrepresented in labor unions and other labor-related decision-making bodies. While 62 percent of women participate in the national workforce, less than 27 percent of these women participate in work councils or labor unions (Meier 2008). Even in the largest labor unions, such as the Confederation of Christian Trade Unions, women are much less involved than men. Some unions have also attempted to segregate women from their male counterparts through the creation of women’s sections, which threaten to make women’s issues separate from the general concerns of the larger union (Meier 2008).

Women in Belgium remain significantly underrepresented in senior management positions. Less than 10 percent of the boards of listed companies are women, and only 34 percent of senior managers are women. In addition, a majority of women’s employment opportunities are part-time service jobs. These service-industry jobs account for 30 percent of women’s employment, while less than 3 percent of men hold part-time positions (Meulders et al. 2011).

Family Life

Unlike in other Western nations, Belgian women are not expected to change their last names when they get married (Hazelle 2002). The male is still generally viewed as the provider, but the significant presence of women in the workplace points to a culture that increasingly encourages greater degrees of female autonomy.

Marriage

Belgian laws set 18 years as the minimum age to enter into marriage. Those under 18 who wish to marry would need the approval of a youth court, which is hard to attain except in extreme situations, such as teen pregnancy. As of 2010, 4.5 million of Belgium’s inhabitants were married, 710,927 listed their status as widowed, and 899,425 people were divorced (UNICEF 2014). Others—close to 180,000—lived together under some form of legal agreement. This group also includes siblings who entered into an agreement. Between 2003 and 2010, 17,000 of Belgium’s married couples were in same-sex marriages (Macedo 2014, 232). In 2010, the average age of a woman getting married for the first time was 29 years old (compared with an average age of 31 for men), which continued a consistent rise in age that first began in 1989 (when the median age was 24).

Reproduction

The birth rate in Belgium is roughly 118,000 children each year. Since 2008, Belgian women have given birth to 1.85 children on average. These figures are generally consistent with those of neighboring Western European countries, but they are also significantly lower than past Belgian generations. As contemporary Belgian women achieve higher levels of education (and develop more earning potential), they are also deciding to postpone marriage until later in life (until well into their thirties) or to remain single. Some commentators wonder about the long-term impact of Belgium’s lower fertility rates—that is, deciding to have children later in life and opting to have fewer children—on the country’s population. They claim that if current patterns continue, the Belgian population will be reduced by half in the next 18 to 20 years (Yew 2012).

Abortion

Strictly observed abortion laws and guidelines exist for women wishing to terminate their pregnancies. Since 1990, Belgium’s abortion laws have only allowed for abortions in the first 12 weeks of pregnancy (Parker et al. 2009, 232). Abortions sought after 12 weeks are only allowed to proceed if two doctors agree that there is a health risk to the mother or child. Only 1 percent of abortions performed were for women under 18 years old (233). Since December 2001, the cost of abortions has been reimbursed if performed in an abortion clinic that has signed an agreement with the National Institute for Social Security (233).

Support for Mothers and Caretakers

All Belgian women are entitled to some form of earnings-related maternity leave. Belgian women with jobs in the public sector are provided with 15 weeks of maternity leave. A woman can begin taking her leave up to 6 weeks before her projected due date. Self-employed women are provided with 8 weeks of subsidized maternity leave by the state. In addition, up to two weeks of paid postnatal leave can be taken as “free days,” which has the effect of extending the allotted 15 weeks even longer. In the case of multiple births, the length of the leave is extended by 4 weeks. Maternity leave is also extended if the birth results in health complications for the mother or baby. In the case of the former, the baby’s father is allowed 60 percent of his earnings in addition to the extended maternity leave payments to the mother (Kremer 2006).

Belgium has one of the best and most comprehensive systems of care for children younger than six years of age. Beginning in the 1980s, the Belgian government federalized subsidies for child care through two principal offices: the Bureau of Birth and Childhood (for French-speaking communities) and Child and Family for Flemish-speaking communities (267). In addition to formal governmentally subsidized child care facilities and services, the Belgian government also provides considerable tax deductions for families who opt out of these programs. In December 1988, for instance, the government allowed families to deduct 80 percent of their care expenses from their taxable incomes (267).

Inheritance and Property Rights

Belgian women are afforded full property rights and legal protections. In the absence of a will, for instance, a married woman inherits her husband’s entire state. If both parents are deceased, the couple’s surviving children inherit equally (regardless of gender) from their parents.

LGBT Rights

Belgium is widely known as an LGBT-friendly nation that is at the forefront of European efforts to extend rights and government protections to gays and lesbians. As early as 1998, Belgium implemented laws that recognized same-sex unions and partnerships, and by January 2003, these rights were extended to include recognized state-sanctioned same-sex marriages. Belgium is 1 of 16 countries that now extend the freedom to marry to same-sex couples. In 2006,

Human Rights and Gender Identity in Belgium

In 2008–2009, the Institute for the Equality of Women and Men (IEWM) commissioned a study on discrimination against transvestite, transgender, and transsexual people in Belgium. The study concluded that further steps must be taken to protect transgender people from discrimination, including strengthening laws involving privacy issues, birth certificate and identity records, and protecting their rights in systems of education, labor, health, and adoption and parenting. It also noted that these rights should be extended to all gender-variant individuals, including those who have not yet undergone reassignment or affirmation surgery and those who do not plan to do so. A report titled “Being Transgender in Belgium: Mapping the Social and Legal Situation of Transgender People” (2010) outlines the institute’s recommendations for developing government policy to support transgender people.

Belgium went even further and recognized the right of married same-sex couples to adopt children.

Politics

Belgium has a system of proportional representation that contains multimember constituencies that vary in size depending on the level at which elections take place. For the federal Upper House and the European Parliament, the country is divided into two constituencies comprising each of the major linguistic communities. For all other elections, the constituencies are more numerous and based on geographical entities. Belgium has a multiparty system, and the major parties include Liberals, Greens, Socialists, and Christian-Democrats. There are also smaller regional parties, such as Volksunie and Vlaams Blok, in cities, such as Flanders. The political process is an active part of Belgian life—so much so that voting is a legal requirement of all citizens.

Women did not comprise a large and active presence in Belgium’s politics until the late 20th century. Prior to the 1986 establishment of the Ministry of Employment and Equal Opportunity there were not a significant number of women in important positions within Belgium’s

government (Tremblay 2008). Women's suffrage, especially between the years 1830 and 1948, was largely viewed as an issue of secondary importance by the political establishment (Hilden 1993).

Despite legal restrictions that limited women's participation in government, there were a few women, such as Marie-Anne Spaak-Janson (1873–1960) and Marguerite De Riemaeker-Legot (1913–1977), who managed to rise to political office. Spaak-Janson was the first woman to serve in Parliament in 1921, and De Riemaeker-Legot was the first woman to hold a major government office, as head of the Ministry of Family and Housing from 1965 to 1969.

In 1989, Belgium amended its constitution to limit the obstacles that might prevent women from fully participating in national political life (Tremblay 2008). Other laws soon followed, and the Smet-Tobback law, which was passed on May 24, 1994, went so far as to stipulate that no more than two-thirds of the candidates on a political ballot could be members of the same sex. The law stipulated that if one-third of the candidates on a ballot were not from an underrepresented sex, then those places on the ballot were to be left open. The Smet-Tobback law first applied to European federal and regional elections during the summer of 1999.

The idea that legislation is an effective way to address the small number of women legislators has attracted debate and controversy since first proposed (Praud 2012). Some supporters of the law criticize it for not going far enough and instead propose that the quota should be raised. Detractors, on the other hand, point to what they perceive as the law's ineffectiveness: they argue that despite existing laws (and what they argue is "preferential treatment") women still fail to be elected to government positions in significant numbers.

Today, women occupy only 17 percent of the positions in the Belgian government (Praud 2012). Their numbers are slightly higher in Parliament. Women occupy almost 29 percent of the upper house and fill 24 percent of the lower house seats.

Religious and Cultural Roles

Catholicism is the dominant religion practiced in Belgium, though there are also communities of Protestants, Jews, and Muslims. Catholics account for roughly 75 percent of the population. Protestants and Jews collectively account for less than 1 percent, and around 3.5 percent of the population identifies as Muslim. These figures underline the

fact that more than 20 percent of the nation's population does not strongly identify with an organized religious group. Despite the large number of nonreligious citizens, the Belgian government has made it a practice to protect religious freedom and to financially support ministers in all recognized faiths by paying their salaries and pensions. Recognized religious groups received 100 million euros (around USD\$109 million) from the government in 2009. According to Belgium's Ministry of Justice, the government paid the salaries of 2,750 priests, 333 lay consultants, 122

Women in Belgian Cinema

The fractured nature of Belgium's linguistic communities makes the establishment of a coherent national, unified Belgian cinema difficult to define. Nevertheless, it is within this environment that several prominent women film directors have emerged. Agnes Varda (1928–), who is credited as one of the few female members of the 1960s male-dominated French New Wave avant-garde movement, was born in Brussels, Belgium, and still remains a national citizen. Her film *Cleo from 5 to 7* (1962) examines the way consumerism and the need for approval disproportionately informed the mid-20th-century female sense of self.

The film's story follows a female pop singer over the course of two hours while she awaits the results of what is described as an important medical test. With two hours to spare, Cleo, the film's central character, meanders through city streets, dancehalls, and department stores. The film's powerful feminist message removes the central character from the confines of societal expectations and ideals of beauty and focuses on her growing awareness of the way she is visually objectified and consumed by others to show her inner evolution toward achieving real human intimacy and contact for the first time. The result is touching and compelling cinema.

Other Belgian films by women directors include *Femmes-Machines* (1995), by Marie-Anne Thunissen; *Greek Tragedy* (1985), by Nicole Van Goethem; *Nuit et Jour* (1991), by Chantal Akerman; *Pauline and Paulette* (2001), by Lieven de Brauwier; *The Quarry* (1998), by Marion Hansel; and *Antonia's Line* (1995), by Marleen Gorris.

Protestant pastors, 15 Anglican ministers, 49 Orthodox priests, 34 Jewish rabbis, and 39 Muslim imams (2014).

The Belgian government's public image of historical tolerance for religious diversity was challenged in 2011 when the legislature passed new laws that outlawed garments that hide one's identity. These laws were widely viewed as targeting the nation's Muslim women, many of whom, as part of their religious practice, wear full veils that shroud their faces. The law was challenged in court for roughly three years after it went into effect. However, in 2014, the Constitutional Court of Belgium ruled that despite the merits of the many concerns raised in legal challenges—namely, that the law infringed on the religious liberty of Belgian women—the court nevertheless concluded that the state's primary interest in public security ultimately trumped these challenges. Similar legislative responses from France and other European nations are representative of larger tensions between secular societies and Islamic religious groups in the wake of terrorist attacks on the World Trade Center in the United States (September 11, 2001) and the London public transport bombings (July 7, 2005). On May 24, 2014, an ISIS-affiliated French national opened fire on the Jewish Museum of Belgium. On March 22, 2016, ISIS-affiliated terrorists attacked the Brussels airport in Zaventem and killed 32 civilians. Between August and October of 2016 there were also several incidents of terror-related violence directed toward Belgian police officers.

Issues

Beauty Standards

Belgian beauty ideals are very consistent with Western conceptions that privilege light skin and fair-colored hair. A number of recent studies have analyzed Belgian beauty standards by examining the types of models used most often in domestic magazine advertisements (De Cort 2010, 261–285). Despite the cultural diversity that exists in Belgium, there is surprisingly little diversity in popular culture beauty ideals. The vast majority of Belgian advertisements feature female Caucasian models with fair-colored hair and skin and light eyes. In one study, researchers found no examples of Asian types in popular culture advertisements and only one that prominently featured African women (265).

Sports and Recreation

Football (or soccer), archery, and judo are among the most popular club sports for women in Belgium. Belgium has won six Olympic gold medals in archery since 1920, and in

the late 20th century, it produced a number of prominent female judo practitioners. Ulla Werbrouck, a gold medal Olympian in judo at the 1996 Olympics, is representative of the prominence and popularity that female athletes in the sport of judo enjoy. Following her 1996 Olympic victory, Werbrouck's widespread popularity contributed to her successful election to the Belgian Chamber of Representatives in 2007 and to the Flemish Parliament in 2009.

Violence and Domestic Abuse

Domestic abuse and violence toward women remain serious topics of concern in Belgium. A 1998 study commissioned by the Ministry of Employment and Labor discovered that 16.8 percent of women reported experiencing repeated acts of abuse and violence throughout their lives (Meier 2008, 485). According to a more recent 2010 survey on domestic violence, 13 percent of Belgian women report having experienced some form of repeated domestic abuse (487). In 2010, there were 57,122 cases of domestic abuse reported to the police in Belgium, and of that number, 45,148 were the result of violence inflicted by a domestic partner (487–489). Belgium is still struggling to address this national social issue, and despite some more recent advances in laws, there are still only 26 shelters for women who are victims of domestic abuse and no national women's helpline (489).

Marital rape, or forced nonconsensual sex between married persons, has only been a crime since 1989. Domestic abuse, or domestic violence, is still not an official criminal offense in Belgium; instead, it is treated by authorities as a form of harassment. In fact, until 1997, sections of Belgian domestic abuse law allowed for justifiable acts of physical abuse that stemmed from revelations of adultery. Such legal language no longer exists, and by 2001, new laws and guidelines were issued that gave courts additional tools to protect women victims of domestic abuse. In 2001, Belgium introduced its National Action Plan against Violence. By 2003, judges had gained the authority to impose restraining orders on spouses, and in March 2006, the minister of justice had signed new Marital and Family Violence guidelines, which mandate that every complaint of domestic abuse must be recorded, investigated, and prosecuted. Despite these recent advances in legal protections, domestic abuse is still a serious issue for women in Belgium.

Rape and Sexual Assault

Violence toward women escalated in Belgium between 2009 and 2011, as the number of reported rapes increased

from 3,360 to 4,038, which represented a rise of more than 20 percent. According to the *International Business Times*, in 2011, more than 11 rapes took place every day in Belgium, which placed the country among the five nations with the highest rates of rape. Despite numerous attempts by women's groups to use these figures to generate more public awareness, there is little indication that the problem has improved.

Human Trafficking

Belgium is a major transit point and destination for the trafficking of young women for sexually exploitive purposes. On April 13, 1995, Belgium's Parliamentary Committee on Human Trafficking passed new provisions that outlawed human trafficking and child pornography (Fitzmaurice 1996). These new laws allowed for the imposition of prison sentences of up to 20 years for those who sexually exploit children and engage in forced labor. Authorities report that, since 1994, the vast majority of human trafficking cases involve the sexual exploitation of women from sub-Saharan Africa, Eastern Europe, and Asia. A majority of these victims of sexual abuse are women under the age of 18. In 2006, the UN Office on Drugs and Crime classified Belgium as a country with a "high incidence" of human trafficking abuses.

It is difficult to measure the extent of human trafficking because there is no uniform system for collecting and collating data on victims of trafficking. However, recent UN reports show that, in 2003, there were 400 individuals convicted of human trafficking-related charges (U.S. Department of State 2011). This number decreased to 362 in 2004 and dropped even further to 281 in 2005. While these figures seem to indicate the effectiveness of new laws, detractors claim that human trafficking is, instead, simply "becoming more invisible" (2011). In 2011, the government successfully prosecuted 170 offenders of sex trafficking offenses and secured prison sentences ranging from less than 1 year to more than 30 years.

Two of the most prominent human trafficking cases occurred less than a year apart in 2001. The first took place in a Labor Court in Liege in September of 2011. Four members of a Romanian family were publicly prosecuted for enslaving young girls into domestic service. In a second case, a diplomat from Sierra Leone was prosecuted for enslaving and torturing three women who were compelled to work at his office (Brans 2006). In the latter case, diplomatic immunity protected the guilty party from Belgian prosecution, but the Belgian government used this case to

create new provisions in child trafficking laws that allow for custody of the children in such cases to be given to the state. These new guidelines also allow victims of abuse to file civil lawsuits against perpetrators to recover damages.

A 2012 government campaign titled Stop Child Prostitution has continued to raise awareness and to provide information to victims of prostitution and human trafficking seeking law enforcement assistance.

Bosnia and Herzegovina

Overview of Country

Bosnia and Herzegovina is positioned in Southeastern Europe, near the Adriatic Sea, in the midpoint of the Balkan Peninsula; it is bordered by the Croatia to the north, west, and south; Serbia to the east; and Montenegro to the southeast. It has a diverse ethnic population estimated at 3.8 million people. The capital of the country is Sarajevo.

Throughout its history, Bosnia and Herzegovina has been influenced by numerous empires and rulers, such as the Roman and Byzantine Empires, the Middle Age Kingdom of Bosnia, the Ottoman Empire, and the Austro-Hungarian occupation at the end of the 19th century. After World War I, Bosnia and Herzegovina became a part of the Kingdom of Serbs, Croats and Slovenes, which was later renamed the Kingdom of Yugoslavia. After World War II,

this country developed into the one of the six republics of the Socialist Federative Republic of Yugoslavia. In light of the referendum of March 1, 1992, Bosnia and Herzegovina declared independence on March 3, 1992, and became a member of the United Nations on May 22. Unfortunately, as a result of the war in Bosnia and Herzegovina (1992–1995) that followed, half of Bosnia and Herzegovina's pre-war population of 4.2 million was displaced internally and externally. Additionally, more than 100,000 people went missing or were killed, and most of its infrastructure and economy was destroyed. The Dayton Peace Agreement, which was signed on December 14, 1995, ended the war (although it also created a complex and expensive governance system in the process).

Bosnia and Herzegovina consists of two entities: the Federation of Bosnia and Herzegovina and Republika Srpska and Brcko District. According to estimates from the Agency for Statistics of Bosnia and Herzegovina, cited by the United States Department of State, "Muslims represent 45 percent of the population; Serb Orthodox Christians, 36 percent; Roman Catholics, 15 percent; Protestants, 1 percent; and other groups including Jews, 3 percent. Bosniaks are generally associated with Islam, Bosnian Croats with the Roman Catholic Church and Bosnian Serbs with the Serb Orthodox Church" (International Religious Freedom Report for 2011).

Gender equality issues, including the legislation regarding gender equality, are a complex and evolving part of the culture. In the case of Bosnia and Herzegovina, gender issues are very different in terms of the EU's framework of gender equality compared to the views of gender equality in the Balkans. The end of the war in Bosnia and Herzegovina marked the beginning of a double transition that is still going on: a transition from war to peace in all aspects of society and an economic, social, and political transition. According to the UN Development Programme's (UNDP) *Human Development Report*, Bosnia and Herzegovina is ranked 86th out of 187 countries based on the Gender Inequality Index (GII; 0.201).

Girls and Teens

Women in Bosnia and Herzegovina still face discrimination. They do not have the same freedom as men do to exercise their rights. However, in recent years, the protection of women's rights in Bosnia and Herzegovina (BiH) has significantly improved. There is a Law on Gender Equality (2003) and a Gender Action Plan (2013–2017)

at the BiH level, and in 2013, the BiH Election Law added a 40 percent gender quota. Additionally, there have been recent additions of entity-level legislation and public policies for preventing and combating domestic violence. Bosnia and Herzegovina has signed and ratified all major international documents regarding women's human rights, including the Council of Europe Convention on Preventing and Combating Violence against Women and Domestic Violence (Istanbul Convention) in 2013. Despite these positive measures, positive changes have not immediately set in; women are still deprived of many of their rights, both in their personal and professional lives, and the relationship between the government and nongovernmental organizations (NGOs) is still far from ideal in terms of protecting women's rights. As of yet, many of the advancements for women in BiH society still exist on paper more than in reality (Fransoli 2014).

The most common forms of abuse in the country include discriminatory employment practices, harassment at the workplace (such as nonphysical harassment geared toward humiliating individuals), limited access to maternity rights, and unequal treatment of women who live in rural areas or are otherwise more vulnerable. Women also remain underrepresented in government institutions at all levels, and gender-based violence—including human trafficking and domestic violence—are also significant issues in Bosnia and Herzegovina. Ongoing gender stereotypes and prejudices also have widespread consequences in ensuring gender equality. Roma women, women with disabilities, refugees and internally displaced women, women in the sex industry, and lesbian, bisexual, and transsexual women all face significant challenges in Bosnia and Herzegovina.

The Agency for Statistics of Bosnia and Herzegovina supervises the social profile of the population and matters such as birth and mortality rates; youth and general employment; education; poverty and expenditure; and industry, among others. Bosnia and Herzegovina is currently a state with low birth rates and a large late-middle-aged population, as shown by the following facts. Boys 17 years old and younger are more numerous than girls of the same age, even though Bosnian-Herzegovinian society is 51 percent women and 49 percent men. Girls aged 5 years and younger are 5.4 percent of the population, and girls aged 6–17 are 14.6 percent. The abovementioned numbers represent percentages referring to the total population of Bosnia and Herzegovina. Data from the *Household Budget Survey in BiH, 2011*, shows that women older than 65 do

not surpass the number of girls and teens, and the largest age group is 35–64, which is 41.3 percent.

Bosnian-Herzegovinian youth are highly concerned with gender politics, unlike their elder fellow countrymen and countrywomen, due to the influence of the Bosnian War of 1992–1995.

Education

Only primary education is an obligation in Bosnia and Herzegovina by law; preschool and secondary education are not (Education Reform Initiative of South Eastern Europe 2016). The data from UNICEF and the UNDP investigations on secondary school attendance show different figures. According to UNICEF, secondary school enrollment is only 79 percent, which is low compared to 98.4 percent of primary education enrollments (UNICEF Bosnia and Herzegovina 2015). The UNDP states that secondary school attendance has improved substantially, from 68.3 percent in 2000 to 91.8 percent in 2011, as has the enrollment rate for higher education, from 23 percent in 2000 to 38 percent in 2011 (UNDP in Bosnia and Herzegovina 2015a).

In all three education levels, boys outnumber girls. For example, in the 2012–2013 school year, there were 9,859 boys and 8,958 girls in preschool institutions, 156,296 boys and 148,585 girls in primary schools, and 84,420 boys and 82,242 girls in secondary schools. The numbers of girls and boys in preschool and secondary school education have shown a tendency to grow since 2008. However, the number of all students in primary schools is going down every year. This aspect of social life, like all others in Bosnia and Herzegovina, is determined by poverty issues. This is especially noticeable in rural areas, and it influences educational quality, too. Interestingly, female students are more numerous than male in higher education. In the 2012–2013 school year, 55.12 percent of enrolled students were female, and in 2012, 60.4 percent of graduated students were women (UNDP in Bosnia and Herzegovina 2015b).

This information shows a slight underrepresentation of girls in school due to economic problems, which are inevitably linked to political issues from the late 1990s.

Recreation

The same can be said of the number of girls active in sports in BiH. Generally, women and men in Bosnia and Herzegovina are attracted to sports for different reasons.

Men often like the competitive aspects provided by sports, and women have more interest in remaining in good shape and being healthy. Women are particularly attracted to sports in which bodily expression is highest (dancing and aerobic), while men are often attracted to martial arts, team sports in big terrains (football), or other sports that require great endurance. Although there are many Bosnian-Herzegovinian teenage girls who show significant results in many different sports (such as judo, tennis, rhythmic gymnastics, badminton, football, karate), that number is usually far lower than the number of teenage boys. It is often believed that men are stronger and are consequently more capable in achieving the best results.

It is important to say that the government of BiH displays little economic support for such matters regardless of gender groups. There is also the image of certain sports being “male,” such as judo, football, and karate; this perception is often created by society. Women and girls in these sports, though very successful, are at the same time in danger of becoming labeled as “tomboys” and having their sex or gender identity questioned because they do not fit the categories in which society has placed them (Radin 2011). Unfortunately, the actual number of girls and teenagers involved in sports is uncertain, but perhaps it is safe to say that it is larger than the number of middle-aged women who engage in sports.

Everyday life for teenagers in Bosnia and Herzegovina is not different than that of teenagers in the West. Today’s teenagers are more educated than previous generations, and they tend to question and test almost everything. Moreover, today’s teenagers in Bosnia and Herzegovina use all types of technological products both at school and at home. They are one of the main target audiences for all kinds of social media, and they are spending most of their leisure activities on social networks.

Health

The definition of *gender equality* in terms of health means that there are equal opportunities for both genders to enjoy their right to pursue a healthy life, which includes equal access to quality healthcare services. Women’s rights are defined by international treaties and documents that concern human rights. Gender equality in the field of health is defined under Article 13 of the Law on Gender Equality of BiH. The Gender Action Plan of BiH, under Chapter 10 (Health, Prevention and Protection), stipulates goals and actions for the improvement of gender equality in terms of

health. The section “45 Reproductive Rights” has traditionally been the focus of gender equality policies.

The Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) committee made recommendations to BiH in an effort to improve the access that females have to receive quality sexual and reproductive education information. These recommendations were made in the hope of reducing the number of abortions and sexually transmitted diseases (STDs) and increasing the use of contraception in the country. Very little is currently done to provide young people with adequate information, possibly due in large part to the country’s traditional and religious influences. UN agencies often assist by providing support to certain segments of health and healthcare services. One example is the UN Population Fund (UNFPA), which offered support counseling to improve sexual and reproductive health of both young women and young men. However, the efforts were too limited to enact significant improvements, and no notable effect has been seen on a wide community level. Counseling has reportedly been met with some resistance due to Bosnians’ traditional values and did not attract large numbers of young people.

Recent research (Milinović 2013, 24) has shown that women in their early twenties do not show much difference in attitudes toward conception than women between the ages of 45 and 49, which suggests that modernization in the private sphere has been unsuccessful in destigmatizing safer sex practices. Aside from sexual and reproductive health, smoking is another health concern for citizens in BiH. In general, smoking has been a bigger problem for men than women; 21.6 percent of women between the ages of 15 and 19 have sometimes smoked, compared to 28.7 percent of men. For older adults, between the ages of 45 and 49, 58.6 percent of women and 76.6 percent of men reported currently or previously smoking.

Another challenge for women in Bosnia and Herzegovina is that access to healthcare and health insurance is defined by entity laws. All areas of the country, according to a GEA review, have provisions that guarantee equal treatment of women and men. However, the differences between entities can create differences and gaps in health treatments. As indicated in the CEDAW Report for BiH,

due to the exceptionally complex institutional framework, poverty, lack of funding and insufficient coordination among different levels within the systems of social welfare and healthcare the scope of social rights, in spite of their being safeguarded by both the legal

framework and international documents and conventions, which have the same legal force as the constitutional provisions, does raise the issue of actual access to and the practical use of all legally defined rights for men and women in BiH. (CEDAW Report 2011)

Specific groups of the population considered to be more vulnerable or with higher need for healthcare (such as pregnant women, mothers, infants, children, teenagers, the elderly, the homeless, the unemployed, and drug addicts) receive some degree of special protection measures, which are generally related to social welfare transfers.

In terms of employment in health professions, women are the majority of health professionals, although females are underrepresented at the management level. In a private sphere, they are also restricted to working as care providers. Both men and women are vulnerable to issues in exercising their rights in terms of healthcare options because many lack strong knowledge about healthcare regulations. As it is in many other countries, healthcare in BiH is a very complex field and requires numerous regulations, all of which are best understood by someone with a fairly advanced knowledge of the subject. The CEDAW report illustrates that no services exist to protect beneficiary and patient rights in this regard (Arsenijević and Flessenkamper 2013).

A vast majority of healthcare services are currently located in cities, so the number and quality of institutions, staff, and equipment vary greatly between rural and urban healthcare services. This presents rural citizens with more challenges in accessing quality healthcare. Data regarding health issues is not represented accurately according to gender, except in terms of causes of death. Within the context of Bosnia and Herzegovina health data, specifically, more data collected on a regular basis would be required to gain an in-depth and more accurate view of men’s and women’s health.

Employment

Bosnia and Herzegovina has a high unemployment rate, which is again the result of unresolved political and economic issues dating to after the Bosnian War and is especially evident in the last decade. Thus, there is a lot of employment on the black market as well as high unemployment of youth (45%–50%). Reports on this data can vary; the UNDP claims that number is 60 percent. From 2010 on, the numbers vary slightly, particularly comparing

official with what are thought to be actual rates. The latter is lower because many technically unemployed persons work in the gray economy, which is an area of the economy that is not accounted for in official statistics (Index Mundi 2015). According to the UNDP in BiH, the total unemployment rate defined by the International Labour Organization (ILO) is 29 percent, while the official or registered unemployment rate is 46.1 percent.

In BiH, women are outnumbered by men in the employment section. In 2013, the number of unemployed women was 199,786, which is 2.72 percent higher than the year before (Sarajevo: Federal Employment Institute 2014). The same sources report that women make up the majority of workers in the public health sector; more than 90 percent of pharmacists are women, and more than 80 percent of nurse technicians are women. The number of women (21,546) and men (6,653) in this employment area indicate this field is a common career choice for women. Similarly, employees in the social welfare institutions and institutions for children and adolescents without parental care are mostly women, surpassing men by almost three times in these fields. The same can be said for the teaching profession: women outnumber men as teachers in preschool and primary and secondary schools, but there is a larger number of male lecturers in higher education (Sarajevo: Federal Employment Institute 2014).

Women are mostly employed in services and major and minor trades, while men usually work in light industry and manufacturing, construction, traffic, financial management, and public administration (Bašić and Miković 2012). Thus, labor market analyses show that there are typical male and female professions and indicate the presence of a slight gender gap in wage levels in the private sector, where males earn slightly higher wages than women. In the official statistics of the BiH labor market, the “gender gap” is not really mentioned nor calculated, though its practical existence was confirmed by the first research on wage gaps for men and women in BiH. Differences in wage levels for men and women are highest in the nonindustrial sector and smallest in administration.

Maternity leave in BiH ranks low in the state budget and is not supported by employers, especially in the private sector. That is also one of the reasons why there is negative population growth and employment. Privatization, the dying out of industrial centers, the stagnation of the economy, the large available workforce in the labor market, constant rising prices, and other factors bring poverty to a large number of citizens of BiH. Many of those have lower

education and employment levels, which reflects particularly negatively on women (Bašić and Miković 2012).

Women in High Positions

When it comes to engagement in the political life of state and public administration, it is important to note that the number of women is very low compared to men. In the sex structure of the Parliament of BiH, women are only 19.3 percent to men's 80.7 percent. An almost equally large gender gap is visible in the House of Representatives of BiH (women 21.4%, men 78.6%) and the House of People of BiH (women 13.3%, men 86.7%).

Based on the facts given by the Ministry of Foreign Affairs of BiH, there was a slow increase in the number of women appointed as ambassadors or other representatives in the diplomatic and consular offices of BiH from 2008 to 2012. In 2008, the ratio between women and men was 8:41, and in 2012, it was 12:42.

Family Life

Bosnia and Herzegovina has a primarily patriarchal family structure today, which is also a postconflict consequence. The typical way of life of a traditional Bosnian-Herzegovinian family includes youths living with parents until they get married. This is a centuries-old custom, supported also by the fact that the majority of the population is impoverished. This type is known as the nuclear family (parents with children), but there is also the extended family type, which is not as numerous as before and more common in rural areas. Shown by the *Household Budget Survey in BiH, 2011*, 35.7 percent of population in this country is poor (18% of men and 17.7% of women). As a result, young people today do not dare to enter marriage easily; thus, the negative rate of population growth highly affects family as the social nucleus. On the other hand, exceptions to such ways of life do exist, and there are a significant number of young people (a large number of young women among them) living by and providing for themselves (Spahić-Šiljak 2012). Partnerships without legal obligations are acknowledged by the laws of Bosnia and Herzegovina, equal to marriage, and considered as a free way of living between a man and a woman (Huremović, Gavrić, and Savić 2011).

Traditionally, society in this country has been matrimonial. Some research has shown that this practice has recently changed, but matrimony is still regarded as the ideal outcome in one's personal life. The freedom of choice

of a future partner was valued even in the last hundred years or more, but it was sometimes determined by other family members (Younis 2006). This way of life is very rare today; men and women tend to enter into marriage by their own free will. According to some statistics that encompass approximately the last 11 years, Bosnian-Herzegovinian women and men marry later in life. The groom is usually around 29 years old and the bride 26 years old when forming their first marriage (Sarajevo: Federal Employment Institute, 2014). The country has seen rising divorce rates and an increase of single-parent and single-household families (Family Counseling Center Sarajevo 2015). According to a *Household Budget Survey in BiH, 2011*, Bosnia and Herzegovina's single-parent population consists of around 85 percent of single mothers and 15 percent of single fathers (Sarajevo: Federal Employment Institute, 2014).

In regard to official statistical data on marriage, divorce, cohabitation, and the problems of children whose parents enter into new matrimonial relations after a divorce, some experts in family pedagogy take on the conclusive viewpoint that the happiness of the freedom of choice brought some new challenges and pressures for BiH society (Alić 2012). The patriarchal frame of the family also determines the difficult position of LGBT persons in Bosnian-Herzegovinian society and state. Thus, any family that is different from the typical, traditional union between a man and a woman (marriage or domestic partnership) that is supported by family laws in BiH is considered undesirable. LGBT rights are not encouraged by the state or society. Marriage and the adoption of children are not possible for couples of the same sex (Milinović 2013).

Structurally, the most frequent nuclear family sizes in BiH are composed of four (52%), five (20.4%), three (19.9%), six (6.3%), or more members (1.4%) (Spahić-Šiljak 2012).

Politics

The percentage of women in politics, in legislative and executive authorities at all levels, remains disappointing. In 2011, only 19 percent of women were represented in the Parliament of Bosnia and Herzegovina, 21.4 percent in the House of Representatives, and 13.3 percent in the House of Peoples of Bosnia and Herzegovina (Milinović 2013). In the 2008 elections, the electorate was composed of 49 percent women and 51 percent men; 64.8 percent of men and 35.2 percent of women accounted for political candidates. In terms of elected officials, 85 percent were men, and only

15 percent were women. Very few mayors were women, only 2.86 percent. In 2011, only 9 (15.5%) out of 58 ambassadors and general consuls in the diplomatic and consular offices of BiH were women. However, court personnel positions are often held by females. Women accounted for 43.1 percent in the Court of BiH, and 67.5 percent in the municipal courts. In 2009, only 6.3 percent of police officers were women. The proportion of men to women employed in public administration in Bosnia and Herzegovina shows just about the same ratio between civil servants in the Federation of Bosnia and Herzegovina and Republika Srpska. The number of men in important roles is rising, such as managers, assistant ministers, chief inspectors, and so on (Arsenijević and Flessenkamper 2013).

To confront these gender imbalances, there has been an increase of preelection activities to raise awareness of women's participation in all political branches. The Election Law of Bosnia and Herzegovina requires a 30 percent quota of female representatives in elected political bodies. The gender mainstreaming mechanisms have begun to actively support and provide different kinds of training for political parties.

Religious and Cultural Roles

In Bosnia and Herzegovina, there are 12,900 civil society organizations (CSOs), but the number of active women's nongovernmental organizations (NGOs) is in fact unknown. Many human rights organizations in Bosnia and Herzegovina also cover women's issues (European Commission 2014). Women in Bosnia and Herzegovina are far more involved in civil society than in formal politics, a phenomenon that is thought to be due to a disproportionate distribution of power. It is important to underline the positive trends in women's participation in civil society and the women's movement in the contemporary Bosnia and Herzegovina's context.

Women activists in Bosnia and Herzegovina display a high level of critical awareness in assessing their own actions and goals, which often indicates their political and social maturity as well as the importance of commitment in struggling for common good but also for their rights. Women's groups often mobilize entire populations, working across ethnic and racial borders. Through different types of activities, women in civil society in Bosnia and Herzegovina create an atmosphere for perceptible, conventional, and unconventional forms of social, cultural, and political participation. They often use the approach of

negotiating gender in the context of a postwar and post-trauma society. According to CEDAW report, most activities of women in CSOs were related to domestic violence, health, prevention and care, education, safety, gender-sensitive budgeting, and other similar fields.

Bosnia and Herzegovina is a meeting place of cultures, civilizations, and peoples whose existence is derived from and largely shaped by their religions. For this reason, Bosnia and Herzegovina is a “meeting point” of religions. Relations between religions in Bosnia and Herzegovina are reflected in almost all aspects of social and cultural life. Religion and cultural heritage are important factors in the formation of an identity, system of values, and lifestyles. The position of women within cultural and religious context in Bosnia and Herzegovina is often very complex. Today’s women struggle with the opportunities and challenges of a fast-changing technological society, while also seeking to protect their rights.

Even though much has changed in recent years, and although women in Bosnia and Herzegovina have begun to reject the deeply rooted concept that women “belong at home” and that men are the only “real breadwinners,” women are still far from being considered equal to men. Discrimination in the workplace is seen as a part of everyday life and of every society, including Bosnia and Herzegovina, which is why it is more difficult to identify and sanction it. The unfavorable position of women in the labor market is closely associated with the unfavorable status of women in family life and the still-traditional understanding of the role of women in the family. Most of the housework and responsibilities of family and children are solely the responsibility of women, regardless of whether they are employed, what they have to do at work, or how much they earn. Discrimination against women in the labor market persists, and women are more disadvantaged than men when it comes to employment, position in the workplace, and career choices. Women’s poor economic situation is directly related to limitations in access to education.

Although there has never been a Bosnian-Herzegovinian (and the entire Balkan region) equivalent to the Western women’s emancipation movement, many women have taken a more active stance by the private necessities of economic survival and parenting. Largely unnoticed by men who tend to hold to old stereotypes of the Balkans, women in Bosnia and Herzegovina today are accomplishing significant feats. During modern-day economic crises, women are often the ones leaving their homes to earn money in the West for their families, typically in low-paying menial jobs.

The wife provides the money, and the husband tends the children—traditional roles have been switched.

Sexism is still an everyday experience for women in Bosnia and Herzegovina in their workplaces, in public, in commercials, and in politics. Media in the Balkan countries often reduce women’s importance to their bodies and looks. Famous female pop singers in the region aspire to be sex symbols and are the figureheads of widespread trends: suggestive dresses, dolled-up appearances, and folk music with accordions.

Roma Women

Although the socioeconomic situation is difficult for most citizens of BiH, the Roma population lives on the margins of society. It is beyond question that over 65 percent of Roma people have no roof over their heads, 70 percent have no access to health care or social protection, over 90 percent are unemployed, and Roma children drop out of mandatory elementary schools due to poverty (Milinović2013). Considering the addition of prejudice and discrimination against Roma to these challenges, it is hard to belong to the Roma community. Roma women are discriminated against based on their affiliation with the Roma ethnic minority, based on sex and their social background or status (Radin 2011). Generally, members of the Roma community in Bosnia and Herzegovina still constitute one of the most marginalized groups in society, which makes Roma women susceptible to discrimination on two levels—as women and as members of the Roma population.

Roma women and girls have a very difficult position in BiH society. The 2012 *Progress Report of the European Commission* showed that very little progress has been made to improve the discrimination and domestic violence that Roma women and their children endure. There are many indicators that show a profound social exclusion for the Roma people in BiH society, many of which start at birth. For example, many Roma children do not receive birth certificates, increasing their risk of trafficking. The *Multiple Indicator Cluster Survey* (MICS), a survey that collects data on areas that are considered to be key indicators of the well-being of women and children, determined that 20 percent of Roma children did not receive birth certificates (MICS 2011–2012). The Roma MICS showed that, for almost all indicators, the situation of Roma was significantly worse than it was for the general population (2012). Many Roma in Bosnia and Herzegovina are considered to live in deep poverty, which is generally due to

the discrimination they face trying to secure jobs and ethical working conditions.

Many Roma also have low educational levels, which are linked with high rates of unemployment and poverty. Women have high rates of illiteracy, and Roma girls have low rates of attendance in primary and secondary school. A UNDP study (MICS 2011–2012) discovered that nearly 80 percent of Roma women had not completed primary school, and only 4.5 percent of Roma women had completed secondary education, compared to the higher (but still low) 9.2 percent of Roma men. According to the survey, only 47 percent of Roma girls were enrolled in primary education. Additionally, roughly 90 percent of Roma women have no access to healthcare, social protection, or employment. The Alternative CEDAW Report for 2010 quoted a nationwide survey showing that almost 82 percent of Roma women were unemployed, 9 percent were working in the informal sector, and 7 percent resorted to begging to meet their needs for survival. Few Roma (2%–3%) were employed in the private sector (MDGs 2013). The Roma Education Action Plan and other initiatives of Bosnia and Herzegovina to promote education do not specifically address the considerable needs of Roma women and youth.

Lesbian, Bisexual, Transgender, and Transsexual Women

At the end of the war in Bosnia and Herzegovina, numerous efforts to increase gender sensitivity began. Lesbian, gay, bisexual, transgender, transsexual, intersexual, and queer (LGBTTIQ) activists started to gather officially during a rise in peacemaking work, the opening of academic programs, and lobbying for legislative amendments. The LGBTTIQ movement in Bosnia and Herzegovina recorded its beginnings in 2001, when the establishment of a BiH lesbian-gay association was initiated.

Lesbians in BiH have been doubly vulnerable in society—as women and as sexual minorities—and are still not adequately empowered to be able to separately organize themselves and provide support to one another. Regardless of the fact that similar organizations exist in neighboring countries and that lesbians from these countries have frequent and good cooperation with organizations in Bosnia and Herzegovina, there have been no significant initiatives for the lesbian movement in Bosnia and Herzegovina to date. There has been an evident lack of interest within the women's movement for such initiatives (Čaušević 2014).

Although transgender and transsexual women face numerous additional problems in Bosnia and Herzegovina

society, such as violence, lack of understanding, rejection, and discrimination, there are no adequate legal solutions in Bosnia and Herzegovina for the implementation of basic human rights for this social group, nor any significant initiatives. As a result, trans women are marginalized in society. The lack of opportunities for discussion, and particularly for action, creates what many consider to be an unsafe environment and lack of understanding regarding members of sexual minorities (Čaušević 2014).

Violence and Gender

Domestic Violence

Recent studies indicate that women and children in BiH are the victims of domestic violence at a rate of five times more often than men. The statistics on domestic violence in the country are thought to have significant gaps due to some victims' failure to report cases of the violence, a lack of uniform statistical records, and the culturally held view that domestic violence is a problem that should be dealt with privately within families. To improve issues of domestic violence in the country, UN Women, UNFPA, and UNICEF have pooled funds allocation from the FIGAP program (Financial mechanism for the Implementation of the Gender Action Plan in BiH) with the BiH Gender Equality Agency and undertaken the first Prevalence Survey on Gender-Based Violence in BiH. Approximately half of the women surveyed (47.2% in BiH and 47.3% in RS) reported experiencing at least one form of violence since the age of 15.

Recent research indicates that many women in the country lack an understanding about different forms of violence, including those forms that they have experienced personally. BiH has nine shelters, also known as safe houses, for women who are victims of domestic violence. International organizations and UN agencies provide support to these shelters, such as the introduction of laws in Republika Srpska to fund shelters from the RS budget (70%), and from the budgets of local communities (30%). More advancements are expected from amendments being proposed to the Law on Protection against Domestic Violence in the Federation of BiH (UNDP in Bosnia and Herzegovina 2015b).

Trafficking

Human trafficking is a specific form of violence, one that was exposed in Bosnia and Herzegovina during the

1992–1995 war. This country is used as a source for trafficking as well as a trafficking transit country due to its specific geographical position. According to the *Annual Report on Trafficking in Human Beings 2010*, 19 victims of trafficking were reported in 2007, a number that rose to 60 victims in 2010. Of those victims, 52 were citizens of BiH, 4 were from the Ukraine, and another 4 were from Serbia. According to the United Nations in Bosnia and Herzegovina's report, "in 2009 BiH adopted an amendment to the Criminal Code determining a minimum sentence of three years of imprisonment for trafficking in human beings." However, in the years since, the number of convictions has stayed low, suggesting an insufficiency of the law. In 2012, the most common forms of human trafficking were found to be sexual abuse and forced begging; 3 cases of forced sales into marriage and 3 cases of forced prostitution were also cited. That same year, 92 percent of the 39 victims of trafficking reported were women, only 10 percent of whom were adult victims. In 13 cases, victims were provided access to shelters (Milinović 2013).

War Crime Victims

Reports by female victims of wartime rape and other sexual violence have pointed to negligence on the part of the state's lack of outreach and efforts to provide for their needs in the aftermath of the 1992–1995 war. BiH, as a state, has failed to provide services in general; NGOs and women's organizations have been responsible for providing support to victims and encouraging them to testify against the perpetrators. Female victims of war crimes that were sexual in nature have also reportedly been socially outcast, excluded, and marginalized. In many cases, women did not speak out for a decade or longer (if at all); members from the organizations who help these women continue to interview victims who have stayed silent for up to 20 years. Due to the trauma and ensuing stigma they have faced, those who survived sexual violence during the war struggle with poverty and unemployment, and many problems have been passed down to the younger generation as a result.

There are very few reported cases of wartime rape and sexual violence; approximately 30 cases have been resolved to date. Estimates vary; some believe that somewhere between 20,000 and 50,000 people were victims of wartime sexual violence in BiH. A continuing problem for some female victims is that the perpetrators who harmed them live in the same communities and are part of their daily life; many are afraid for their safety. Many have stayed

silent because they do not want their husbands and children to know about the events that transpired or they fear of being socially outcast. As of 2011, 75 war crime cases that included instances of sexual violence against women received final verdicts by the Court of Bosnia and Herzegovina. Of those verdicts, 29 (38.6%) were rendered for war crimes, including acts of sexual violence against women (UN Human Rights Council 2013; Milinović 2013).

HIV/AIDS

Bosnia and Herzegovina has a low prevalence of HIV; it is estimated at less than 0.1 percent of the population. According to BiH reports to the European Centre for Disease Prevention and Control (ECDC), 221 cases of HIV infection and 120 cases of AIDS were registered as of 2012, and the infection ratio in BiH was 5 to 1 (male/female). Data has also shown that the most common form of transmission of HIV in the country is through heterosexual sex (52%) and that 81 percent of reported HIV infections have been men. Only one case of mother-to-child transmission (MTCT) has been registered, reported in 2006. The antiretroviral therapy (ART) began in 2007 through the public health care system; 74 people were receiving ART in recent years. There is a shortage of ART options in the country, support for which is being provided by an organization called Global Fund to Fight AIDS, Tuberculosis and Malaria, implemented by the UNDP.

Despite an overall low prevalence of HIV/AIDS in the country, a great deal of effort has been put into the prevention and detection of HIV/AIDS in the country. Free voluntary and confidential testing and pre- and postcounseling was established in 2005 in BiH, carried out by a group called the Voluntary Confidential Counselling and Testing Centres (VCCTC), which has successfully increased the number of people in the country who have been tested. There are 22 of these centers across the country, and they have targeted their efforts at the population groups thought to be most at risk. Ten health centers regularly provide sterile needles and syringes to cut down on drug users' transmissions, and they also distribute condoms, give out HIV/AIDS information, and make referrals to VCCTC.

Similar to many other countries going through significant transitions, BiH faces the serious challenge of increased numbers of sex workers, sexually transmitted diseases, and the prevalence of drug use. This increases the number of vulnerable population groups in BiH who need access to health insurance and diagnostic and treatment

options for HIV/AIDS (UNDP in Bosnia and Herzegovina 2017).

Bulgaria

Overview of Country

The Republic of Bulgaria is a parliamentary democracy located on the Balkan Peninsula in southeastern Europe. The geographic location of Bulgaria offers access to Western Europe, the Near East, and Middle East, as well as the Mediterranean. The country is named after the Bulgar tribes who migrated to the lower Balkan area in the seventh century CE. After World War II, Bulgaria was influenced by the social and economic beliefs of the Union of Soviet Socialist Republics (USSR), and, in 1946, the Bulgarian Communist Party became the dominant political force in the country. After the collapse of communism in 1990, Bulgaria embarked on a difficult process of transitioning to a multiparty democracy with a market economy, while contending with political instability, strikes, corruption, and various economic issues, such as inflation and unemployment (CIA 2016).

Bulgaria is bordered by five countries—Greece, Macedonia, Romania, Serbia, and Turkey—as well as the Black Sea. The Central Intelligence Agency (CIA) estimates Bulgaria to be slightly larger than Tennessee, with a total area of 110, 879 square kilometers. When the sum of all land and water areas are measured, Bulgaria is ranked as the 105th largest country (out of 257) in the world, and falls between Liberia (104) and Cuba (106) (CIA 2016).

Bulgaria is divided into 28 providences, and the capital city is Sofia, which is located in the western section of the country. The majority of the population self-identifies their ethnicity as Bulgarian, at 76.9 percent, with 8 percent also identifying as Turkish, 4.4 percent as Roma, 0.7 percent as other (including Russian, Armenian, and Vlach), and 10 percent as unknown (CIA 2016). Minority groups in Bulgaria include, but are not limited to, Turks, Roma, Russians, Armenians, Vlachs, Macedonians, Greeks, Ukrainians, Jews, Romanians, Tatars, and Gagauz. Additionally, 76.8 percent of the population reported their primary language to be Bulgarian, which is the official language of

the country (CIA 2016). Bulgaria has a total population of 7,168,000 people, with roughly 1,222,000 of those individuals residing in Sofia. Moreover, in 2014, nearly 75 percent of the population resided in urban areas. A growing trend in Bulgaria is the migration from rural areas into urban settings. From 2010 through 2015, the annual population growth rate was –0.8 percent (UN Department of Economic and Social Affairs 2016). When Bulgaria's average annual growth rate was compared to other countries, Bulgaria's was ranked at 225th out of the 233 countries surveyed (CIA 2016). This ranking indicates that, relative to other countries, the Bulgarian population is decreasing at a faster rate than many of the other countries examined.

Bulgaria has a temperate climate. Specifically, the country experiences cold damp winters and hot dry summers. Moreover, 46.9 percent of the land is utilized for agricultural purposes, and 36.7 percent is designated as forest (CIA 2016). Bulgaria has a predominantly mountainous terrain, with lowlands in the north and southeast. The country contains a variety of natural landmarks, including caves, waterfalls, and alpine forest. In addition, it is the second-greatest biologically diverse country in the European region, with 12,360 plant species and 3,700 mammal and vertebrate species (Official Tourism Portal of Bulgaria 2016). There are three national parks located in the country: Central Balkans National Park, Rila National Park, and Pirin National Park. Arable land, bauxite, coal, copper, lead, timber, and zinc are the most abundant types of natural resources available. Given the terrain and typical climate in Bulgaria, earthquakes and landslides are the most frequent types of natural disasters. There have been several types of environmental issues, including air pollution from industrial emissions, deforestation, rivers polluted from raw sewage, and forest damage from air pollution and acid rain (CIA 2016).

In terms of international memberships and involvements, Bulgaria has been a member of the United Nations since December 14, 1995, and the European Union since January 1, 2007. The country participates in numerous international organizations, including the North Atlantic Treaty Organization (NATO), the Euro-Atlantic Partnership Council, the Organization for Security and Cooperation in Europe, the International Monetary Fund (IMF), the World Bank, and the World Trade Organization (WTO) (U.S. Department of State 2015).

Gender Inequality

Gender inequality is a global concern and presents a significant obstacle for healthy development. Notwithstanding

the fact that there have been global gains in gender equality since the 1990s, there are still advancements to be achieved (UNHDR 2015). In response to this international gender-related issue, the UN *Human Development Report* developed a multidimensional Gender Inequality Index (GII) to assess gender inequalities in three critical aspects of human development. Specifically, the index examines reproductive health, empowerment, and economic status. The primary purpose of the GII is to highlight the human development costs of gender inequality and to facilitate global, regional, and national policy discussions. In considering gender equality in Bulgaria, the country received an overall GII of 0.212 and was ranked 44th among the 155 countries surveyed in 2014. GII values range between 0 and 1, with higher values signifying heightened levels of gender inequality. By comparison, the United States had a GII of 0.28.

In reviewing the three indexes of the GII, the *Human Development Report* indicated that, in assessing reproductive health, the maternal mortality rate in Bulgaria was 5 deaths per 100,000 live births (UNHDR 2015). Furthermore, the adolescent birth rate was 35.9 per 1,000 women between the ages of 15 and 19. Moreover, the empowerment measurement examined the proportion of parliamentary seats filled by women as well as the overall proportion of adult females and males over the age of 25 with at least some secondary education. In total, 20.4 percent of parliamentary seats were occupied by females, and 93 percent of women over the age of 25 had at least some secondary education when compared to 95.7 percent of men. In terms of economic status, 47.9 percent of Bulgarian females 15 years of age and older participated in the labor force, while 59 percent of males of a comparable age were employed in the labor force. The *Human Development Report* assesses current levels of gender equality, but it should be noted that the GII does not examine history and duration of gender-related disparities (UNHDR 2015).

Girls and Teens

While the average age of Bulgaria's citizens is 42.1 years, approximately 14 percent of Bulgarians (male 538,266 and female 505,927) were 14 years of age or under, and nearly 10 percent of the population (male 373,340 and female 341,507) fell within the age range of 15–24 years (CIA 2016). Moreover, there were 8.66 infant deaths per 1,000 live births in 2015. When Bulgaria's infant mortality rate was compared to that of other countries, Bulgaria was ranked 150th out the 224 countries examined. This

rating indicates that Bulgaria had a lower infant mortality rate than nearly 67 percent of the countries surveyed (CIA 2016). Furthermore, the estimated life expectancy at birth was 74 years of age in 2012 (WHO 2015). From 2002 through 2012, 1.6 percent of adolescents were married or in union (UNICEF 2014).

The Child Protection Index (CPI) was established to facilitate the development of more effective child protection policy for national governments and international stakeholders (ChildPact 2016). In particular, this index evaluates countries' child protection reforms in correspondence with the UN Convention on the Rights of Children's (UNCRC) system-based method. Bulgaria had a total CPI score of 0.385, which places Bulgaria in fourth position out of the five pilot countries measured (Serbia, Romania, Moldova, and Georgia). While Bulgaria ranked highly in 2 of the 15 quantitative indicators of child protection status (gross domestic adoption rate and expenditure on social benefits), the country was positioned last on 6 quantitative indicators, for example, "a low rate of children between the ages of 0–2 placed in residential care," "low percentages of children with disabilities who have been placed in foster care or adopted through domestic adoption," "low percentages of children 7–17 adopted through domestic adoption," and "a lack of qualified social workers and judges specialized to work on addressing children's issues" (ChildPact 2016). Furthermore, Bulgaria also placed fourth on the "percentage of children placed in foster care out of the total member of children separated from their families at the end of the year" (ChildPact 2016). This ranking suggests that the Bulgarian foster care system is not effectively institutionalized.

However, despite these significant challenges, UNICEF executive director Anthony Lake recently praised the government's continued progress in improving the lives of children (UNICEF 2014). Bulgaria has put forth some effort to align their child protection laws and policies with EU mandates. The Bulgarian government, for instance, created the Child Care System Reform, which has resulted in an 80 percent decrease in children being raised in residential facilities from 2001 to 2014 (UNICEF 2014). In particular, there were 2,700 children in residential facilities in 2014 as compared to 12,600 children in 2001.

Education

At the turn of the 19th century, Bulgaria had approximately a 14 percent literacy rate for women (Todorova 1994, 132). However, by 1937, the literacy rate for women had sharply

increased to 57 percent. In a similar vein, over 20 percent of students in higher education in 1937 were women. Current surveys indicate that 98.4 percent of the population 15 years old and older can read and write. In particular, 98.1 percent of females in 2015 were literate as compared to 98.4 percent of males (CIA 2016).

Moreover, in 2006, the Bulgarian government enacted policy to reduce or eliminate the segregation of Roma children in the schools (Minority Rights Group International 2016). While the use of minority languages is allowed in the Bulgarian educational system, insufficient government funding has restricted its utilization in the classroom. Additionally, at both the primary and secondary educational level, Turkish, Armenian, Hebrew, Greek, and Romanian languages are offered as elective classes. As a point of information, there is no mention of the Macedonian culture in Bulgarian schools. Further, by law, all public broadcasting must be accessible in languages other than Bulgarian, but, in actuality, Turkish is the sole language used, and, generally, only on an infrequent basis (Minority Rights Group International 2016).

In 2011, Bulgaria utilized 3.8 percent of the gross domestic product (GDP) on educational expenditures (CIA 2016). When the country's educational expenditures were compared to other countries, Bulgaria was ranked 108th out of the 173 countries surveyed. This ranking falls between Saint Lucia (107) and Gambia (109) (CIA 2016) and suggests that roughly 62 percent of the surveyed countries used a higher percentage of the GDP on educational expenditures. Moreover, secondary and tertiary education attendance and achievement have grown in the past 10 years. In 2002, the school life expectancy (primary to tertiary education) was 15 years of attendance for females and 14 years of attendance for males (CIA 2016), which suggests education is equally accessible for both genders from primary through tertiary education. Furthermore, 77.1 percent of Bulgarian women had attained secondary education in 2012. Bulgarian women also had notably higher tertiary educational attainment rates (25.2%) than men (16.1%) (European Commission 2013, 4).

When examining men's and women's selections in fields of study, a contradictory trend has been observed. As a case in point, 73.1 percent of the students in teaching, training, and education science were women, and 67.9 percent of students in humanities and arts were women (European Commission 2013, 9). However, Bulgarian women also have a significant presence in certain stereotypically male-dominated fields. For instance, 45.7

percent of studies in science, math, and computing and 33.1 percent of studies in engineering, manufacturing, and construction were completed by women (European Commission 2013, 9).

Health

In 2013, the World Health Organization (WHO) calculated the under-5 mortality rate in Bulgaria to be 12 deaths for every 1,000 live births. In addition, the probability of dying before 15 years of age in Bulgaria was 5 percent for females and 6 percent for males in 2012 (WHO 2015). Additionally, a 2011 National Survey of Nutritional Status of Schoolchildren in Bulgaria indicated that 30.1 percent of girls aged 10–13 years were overweight, and 10.8 percent were classified as obese. As a means of comparison, 38.3 percent of boys in the same age bracket were overweight, and 17.1 percent were obese (WHO 2016).

In 2013, 7.6 percent of the GDP was utilized by the Bulgarian government for health-related purposes (WHO 2016). The WHO indicated the probability of dying (from all causes) before the age of 70 for females was 33 percent in 2012 (WHO 2015). By contrast, the WHO determined that the probability of dying before 70 years of age was 56 percent for males. For both genders, the likelihood of dying between the ages of 30 and 70 because of non-communicable diseases (cancers, cardiovascular disease, chronic respiratory diseases, and diabetes) was 24 percent. When examining nutrition, physical activity, and obesity in Bulgaria, the WHO reported that 24.3 percent of women were obese as compared to 23.1 percent of men in 2008 (WHO 2013). However, men had a higher prevalence rate of being overweight (63.1%) as compared to women (53.2%).

Access to Health Care

In 2012, there were nearly 4 physicians for every 1,000 Bulgarians, and there were 6.4 hospital beds available for every 1,000 Bulgarians in 2011 (CIA 2016). Moreover, nearly 100 percent of the population received immunization coverage for BCG, DPT1, DPT3, polio3, MCV, Hepb3, and hib3 (UNICEF 2014). The Bulgarian government also financed 100 percent of routine EPI vaccines in 2012. In 2005, the specific needs of oppressed minority groups, particularly Roma and Turks, were identified. A health initiative during that time provided strategies to help improve the health care of marginalized groups.

Maternal Health

In 2015, there were 11 maternal deaths per 100,000 live births (CIA 2016). When Bulgaria's maternal mortality rate was compared globally, Bulgaria was ranked 105th out of the 184 countries surveyed, falling between Denmark (151) and Macedonia (153) (CIA 2016). This rating shows that Bulgaria's maternal mortality rate was lower than 57 percent of the countries examined. In 2008, 99.6 percent of births were attended by a skilled health practitioner. According to WHO, the probability rate of Bulgarian women between the ages of 15 and 49 dying from maternal causes was 0 percent in 2012 (WHO 2015).

Diseases and Disorders

In 2000, the leading cause of death in Bulgaria was ischemic heart disease, which caused 27.8 percent of the deaths during that year (WHO 2015). The top five leading causes of death were ischemic heart disease, stroke (23.8%), hypertensive heart disease (4.8%), chronic obstructive pulmonary disease (4.1%), and trachea, bronchus, and lung cancers (3.4%). Moreover, the prevalence rate of HIV infections in Bulgaria was 3.8 per 100,000 Bulgarians in 2012 (WHO 2015). While Bulgaria has a relatively low HIV prevalence rate in the general population, the Bulgarian government adopted the National Programme for Prevention and Control of HIV and Sexually Transmitted Infections in 2008 (UNAIDS 2014, 3–4). This program's aim is to reduce the likelihood of a national outbreak of HIV/AIDS as well as to develop strategies in improving HIV prevention, testing, treatment, and care. From 2011 through 2013, Bulgaria spent USD\$22,210,825 on HIV/AIDS-related programs and services (UNAIDS 2014, 5). Considering undiagnosed conditions, the WHO estimated that 500 individuals in Bulgaria died as a result of AIDS-related issues in 2011 (WHO 2011). Bulgarian males have a significantly higher rate of contracting HIV/AIDS as compared to females. Specifically, 81 percent of cases diagnosed in 2011 were male (WHO 2011).

In addition, mental health expenditures by the Bulgarian government accounted for 1.4 percent of the entire health budget (WHO 2011). In 2011, there were approximately 137.62 admissions to mental health hospitals per 100,000 population. As of 2011, there were 12 mental health hospitals in Bulgaria. Additionally, there were 5.04 mental health outpatient facilities, 3.43 community residential facilities, and 32.61 beds in mental health treatment facilities for every 100,000 residents. In regard to

health professionals employed in the mental health sector, there are 6.75 psychiatrists, 35.93 medical doctors (not specialized in psychiatry), 431.01 nurses, 0.91 psychologists, and 0.36 social workers per every 100,000 individuals (WHO 2011). In 2011, Bulgaria spent USD\$11,758 on psychotherapeutic medications for 100,000 Bulgarians. Of the money spent on psychiatric medications, USD\$4,260 were used for medications to treat psychotic disorders, USD\$3,480 were utilized for drugs to treat bipolar disorders, USD\$2,128 were used to medically treat mood disorders, and USD\$7 were used for medications to manage general anxiety (per 100,000 individuals) (WHO 2011).

Reproductive Rights and Abortion

Globally, legislation regarding the right to induced abortion has had a notable influence on the reproductive health of women. Conscientious objection (CO) occurs in health care settings when health professionals decline to provide certain services as a function of the professional's religious or moral beliefs (Heino et al. 2013, 231). COs are predominantly enacted when induced abortion services are considered. As a point of information, among the EU member states that have legalized abortion, 21 countries permit medical professionals the legal right to refuse services through invoking COs. Heino et al. (2013) argue that COs have resulted in profound consequences for women's overall reproductive health and rights. Notwithstanding the prevalence of COs throughout the European Union, Bulgarian public health policy does not grant the right to claim CO. Specifically, Bulgaria does not permit health professionals the legal right to refuse the provision of abortion services on the basis of religious or moral beliefs (Heino et al. 2013, 231).

In Bulgaria, abortion, in some capacity, has been legal since 1956. The Ministry of Public Health indicated in 1956 that women had the right to terminate a pregnancy upon request if the pregnancy was of less than twelve weeks' duration. Historically, between the years 1968 and 1990, the Bulgarian government, while legalizing abortion, also placed significant restrictions on the circumstances in which a woman could receive an abortion. By way of example, in 1968, the government denied access to abortion service for childless women, unless a serious medical condition was present (United Nations 2016). Moreover, in 1973, these restrictions were expanded to include women who had one child. Since 1986, Bulgaria has made a concerted effort to liberalize the country's abortion procedures

and laws. In particular, since 1990, Bulgarian abortion laws have acknowledged a women's legal right, throughout the first trimester of pregnancy, to procure an abortion on request without restriction as to the reason or need for the pregnancy termination. As of 1991, abortions were free of charge if provided for women with serious medical conditions and for women under the age of 16 or over the age of 35. Moreover, the contraceptive prevalence rate was 69 percent in 2007 (UN Data 2016). The fertility rate among Bulgarian females in 2012 was 1.5 births per women (World Bank 2015).

Employment

In 2013, the labor force was estimated to consist of 2.535 million individuals (CIA 2016). The labor force is equally diversified by both genders, and, in 2013, the labor force participation rate (ages 15 and over) was 47.9 percent among females and 59 percent among males (UN Data 2016). When the labor force was examined by occupation, 6.7 percent of the labor force worked in agriculture, 30.2 percent in industry, and 63.1 percent in services (CIA 2016). In 2013, there was a 56.3 percent employment rate for Bulgarian women, which is 5 percent lower than the employment rates of their male counterparts. In addition, there is a notable gender pay gap between Bulgarian men and women. While the gender income differential in Bulgaria was reduced by 2.7 percent from 2010 through 2011, there was still a 13 percent gender pay gap in 2013. When examining paid versus unpaid work from 2009 to 2010, females spent roughly 137 minutes per day in paid activities as well as 298 minutes per day in unpaid activities (UNHDR 2015, 7). By comparison, males spent approximately 190 minutes per day in paid activities and 164 minutes per day completing unpaid work.

With respect to unemployment, there was a 10.2 percent total unemployment rate in 2015 (CIA 2016). The unemployment rate increased nearly twofold, from 5.6 percent in 2008 to 10.3 percent in 2011 (Eurofound 2015). In 2012, approximately 21 percent of the country lived below the poverty line, and, in 2013, the female unemployment rate was 10.9 percent. Moreover, when the country's overall unemployment rate was compared internationally, Bulgaria was ranked 115th out of 207 countries, which indicates Bulgaria has a higher rate of unemployment than 55 percent of the surveyed countries (CIA 2016). In 2015, 7.4 percent of the labor force struggled with a long-term unemployment rate, which is higher than the EU mean rate

of 5.1 percent. Additionally, 28.4 percent of youths 15–24 years of age were unemployed in 2013 (CIA 2016), which is a sharp increase from the rate of 11.9 percent in 2008.

When compared to other countries in the European Union, Bulgaria also has the highest poverty rates among elderly women (65 years and older) at 37.2 percent. As a point of comparison, there is a 24.9 percent poverty rate among elderly men. However, unemployment rates for both males and females in Bulgaria have declined significantly since 2002. Furthermore, with regard to marginalized groups, Roma individuals often encounter oppressive treatment in Bulgaria, and their unemployment rate is approximately 65 percent. In 2011, 41 percent of Roma females reported feeling discriminated against because of their ethnicity, and 10 percent of Roma females indicated feeling marginalized due to their gender (World Bank 2015).

Women in the Economy

There are notable differences in vocational choices between Bulgarian females and males. In 2010, the highest percentage of women (21.8%) and men (19.7%) were employed in manufacturing-related careers. Similarly, wholesale retail occupations were the second-highest occupied field for both genders. However, notwithstanding the fact that manufacturing and retail tend to be fields occupied by both genders, there are also clear gender differences in occupational selections. Women are more likely to select a career in industries that are service based. Conversely, men tend to choose jobs in construction, transportation, and public administration fields.

With respect to workplace culture, sexual harassment in the workplace is not an uncommon experience for many Bulgarian women (Todorova, Mechkarska, and Taneva 2013). Employers, judicial authorities, and observers often do not view the problem as significant and, at times, interpret the harassment as a harmless practice. As a point of information, the Vitosha Research and the Bulgarian Gender Studies Foundation indicate that sexual harassment in the workplace has increased because of heightened employment insecurity (Todorova, Mechkarska, and Taneva 2013). Consequently, women in Bulgaria might, at times, encounter hostile work conditions.

Family Life

The political and economic changes exhibited in Central and Eastern Europe during the late 1980s and early 1990s

resulted in subsequent transformations in attitudes toward marriage, cohabitation, and childbearing (Thorton and Philipov 2009, 125). Similar to many other countries, such as Romania, Estonia, and Russia, survey records show that, in Bulgaria, there was a rise in nonmarital cohabitation as well as a decrease in the percentage of cohabitations that resulted in marriage. In 2011, the mother's average age at the time of her first birth increased to 26.3 years (CIA 2016). One theory for this trend is that there was a marked decrease in the influence of religious institutions on laws and enforcement procedures in Central and Eastern Europe, albeit with the notable exception of a few countries, such as Poland. It has been argued that under these conditions there was a corresponding decrease in the typical social standards regarding fertility intentions in countries such as Bulgaria (146). By way of example, in 1990, a survey indicated that 15 percent of Bulgarian respondents believed marriage was an outdated institution. Conversely, in 1999, 30 percent of Bulgarian respondents thought marriage was an outdated institution (Thorton and Philipov 2009, 143).

Scholars have also argued that the fall of the Berlin Wall in 1989 led to greater dissemination of information from the West regarding marriage, cohabitation, and childbearing (Thorton and Philipov 2009, 149). Essentially, the Iron Curtain prevented the flow of information between Western and Eastern Europe. As a result, individuals in Central and Eastern Europe had limited access to and understanding of significant Western economic and familial attitudinal transformations. In the years following the fall of the Berlin Wall, women in Bulgaria developed a greater awareness of the familial trends in the West.

Marriage and LGBT Rights

There is a paucity of domestic-based research on lesbian, gay, bisexual, and transgender (LGBT) rights in Bulgaria, and the majority of the data about LGBT issues is provided by international sources. Since 2014, Bulgaria has banned discrimination because of sexual orientation in employment, social security, health care, and educational settings. The Bulgarian Constitution protects the freedom of expression and assembly. As a result, there have been myriad public events initiated by LGBT organizations as well as LGBT pride marches in 2008 and 2009. However, violence and attacks perpetrated against LGBT persons is still a widespread and pervasive issue throughout the country. In fact, while Bulgaria bans discrimination against LGB

individuals, the national Criminal Code fails to explicitly criminalize homophobic-based crimes. In addition, the Bulgarian legal system does not recognize same-sex marriages or same-sex partnerships. Consequently, Bulgaria does not provide legal acknowledgement for the relation between children and same-sex co-parents, which has resulted in a number of significant challenges for LGBT families.

The Act against Discrimination is an equality law that prohibits discrimination based on any of the conditions noted under international or domestic legislation. In particular, the act incorporates a legal definition of sexual orientation that includes heterosexual, bisexual, and homosexual orientations. Conversely, transsexuality is viewed as a medical condition in Bulgaria. Specifically, transsexuality is often treated as a libido dysfunction. By virtue of the fact that the Bulgarian legislation does not distinguish "sex" from "gender," transsexual and transgender individuals do not receive protection from bias due to gender, gender identity, or gender expression.

In terms of the health-care system, LGBT patients encounter discrimination and stigma when attempting to utilize health care. For example, there is a legal ban on blood donations from homosexuals as well as from men who have had sex with another man. Furthermore, only different-sex couples with documented fertilization issues are legally permitted to utilize assisted reproductive technology. Moreover, while gender reassignment surgery is permitted, the costs associated with surgical intervention and transitioning are not provided by the Bulgarian government.

Familial Economy

Both parents are afforded the opportunity to take a maternal or paternal leave from their work to stay at home to take care of newborn children. In total, parents have the option to take a leave for up to 410 calendar days (World Bank 2015). Moreover, either parent has the option of utilizing parental leave until the child is two years old. During this time, the parent receives the average minimum wage. In 2013, the average length of maternal leave was 32 weeks. Due to the comprehensive parental leave guidelines in Bulgaria, part-time arrangements are often unnecessary to meet both job and family requirements when children are young. In addition, the rate of formal child care usage in Bulgaria is approximately 15 percent lower than the EU average. In 2013, only 7 percent of Bulgarian children under age 3 received formal child care of 30 hours or more

a week. Approximately 54 percent of Bulgarian children between the ages of 3 and school age were enrolled in child care.

Politics

In 1991, 28 of the 200 elected Bulgarian Parliament members were women. In the 2005 election, though, 21 percent of the elected Parliament members were women. It should be noted that the number of female members of Parliament elected in 2005 were, in actuality, relatively high as compared to other European nations at those times (Ibroscheva and Raicheva-Stover 2009, 112). However, Ibroscheva and Raicheva-Stover (2009) expressed that the percentage of women elected was troubling by virtue of the fact that there was a marked increase in the percentage of women running for office without an equivalent increase in the number of women elected. As a case in point, the number of women running on the election ballot from 2001 to 2005 more than doubled. In fact, there were 713 female parliamentary candidates in 2005, an increase of 65 percent. By 2013–2014, female representation in the political arena in Bulgaria was commensurate with other EU countries, with approximately 23 percent of elected parliamentarians being women. Based on these figures, the number of women elected to Parliament has increased in the two decades.

Female Politicians in the Media

With respect to women in politics, some scholars have argued that the language and tone toward women exhibited in the Bulgarian media are inextricably connected to the same gender biases that have been displayed in the global media. Studies have highlighted a global trend of utilizing value-based terms such as “conciliatory,” “compassionate,” and “sensitive” when describing female politicians, while male politicians are often depicted using terms such as “ambitious” and “confrontational.” Bulgaria is similarly influenced by the global “misogynist ideology of the newsroom” (Ibroscheva and Raicheva-Stover 2009, 113 and 115). Research studies regarding media coverage of female politicians suggest that the popular press promotes pervasive social stereotypes, and in terms of female politicians, the popular press often concentrates on appearances rather than substantive issues.

In terms of Bulgarian media, the portrayal of female politicians in the press has shifted in alignment with

the social, political, and cultural transformations that occurred after the fall of the Berlin Wall. Ibroscheva and Raicheva-Stover (2009) conducted a textual analysis of *Trud*, the highest-circulation daily paper in Bulgaria, to examine the way in which female politicians were depicted in the 2005 parliamentary elections. While the articles briefly highlighted the educational and professional qualifications of various female candidates, these details were typically discussed within the framework of values and attitudes toward femininity (Ibroscheva and Raicheva-Stover 2009, 123). In illustration of this point, when examining the photographs of female politicians in *Trud*, the study found that the women received less photographic coverage when compared to their male counterparts. Furthermore, only 4 of the 110 photographs of female politicians made the front page of *Trud*. In general, female politicians who more closely matched traditional beauty standards were pictured in stereotypic women’s activities, such as riding bicycles with four year olds, dancing, making pottery, or playing the violin.

Findings from the study ultimately suggest that the press coverage of female politicians was filtered through the framework of sexual innuendo, gender stereotypes, and the postcommunist masculinization of democracy. In a similar vein, the findings support the notion that politics are typically viewed as a male-oriented field where female politicians are rare. Ibroscheva and Raicheva-Stover argue that these types of media depictions might promote a socio-cultural climate of tolerance toward sexism, particularly in the political arena.

In addition, Todorova stated that the political language exhibited in Bulgaria has historically been male gender-specific, particularly during periods of political discourse (Todorova 1994). By way of example, she noted that political headlines that are promulgated in the media often include assertions such as “What we need is professional political men” or “The country is in need of honest men” (Todorova 1994, 138). Furthermore, within the male-dominated political arena, it has been argued that women’s issues are, at times, dismissed or downplayed. This trend, for instance, has been apparent in addressing women’s issues in the workplace.

Legislation

The Bulgarian Ministry of Labour and Social Policy initiated a campaign to raise the number of women on company boards in 2011. The ministry also urged companies

to incorporate the European Commission's pledge for self-regulatory measures for gender equality in corporate decision making. When compared to other participating countries, Bulgaria contributed the highest number of signatory companies for the pledge. However, notwithstanding Bulgaria's attempts to address the lack of female representation on the boards, Bulgaria has struggled in meeting international commitments for gender equality and women's rights, and the Bulgarian government has opposed EU legislation on the issue. The Bulgarian government withdrew funding for the National Action Plan on Gender Equality in 2012. During that same year, the government lowered the standing of the National Mechanism for Women's Rights and Gender Equality between Women and Men from a consultative to a declarative group.

Ibroscheva and Raicheva-Stover (2009) argue that democratization did not, in many ways, result in a social system of equalities or any notable qualitative improvements with respect to gender equity. In particular, prior to the fall of the Berlin Wall, women's equality was arguably marked with full employment, social benefits, and quota representations in the Communist Party. By contrast, the rise of democracy led to postcommunist trends of marginalization. Sociocultural pressures also emerged for women, including decreased access to the labor market, loss of family social benefits, and the revival of traditional norms (Ibroscheva and Raicheva-Stover 2009, 112). According to Ibroscheva and Raicheva-Stover, changing social values also led to an increase in oversexualized depictions of women in the media as well as a heightened vulnerability to such gender crimes as human trafficking and forced prostitution. Ibroscheva and Raicheva note that some of these trends are, to some invariable extent, exacerbated by the postcommunist pattern of women's decreased involvement in political discourse.

While Bulgaria continues to have areas of gender inequality, the country has enacted important legislation regarding minority rights since the end of communist domination in the 1990s. In illustration of this point, the Bulgarian government developed and implemented a consultative group on minority issues, the National Council on Ethnic and Demographic Questions. It should be noted that while many minority groups were represented in this consultative body, Macedonians were notably absent. In addition, antidiscrimination legislation was adopted in 2003, which permits civil society organizations to file lawsuits that are in the public interest. In a similar vein, prior to joining the European Union in 2006, the Bulgarian

government had made a concerted effort to improve Roma rights (Minority Rights Group International 2016). In 2003, the government agreed to participate in the Decade of Roma Inclusion, a program designed to address various areas of racial and gender discrimination, including employment, health care, and housing. This program was sponsored by the World Bank, the Open Society Institute, and the Hungarian government and was ultimately enacted in 2005.

Religious and Cultural Roles

While Eastern Orthodox Christianity is referred to as the traditional religion of the country, religious freedom was affirmed in the 1991 Bulgarian Constitution (Minority Rights Group International 2016). Furthermore, current information indicates that, among Bulgarians, 59.4 percent are Eastern Orthodox; 7.8 are Muslim; 1.7 percent are Catholic, Protestant, or Jewish; and 31.1 percent are not affiliated with a specific religion (CIA 2016). In 1958, a new Statutes of the Bulgarian Party was established, which mandated that party members fight "resolutely against religious prejudices." There is evidence that many Bulgarians, particularly Communist Party members, were afraid of the potential negative consequences of stating one's religion and spirituality on their social status. At that time, a range of atheistic propaganda was circulating in which religion was portrayed as a symbol of backwardness and lack of education. Sociological surveys in the 1970s and 1980s demonstrated that between 36 percent and 51 percent of religious individuals felt guilty about their religiousness and, consequently, tried to conceal their beliefs.

Issues

Violence against Women

In 2012, the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) expressed concern regarding the high prevalence rate of domestic violence as well as the acceptance of sociocultural attitudes permitting such violence in Bulgaria. A study initiated by the Gender Project found that physical or sexual intimate partner violence is exhibited across a diverse range of educational and environmental conditions (Todorova, Mechkarska, and Taneva 2013). Similar to the study conducted by the Gender Project, Todorova, Mechkarska, and Taneva (2013) found that violence against women is not relegated to a specific socioeconomic group. The most

common form of violence reported, roughly 75 percent of the sample, was physical violence, which included coercion, suppression, and imposing control on the actions of another (Todorova, Mechkarska, and Taneva 2013, 254). In addition, the reported stressors for violence against women in the family were wide ranging and included, but were not limited to, economic problems, unemployment, poor living conditions, and the abuser's overall personality. The findings from this study ultimately challenged the widespread societal belief that only certain social-demographic groups are vulnerable to sexual violence. Todorova, Mechkarska, and Taneva argued that the pervasive cultural belief that a limited number of women experience domestic violence may cause Bulgarians to underestimate the prevalence of violence against women, and, consequently, inadequately respond to this serious social issue.

Human Trafficking

In the European Union, Bulgaria is frequently cited as one of the predominant source countries of human trafficking. In particular, Bulgaria is often considered a source, transit, and destination country for forced labor and sex trafficking (U.S. Department of State 2015). The sexual victimization of Bulgarian women and children primarily transpires in resort areas and border towns (La Strada International 2016). Typically, labor exploitation arises in the agricultural, construction, and restaurant sectors, as well as by forcing children to beg (U.S. Department of State 2015). A significant portion of the reported victims in Bulgaria are ethnic Roma men, women, and children. This population is particularly vulnerable because of cultural socioeconomic marginalization (La Strada International 2016). There is also an increasingly alarming trend of pregnant women trafficked to sell their babies in other countries, particularly in Greece. In addition, Bulgarian men, women, and children have historically been forced into unwanted labor in Belgium, Cyprus, the Czech Republic, Germany, Greece, Israel, Italy, Lithuania, the Netherlands, Norway, Spain, Sweden, and Zambia (U.S. Department of State 2015). Moreover, Bulgarian women and children are victims of sex trafficking not only within the country but also in Europe, the Middle East, Russia, and the United States. Between 2005 and 2007, approximately 600 Bulgarian victims were reported in 17 countries.

In 2009, Bulgaria implemented more specific legislation on human trafficking and, as a direct result, more convictions for this crime have occurred. According to the

Supreme Cassation Prosecutor Office in Bulgaria, in 2005, the country convicted three individuals on human trafficking charges. By contrast, 85 individuals were convicted of human trafficking in 2007. The government of Bulgaria also enacted an annual National Action Plan for Suppressing Human Trafficking and Prostitution in 2013 (La Strada International 2016). Notwithstanding these notable improvements, human trafficking and forced prostitution continue to be significant cultural issues in Bulgaria. According to La Strada International, many convicted offenders of human trafficking were not imprisoned by the Bulgarian court system. Similarly, there are relatively low rates of convictions made against suspected traffickers, particularly government officials who are believed to have committed traffic-related crimes. Corruption in the government fosters a climate that ultimately permits the continuation of trafficking crimes.

The U.S. Department of State's Trafficking Victims Protection Act (TVPA) offers strategies and tools to reduce trafficking crimes domestically as well as in the international community. In 2015, Bulgaria was downgraded from Tier 2 to Tier 2 Watch List by the U.S. Department of State. Bulgaria was placed on the Tier 2 Watch List countries because the Bulgarian government was not fully complying with minimum guidelines established to prevent trafficking that were established by the TVPA. In particular, although the Bulgarian government was making notable efforts to become compliant with the standards, it was determined that Bulgaria continues to have a significant number of victims impacted by serious forms of human trafficking. In addition, the U.S. Department of State determined that the Bulgarian government failed to demonstrate increased measures to combat human trafficking.

According to the TVPA report, there was a notable decrease in 2014 in the prosecution and conviction of traffickers as well as a significant decline in the overall resources being allocated to victim protection. In particular, the funding for nongovernmental organization (NGO) shelters for women victims, for instance, was significantly reduced and ultimately resulted in the shelters being closed in September 2014. Prior to the shelters' closure, these organizations provided medical and psychiatric services as well as help in reentering the Bulgarian community for victims of trafficking. TVPA reported that Bulgaria's ability to offer shelter and services for victims was not commensurate with the percentage of victims who had been identified.

Refugees

The Syrian refugee crisis has become a transnational issue and has resulted in rising numbers of individuals pursuing asylum in Bulgaria (CIA 2016). Greece, Italy, and Bulgaria have received criticism regarding their responsiveness to the Syrian refugee crisis (Refugee Studies Centre 2014, 41). However, these countries have argued that they shoulder an unreasonable share of the crisis because of their location as primary entrance routes into Europe. From Syria, the entrance routes into Europe by land are through Turkey and then to Greece and Bulgaria (Refugee Studies Centre 2014, 35). As a point of information, Bulgaria, Sweden, Germany, the Netherlands, and Switzerland comprise approximately 70 percent of Syrian asylum applications in the European Union. In fact, the rate of asylum seekers has grown significantly in Bulgaria. By way of example, the country received 6,980 asylum applications from Syrians in 2013, a significant increase given that Bulgaria received 1,230 applications in 2012 (Refugee Studies Centre 2014, 37). Syrian refugees are typically given subsidiary or humanitarian protection instead of refugee status.

When compared to countries with more developed refugee and immigration procedures, such as the United Kingdom and Sweden, Bulgaria is still in the early stages of creating asylum and international protection legislation (Refugee Studies Centre 2014, 34). It has been reported that the conditions of reception facilities in Bulgaria, Cyprus, and Greece are relatively poor. Specifically, there have been reports of overcrowded conditions and a lack of education for children as well as inadequate food, shelter, and medical care in these facilities. While the overall conditions of the reception facilities have been improving since 2013, Bulgaria does not have an effective system for guardianship for unaccompanied minors, for children's access to formal education, and services for psycho-social support for children. The country's heightened levels of economic instability might influence Bulgaria's ability to respond to the Syrian refugee crisis (Refugee Studies Centre 2014, 34).

C

Croatia

Overview of Country

The Republic of Croatia (Republika Hrvatska) is located in southeastern Europe on the Adriatic Sea and shares borders with Bosnia and Herzegovina, Montenegro, Hungary, Slovenia, and Serbia. The mid-2014 population was 4.2 million (PRB 2014). Croatia's population has been in decline since the 1990s.

Croatia is a constitutional parliamentary democracy, with a five-year presidential election cycle and a unicameral legislature, which operates on a four-year election cycle. Croatia has been a member of NATO since 2009 and a member of the European Union since July 2013. The legal voting age is 18, and women were enfranchised in 1945.

At the beginning of the 20th century, the Croatian territory was a part of the Austro-Hungarian Empire. At the end of World War I, the Croatian territory, the Slovenian and Bosnian territories, and the Serbian Kingdom were united as the Kingdom of Yugoslavia. During World War II, Croatia functioned as a Nazi-allied puppet state. It is estimated that in the Croatian concentration camps, which were controlled by the nationalist Ustasha Party, 600,000 Serbs, 30,500 Jews, and 20,000 Roma were murdered (Hirsch 1999, 634). Croatia rejoined socialist Yugoslavia at the war's end.

In 1991, Croatia declared independence from the Socialist Federal Republic of Yugoslavia, which existed from 1946

to 1992 and was composed of six multiethnic socialist republics (Serbia, Croatia, Macedonia, Montenegro, Bosnia and Herzegovina, and Slovenia). The political events surrounding the independence movement in Croatia led to the Balkan Wars of the 1990s and the dissolution of Yugoslavia. During the Croatian War (1991–1995), sexual violence was rampant, around 200,000 people were displaced, and 10,000–15,000 people were killed (Mojzes 2011, 162). This violence was due to ethnonationalist sentiment and fear, largely between ethnic Serbs and ethnic Croats.

Ethnically, the population is 90 percent Croat, and the culturally and numerically dominant religion is Roman Catholic. Serbs are the next largest ethnic group at nearly 4.4 percent of the total population, and the remainder of the population includes Bosniak, Hungarian, Italian, Czech, Slovene, Muslim, and Roma peoples (CBS 2014a, 7). The percentage of ethnic Serbs decreased substantially, from 12 percent of the total population to the current 5 percent, during the 1991–1995 war in Croatia, when many Serbs died or were displaced (Hirsch 1999, 636).

Ethnonationalist conflicts have strongly shaped the Balkan region, and the rights of ethnic or “national” groups are now legally protected in antidiscrimination legislation. The official language is Croat, which uses a Latin alphabet and is highly similar in spoken form to Serbo-Croatian, which uses Cyrillic in written form. There is no state religion, but the Roman Catholic Church has wide influence on public policy, both formally and informally.

The current average age of women within the total population is 43, with a life expectancy at birth of just under 80. The literacy rate for women in 2011 was 98.7 percent (82.8% in 1961) and lags behind men's 2011 literacy rate by 0.9 percent (CBS 2014a, 7). The infant mortality ratio has been in steady decline since 1950; in 2013, it was 3.6 deaths per 1,000 live births (PRB 2014). The maternal mortality ratio is on the decline; in 2013, it was 13 deaths per 100,000 live births (World Bank 2014).

The World Economic Forum's (WEF) *Global Gender Gap Report* measures gaps in women's access to opportunities annually as compared to men's in four areas (education, politics, economics, and health) in all countries for which standard data is available. In the 2014 report, Croatia's overall rank is 55th out of the 142 countries measured, having fallen in the rankings since 2011. Within the 4 areas in which data is collected, Croatia is ranked 65th for both economic participation and opportunity and educational attainment, 37th for health and survival, and 56th for political empowerment (WEF 2014, 158).

Girls and Teens

Educational Attainment

Public education is overseen by the Ministry of Science, Education, and Sports. Preschool is attended by 43 percent of children (6 months to 6 years), which is well below the European norm of 90 percent (Herrity 2013, 512). Elementary education is compulsory and free for students aged 7–15, and in 2013, girls were 48.8 percent of the total number of graduates (CBS 2014a, 29).

Secondary education begins at age 14 or 15, and although it is not compulsory, there is growing recognition of the necessity of secondary education for employment and a movement toward establishing mandatory attendance. Secondary education is largely government subsidized. Students choose between three broad areas of study: an academic track for university preparation (gymnasium); vocational, technical, or professional tracks for employment preparation; and arts-related programs. In 2012, women were just over half of all graduates of secondary education (CBS 2014a, 29).

Women attend and graduate from university in greater numbers than men, making up 56.5 percent of the enrollment in 2012 and 59.5 percent of the graduates (CBS 2014b, 28). University attendance and graduation rates for women have increased steadily over time in comparison with men, and in 2011, 16.7 percent of women in the total

population held university degrees, compared to 16 percent of men (CBS 2014b, 24). However, educational attainment does not work to women's advantage in employment rewards as shown by the counterfactual wage gap of just over 20 percent (see "Employment" section).

Curriculum: Sex Education and Textbooks

Religious education was institutionalized in 1997 via the Agreement on Cooperation in the Field of Education and Culture, which stated that cultural religious traditions and religious-based ethics should have a presence in public education (Kuhar 2014, 3). The pro-life, antigay, and patriarchal heteronormative beliefs about sexuality of the Catholic Church continue to influence the sex education curriculum and textbooks.

In the sex education curriculum, the topics of masturbation, homosexuality, and contraception have been treated in overtly biased ways and framed as deviant, unnatural, and sinful (Kuhar 2014, 5). In 2008, sex education was removed from public schools when a government study showed it was having no effect on students, but it was reintroduced in 2012 with the inclusion of the sex/gender equality and responsible sexual behavior module, which includes a scientific perspective and information on gender, sexual diversity, and discrimination against sexual minorities (Kuhar 2014, 6). Presently, the health education curriculum debate continues. Conservative politicians and representatives of the Catholic Church have expressed concerns that the curriculum, which begins in third grade, is nonheteronormative, and they are concerned that modules focusing on gender, sexual inequalities, and abuse will undermine traditional beliefs held by the religious and promote sexually promiscuous behavior of teens (Kartus 2013, 8).

The content of school textbooks has been the subject of research and legislation. In the 1990s through the first decade of the 21st century, textbook content strongly reflected the ethnonationalist and pronatalist discourse, which characterized women's importance solely in terms of reproductive capacity. Gender stereotypes were the norm, and images of men were overrepresented (Bijelić 2007, 283). The Primary and Secondary Education Act (updated in 2012) includes an emphasis on avoiding discrimination and reducing inequality and prejudice. The Textbook Standard of 2007 explicitly requires gender-sensitive language, the removal of stereotypes, the balancing of male and female images, and the inclusion of interdisciplinary topics in elementary and secondary educational contexts

addressing the protection and promotion of gender equality (Štimac Radin 2011, 28).

Health and Sexuality

Globalization and postindustrial modernization have been shown to be linked to a rise in the idealization of a thin body for women, and girls and young women appear to have internalized this ideal, with body dissatisfaction and disordered eating among young women being common (Pokrajac-Bulian and Ambrosi-Randić 2007, e86; Zaboriskis et al. 2007, 233).

There appears to be a gap in adolescents utilizing sexual health services. Half of sexually active adolescent girls have not been seen by gynecologists, and very few secondary school students consult school-based sexual health counseling centers (UNICEF Office Croatia 2011, 20). Girls and boys experience childhood sexual abuse at close to the same rates, though girls experience noncontact sexual abuse (being forced to look at sexualized media content or being spoken to in a sexual way, for example) at higher rates than boys, and this effect increases with age (Ajduković, Sušac, and Rajter 2013, 474).

A recent study found that sexually active urban girls aged 15–19 are at high risk for sexually transmitted infections (STIs) (Hirsl-Hećej et al. 2006). The average age of sexual debut (about 17) has remained steady for women and men since the 1980s and is comparable to other European countries, while rates of regular condom use are low (Landripet, Štulhofer, and Baćak 2011, 462, 465). High levels of reported religiosity have been shown to be weakly connected with decreasing sexual risk-taking for girls, though not for boys, and upon this evidence, the authors of these studies suggest that an abstinence-based sex education curriculum, as favored by the Catholic Church, is not effective for reducing sexual risk-taking.

Employment

In 2012, the total number of employed people was 1.44 million, 45.5 percent of whom were women. The 2012 total unemployment rate was 15.8 percent, with women experiencing a slightly lower unemployment rate of 15.5 percent compared to men at 16.1 percent (CBS 2014b, 33).

Employment Protections

During the socialist period, state-mandated policies that benefited women's employment included the right to

work, equal treatment and equal pay, protected maternity leave, and state-run child care centers for young children (Dobrotić, Matković, and Zrinščak 2013, 220).

The network of child care centers was not strong, and women with preschool-aged children tended to rely on older female family for help with child care responsibilities (Špehar 2007, 161). This pattern continues and somewhat accounts for a low enrollment in nursery school and preschool compared to other European nations, which in turn affects the number of women with very young children participating in paid employment outside the home.

The Maternity and Parental Benefits Act covers maternity and parental leave; it stipulates that compulsory maternity leave begins 28 days before the expected due date and continues 70 days after birth. Beyond this period, noncompulsory maternity leave continues until the child is six months old, and additional and more flexible parental leave (for either parent) is available for set periods until children are eight years old. Compensation during parental leave amounts to 100 percent of wages (EU, European Platform for Investing in Children 2014). In 2010, only 1.86 percent of men utilized parental leave (Štimac Radin 2011, 24). Women continue to be the primary caregivers of children, regardless of their participation in paid employment outside of the home.

Employment discrimination based on family or pregnancy status is illegal, so employers may no longer ask questions about or act on known information related to family or pregnancy status, specify gender or family status in advertisements for employment, or discriminate in any way against employees based on pregnancy or family status (Massetot, Caracciolo Di Torella, and Burri 2012, 55). However, discrimination based on these attributes is widespread, and there is a low level of awareness among women about their rights, which contributes to likely underreporting of employer discrimination (Ombudsperson for Gender Equality 2013, 19).

Sexual harassment was experienced by at least 18 percent of employed women in 2006, and it is likely underreported due to fear of retaliation and lack of awareness (Ombudsperson for Gender Equality 2013, 18; Cvitanic 2011, 70). Case law is not published at the municipal and county levels, so there is little researchable documentation to assess the number and type of discrimination complaints (Ombudsperson for Gender Equality 2013, 21).

Gender Role Attitudes

According to the 2008 European Values Study (2008), 82 percent of Croatian respondents disagreed with the

statement, “When jobs are scarce, men should have more rights to a job than women.” Croatia participated in the 1996 World Values Survey in which this same question was posed, at which time 47 percent of male respondents and 38 percent of female respondents agreed with the statement, showing a slight shift to more egalitarian attitudes over the last decade regarding women’s participation in the paid labor force (Bijelić 2007, 279). The 2003 East European Social Survey Project showed that respondents’ beliefs and attitudes about women’s roles in the paid employment sector are overall more woman-friendly than beliefs and attitudes about the division of household labor between men and women (Brajdić-Vuković, Birkelund, and Štufhofer 2007, 33). This results in a “second shift” for women who work in paid employment and handle most of the household labor.

Wage Gap, Employment Sectors, and Education

Women’s salaries were 90.2 percent of men’s in 2012, independent of economic sector and employment characteristics, creating an unadjusted wage gap of about 10 percent (CBS 2014b, 37). In recent years, Croatia has had one of the lowest unadjusted wage gaps in Europe (Nestić 2010, 85). Based on Labor Force Survey data from 1998 and 2008, the counterfactual wage gap, which takes into account employment characteristics such as educational attainment and employment context or field and then compares men’s and women’s salaries when their employment characteristics are similar, exceeds 20 percent. In other words, Croatian women tend to receive 20 percent lower salaries than men, even when they possess similar or stronger employment characteristics (Nestić 2010, 83).

More women than men work in the areas of health and social services, arts and entertainment, education, finance and insurance, and hospitality and service (CBS 2014b, 36). Since 1990, women are more likely than men to be medical doctors, and in 2012, 61 percent of all medical doctors were women (CBS 2014b, 19). Overall, women are more likely than men to be employed in the public sector (education, public administration, and health), making up 68 percent of public-sector workers in 2010, and they are more likely to work part-time (Dobrotić, Matković, and Zrinščak 2013, 228, 230).

Women are more likely than men to complete graduate school, and in 2012, they made up 58.2 percent of those who earned master’s degrees and 54.6 percent of those who earned PhDs (CBS 2014b, 31–32). For higher

education as a whole, women outnumber men in all fields of study except for computing, engineering, architecture, personal services, transport services, environmental protection, and security services (CBS 2014b, 29–30).

Family Life

Attitudes about Children and Family Composition

The 2014 estimated birth rate is 9.49 births per 1,000 people, placing Croatia in the 201st position out of 224 countries for which there is data (CIA 2014). Data from the 1995–1999 World Values Survey indicates that 49.2 percent of Croatian respondents believed that women need children to be fulfilled, while more recently, the 2008 European Values Study (EVS) data indicates that 46.9 percent of respondents felt that women need children to be fulfilled, showing only a slight decline (WVS n.d.; EVS 2008).

The 2008 EVS also shows that most respondents (80.9%) believed that marriage is not an “outdated institution,” which shows only a slight decrease from 87.3 percent on the 1999 EVS. Likewise, most people reported that family is “very important” in their lives (78.4% in 1999, 77% in 2008), and sociodemographic characteristics were not a statistically significant factor in how this question was answered (EVS 2008; Nikodem 2012, 187). On the 2008 EVS, 23 percent of respondents believed that it is a duty to society to have children. This question was not included on the 1999 EVS, so no comparisons over time are possible (EVS 2008).

Attitudes about nontraditional family compositions and formal marriage were also measured in the 2008 EVS. Of respondents, 54.6 percent indicated that it is “alright for two people to live together without getting married”; nearly 80 percent maintain that “a child needs a home with both a father and a mother to grow up happily”; and only 6.7 percent feel that “homosexual couples should be able to adopt children” (Nikodem 2012, 187).

In 2012, 15 percent of live births were “extramarital” (CBS 2013, 129.) The 2008 EVS indicates that 66.2 percent approve of a situation in which a woman chooses to have children outside of a relationship with a man, and this response was affected by sociodemographic characteristics. Middle-aged women from the western regions were more likely to approve than older women with less education, lower incomes, and from rural areas (Nikodem 2012, 187). While reported religiosity overall is quite high, traditional beliefs about some aspects of marriage, family structure, and children may be on the decline (Nikodem 2012, 192).

Reproductive Labor and Child Care

The number of women identifying as “housewives” has been on the decline, from around 18 percent of women aged 25–49 in 1996 to 11 percent in 2011 (Dobrotić, Matković, and Zrinščak 2013, 227). However, traditional gender roles and norms related to reproductive work (housework, childcare, and kinwork) are firmly in place. While urban women participate in the paid labor force outside the home in nearly equal numbers with men overall, men do not participate in equal rates with women in reproductive work, and these patterns are shaped by attitudes about appropriate gender roles.

In rural locations, traditional gender norms and attitudes strongly affect the division of labor, and households tend to be extended and virilocal. It is not common for men to take part in so-called women’s work, which is devalued, and women are not typically economically independent. It is also widely accepted that being a good mother is not compatible with paid labor (Šikić-Mićanović 2011, 94–95).

Women are expected to bring household goods into marriages, and inherited items, rather than new store-bought items, can be markers of status. For example, the *stolnjak*—a handwoven tablecloth used on formal occasions that has ideally been passed down from older female relatives—is carefully protected for future generations (Sredl 2008, 426).

Marriage and Divorce

The average age at first marriage of both women and men has been increasing from the mid-20th century to the present. In 2012, the average age of women at first marriage was 27, and the average age of men at first marriage was 30. Likewise, the average age of women at first birth has been steadily increasing, and in 2012, it was 28 (CBS 2014b, 15). Due to economic conditions, young women and men are likely to live at home through their twenties, with a median age of 32 for males leaving the parental home and a median age of 28 for women (Cvitanic 2011, 67). The increasing age at first marriage and age at first child is likely due to economic conditions that may make it difficult for young adults to establish economic independence without a university degree or successful employment (Rešetar and Berdica 2013, 572).

Marriage rates have been in decline overall. In 1950, there were 37,995 marriages, and in 2012, there were 20,323. Divorce rates have not changed since the 1970s, with a total of 5,659 divorces in 2012 (CBS 2014b, 14). In

the 1960s and 1970s, the divorce rate in socialist Croatia as compared to most other European countries was high, though, currently, the 20 percent divorce rate is one of the lowest and may be attributed to the high levels of religiosity, specifically Roman Catholic (Rešetar and Berdica 2013, 568–569).

In 1946, the Basic Marriage Act positioned divorce within the state realm rather than the religious. This enabled married people to seek legal divorce for the first time (Rešetar and Berdica 2013, 569). Under this law, court-based mediation was a mandatory precondition for divorce. Court mediation prior to a legal granting of divorce is no longer required unless the marriage includes children under parental care, in which case a reconciliation procedure is required (Rešetar and Berdica 2013, 570).

During the socialist period, the custody of children in the case of divorce was typically granted to mothers over fathers, though this was not required by law. Currently, parents assume automatic joint parental responsibility, and in the case of divorce, the court grants residential custody of children to one or the other based on what it deems to be in the best interest of the child (Rešetar and Berdica 2013, 571).

The 2003 Gender Equality Act prohibited discrimination against LGBT people, and the Same Sex Civil Unions Act of 2002 created a legal context for formal same-sex unions, though the rights given to same-sex partners within these unions were not of the same scope as those given to different sex partners in marriage (Juras and Grđan 2010, 81). In 2013, a constitutional referendum to limit marriage to different-sex couples passed by popular vote. However, in 2014, the Croatian parliament passed the Life Partnership Act, which grants same-sex couples the same set of rights as those in registered different-sex marriages, barring adoption rights.

Politics

Public Policy

Croatia has been a member of the European Union since July 2013, and the accession processes since 2004 have had a marked effect on the official practices related to the promotion of gender equality (Dobrotić, Matković, and Zrinščak 2013, 219). The international legal obligations of EU member states include the protection of human rights, the discouragement of discrimination, and the expansion of equal opportunities.

The current constitution dates from 1990, when democratic elections were held and Croatia broke away from socialist Yugoslavia. Article 3 of the Constitution (as amended in 2000) sets forth the highest values of the country, which explicitly include gender equality and social justice.

Croatia's first step as an independent nation to address gender equality via governmental policy was the creation in 1996 of a government advisory body called the Committee for Equality Affairs, which in 2000 became known as the Committee for Gender Equality. This body did not at first consult with feminist organizations or women's NGOs and is viewed largely as a symbolic effort with little commitment to promoting real change (Dobrotić, Matković, and Zrinščak 2013, 224).

Other governmental bodies charged with the promotion of gender equality include the Parliamentary Committee for Gender Equality, established in 2001 to implement international policy agreements and monitor gender representation in Parliament, and the Gender Equality Ombudsperson Office, established in 2003 with a charge to protect the rights of citizens in legal and state proceedings. In 2004, the Office for Gender Equality was established in accordance with the 2003 Gender Equality Law, and it works in tandem with the Parliamentary Committee for Gender Equality. This office was made responsible for drafting and overseeing implementation of the National Policy for Gender Equality, one of several formal government policies that directly address and promote gender equality and prohibit discrimination. Other important policies and acts directly addressing gender-based discrimination include the 2008 Gender Equality Act, the 2008 Anti-Discrimination Act, and the 2009 Act on the Protection against Domestic Violence.

The National Policy for the Promotion of Gender Equality was adopted in 1997, and its goals at that time conformed to the Beijing Platform for Action. It was updated in 2001, in 2006, and most recently in 2011. Its current goals include promoting the human rights of women, education, equal opportunity in employment, and decreasing violence against women. The 2011 policy specifically addresses the need of Croatia as a candidate country for EU membership to conform to the EU guidelines on human rights. Croatia joined the European Union in 2013.

The Gender Equality Act of 2008, which first entered into law in 2003, prohibits discrimination in a number of areas, including the labor market, education, media, and political representation. Article 15 specifies that political

parties must implement measures to create a balance of the number of women and men on their candidate party lists. It also prohibits discrimination based on family status and sexual orientation.

Women in Office

Women have held high office in limited numbers, including that of prime minister. The first woman to serve as prime minister was Jadranka Kosor (1953–) of the conservative HDZ political party. From her position of deputy prime minister, she succeeded Ivo Sanader (1953–) when he resigned in 2009. Women constitute a majority of judicial officials, and of the current justices of the Supreme Court, nearly half are women (Palikovic Gruden and Gruden 2013, 12). Women have poorer representation in local and smaller regional bodies, making up 18.4 percent of municipal council members, 20 percent of county assembly members, 5 percent of county prefects, and 8.7 percent of mayors (CBS 2014b, 67).

Women's numerical representation in political decision making within the legislative branch dropped drastically after independence and only reached preindependence levels of participation in the 2000 elections. During the socialist period, quotas guaranteed that women participated in formal decision-making processes and held office in the legislature, the executive branch, and within the Communist Party. Quotas were reintroduced by the 2008 Gender Equality Act, and political party electoral lists must now consist of at least 40 percent of the "underrepresented gender" (Štimac Radin 2011, 25).

An ideological backlash during the independence movement combined with a transition to a free-market economy and the economic and social problems stemming from war maneuvered women from the public to the private realm. Ethnonationalist and sexist attitudes about women's participation in public life strongly reflected notions of traditional and "ideal" gender roles: women as nurturers and mothers and men as political actors and breadwinners.

During the 1990s, women held between 4 percent and 8 percent of the total legislative seats available, and in the 2000 elections, this jumped to 20 percent and remained in that vicinity throughout the decade (IPU n.d.). As of October 2014, of 151 members of the legislature, 39 (26%) are women (Croatian Parliament n.d.). This exceeds the world average for single house parliaments, which stands at 22.2 percent, but is only half of the average in Nordic

countries, which have the highest numbers of women legislators at 41.6 percent (IPU 2014).

There were several shifts that may have contributed to the large increase in representation of women in the legislature in 2000. First, electoral rules in the 2000 election were based purely on party list proportional representation, a system in which voters cast ballots for political parties rather than for specific candidates and the parties choose individuals from their candidate lists to hold office. Second, the Social Democratic Party (SDP), which included more women on its candidate list, received more votes than the conservative HDZ, which included fewer. Third, several of the major parties, including the SDP and the HDZ, had active internal women's organizations that worked toward creating better opportunities for women candidates. Finally, women's NGOs were active in raising awareness of women's rights, examining parties' attitudes toward women's participation, and creating training opportunities for women interested in political office (Glaurdic 2003).

Religious and Cultural Roles

Sociodemographics and Attitudes toward Marriage, Family, and Gender

Croatia reports high levels of religiosity and is one of the most religious countries in Eastern Europe (Kuhar 2014, 2). In the most recent census (2011), 86 percent of people identified as Roman Catholic, and fewer than 5 percent identified as not religious, atheist, agnostic, or skeptic (CBS n.d.). As a republic of socialist Yugoslavia, religion was confined to the private sphere. Catholic religious traditions were strategically reclaimed during the independence movement in the early 1990s to bolster a Croat ethnic national identity (Kuhar 2014, 3).

The 2008 EVS indicates that older women from rural backgrounds with primary educational attainment are very likely to rate religion as important in their lives, while middle-aged and younger women from urban areas with secondary or higher educational attainment are more likely to rate religion as not important (Nikodem 2012, 182). High levels of religiosity and traditional attitudes about the centrality and desirability of marriage, family, and children were not shown to be strongly connected across all ethnic differences in an analysis of data collected in the 1999 and 2008 EVS (Nikodem 2012, 189). Croats overall demonstrate more liberal attitudes about gender roles and similar attitudes about sexual norms compared

with those in other western Balkan countries, but attitudes differ by ethnicity within each country (Simkus 2007, 22–23.) Gender role attitudes related to work life have been shown to be strongly affected by educational attainment, followed by sex, while attitudes about sexual matters have been shown to be most affected by age, followed by educational attainment (Simkus 2007, 25).

Stereotypical gender norms are widespread and accepted in rural areas. Educational attainment, especially for women, is lower than in urban areas, and girls are socialized into roles that revolve around the household, child care, husband care, and the informal economy. Mothers are viewed as responsible for instructing their children in religious and moral values (Šikić 2007).

Politics and Culture

During the socialist period, communist ideology promoted an ideal society in which women's roles in the public sphere were on an equal footing with men's. The official values of the Communist Party included a high degree of gender egalitarianism regarding women's equitable participation in and contributions to public life. At the same time, patriarchal and sexist norms were, and still are, strongly in play within the realm of home and family life.

Immediately before, during, and, for a time, after the transition to independence and the development of Croatia as a pluralistic, free-market, free speech society, these official values about women's and men's roles were strongly influenced by ethnonationalist discourse and the Catholic Church, rather than communist ideology. Between 1985 and 1989, there was an increase in beliefs and attitudes about traditional gender norms, which tapered off as the war progressed, specifically regarding the ideas that men should be more involved than women in public-sector work and women should take primary responsibility for reproductive work within the home (Kunovich 2004, 1095).

During the Croatian independence movement of the early 1990s, political and ideological movements positioned women culturally as mothers and reproducers of the population. The ethnonationalist and socially conservative ruling political party, the Croatian Democratic Union (HDZ), was especially focused on creating an ethnically "pure" Croat population, and the Catholic Church was influential in pronatalist social policies during this time.

In 1992, the Ministry for Renewal was established in part to focus on the goal of increasing the birth rate

(Bijelić 2007, 282). This ministry's National Program for Demographic Renewal was headed by a Roman Catholic priest, Anto Baković (1931–), a pro-life activist (Bijelić 2007, 282). One initiative of the program was the creation of a pro-family incentive in which women with four or more children ("mother caregivers") would receive a salary and pension from the state. This particular incentive was included in the 2001 Labor Act, but due to concerns from women's NGOs about the effects of professionalizing motherhood and potentially pushing women out of the public realm, the wording was changed to "caregiver parent" to include fathers. Due to lack of funding, this policy has never been fully implemented.

Feminist organizations, such as Be Active, Be Emancipated (B.a.B.e.), spoke out against "retraditionalization," which included a patriarchal view of gender and could be seen as a way of shifting cultural values away from communist ideology toward pro-market nationalism. In particular, feminist groups such as B.a.B.e. commented on media representations of women, which included the commodification of women's bodies as a way to sell products, a strong antifeminist political discourse, and the framing of women solely in terms of their reproductive capacity and sexual and domestic value to men (B.a.B.e. 2002).

In the 21st century, women and men are equal under the law, and gender inequalities and gender-based discrimination are addressed widely in existing legislation. The EU accession process made attention to gender inequalities a necessity, and feminist NGOs and women politicians have consistently brought these issues to the fore. However, the day-to-day culture still undervalues femininity overall, positive identification with feminism is not widespread, and sexist attitudes contribute to women's relatively disadvantaged position according to standard societal indicators. In addition, there is an overall lack of awareness in popular culture about legal protections against discrimination, which may contribute to the continuance of discriminatory practices and to the low rate of reporting.

Issues

Feminism

Women's organizing, activism, and feminist discourse have been traced to the 19th century. A first wave of feminism in the Yugoslavian territories originated in urban areas, including Zagreb, in the 1890s. This activism focused on educational opportunities, legal rights, and suffrage (granted 1945). From the 1940s through the 1960s,

feminism operated formally within the Communist Party rather than as an external, grassroots, or independent set of voices, first through the Antifascist Women's Front, followed by the Union of Women's Societies, and then the Conference for the Social Activity of Women. During this time, abortion rights, equality under the law, and parental leave were codified in public policy, and gender equality, at least in the public realm, was a part of the Communist Party's ideology (Benderly 1997, 184).

Feminist activism and discourse reemerged in the 1970s in urban areas, including Zagreb, and focused on the needs of women as individuals rather than on their roles within and duties toward the state. In the 1980s, feminism continued as a New Social Movement along with movements addressing environmental concerns, gay liberation, and peace. There was a focus on grassroots activism on issues, including gender-based violence, and the general focus coalesced in the 1990s around antiwar, antinationalist activism (Benderly 1997, 192).

In the 1990s, feminists split along nationalist lines, and those who did not support the nationalist agenda were harshly attacked in a public backlash that played out in the media and in politics (Benderly 1997, 201).

Human Trafficking

The U.S. Department of State's annual *Trafficking in Persons Report* (TIP) places countries into three tiers based on their efforts to eradicate human trafficking within their borders. In the 2013 report, Croatia was downgraded from a Tier 1 country (complies with minimum standards to eliminate trafficking) to a Tier 2 country and remained at Tier 2 in the 2014 TIP. Victim identification and reporting is thought to be inadequate, and thus the magnitude of trafficking, particularly sex trafficking, is not clear (U.S. Department of State 2014, 146). Croatia is primarily considered a transit country for the trafficking of women and girls from neighboring countries for commercial sexual exploitation. Forced agricultural labor occurs within the borders of Croatia, and Roma children in Croatia are at risk of forced begging throughout Europe (U.S. Department of State 2014, 145).

Reproductive Rights

Beginning in 1952, women had fairly unrestricted abortion rights for up to 10 weeks after conception. Currently, women from the age of 16 may have unrestricted legal abortions within the 10 weeks following conception, while women under the age of 16 are required to obtain parental consent.

Permission for abortions in all other cases is overseen by a commission composed of a gynecologist and social worker associated with the facility where the service is sought. Abortions 10 weeks after conception will be granted in cases of rape and incest, severe congenital defects, and if the health of the woman is at risk during or after pregnancy. Counseling prior to obtaining an abortion is mandatory (Cvitanic 2011, 71; Bijelić and Hodžić 2014, 6).

There is an active pro-life movement, and the Catholic Church runs pro-life centers throughout the country; but to date, abortion rights have not been further restricted (Cvitanic 2011, 71). The abortion rate has been in decline, and in 2012, it was 4.4 per 1,000 women (Mishra, Gaigbe-Togbe, and Ferre 2014, 42). Government-run facilities provide assistance in family planning, and there is little available data about the rate of contraceptive use.

Family and Sexual Violence

Though included in the criminal code, domestic violence is still largely considered a private matter, and the vast majority of convictions are misdemeanors, not felonies. In 2010, 96.4 percent of the 17,335 reports were treated as misdemeanor offenses (Rogić-Hadžalić and Kos 2012, 16). Marital rape was included in the criminal code in 2003. Reported incidents of violence have been on the increase since at least 2001, though it is not clear whether domestic violence is increasing or growing awareness is contributing to more reports (Bijelić 2007, 290).

The 2003 Law on Protection against Domestic Violence addresses protective measures against stalking and harassment, such as restraining orders, and includes language regarding confiscation of weapons and psychological treatment for offenders. However, revictimization is prolific and occurs during the process of arrest as well as in the courtroom. Dual arrests, in which police arrest both parties rather than just the primary aggressor, are frequent. Judges may require both the victim and the perpetrator to testify while in close physical proximity within the courtroom. When children witness the violence, victims of the violence may be held responsible and prosecuted (Advocates for Human Rights 2012, 2).

Both government-run and NGO shelters exist, though they are few and inadequately address the real needs. The first hotline became available in 1988 and the first shelter in 1990, both in Zagreb, through the work of an independent women's organization (Krizsan and Popa, 2014, 769). In 2010, there were 18 existing shelters, and the

government-run shelters were not limited to victims of domestic violence, but also to trafficked individuals, asylum seekers, and others needing a high level of assistance (Advocates for Human Rights 2012, 93–94).

War-related sexual violence against women during the early to mid-1990s was common and especially well-documented in the conflict that took place in the Bosnian region in detention camps. Within the borders of Croatia, there are many firsthand accounts of sexual violence committed by soldiers (Ombudsperson for Gender Equality 2013, 32).

Czech Republic

Overview of Country

The Czech Republic is located in Central Europe, bordered by Poland to the north, Slovakia to the east, Austria to the south, and Germany to the west. Though Westerners often associate the Czech Republic with Eastern Europe, Prague, the capital city, is actually closer to Dublin than Moscow (Cravens 2006, 3). The country covers 30,450 square miles, slightly smaller than the area of South Carolina, and in 2014, the population was estimated at 10,644,842 (CIA 2016). The national language is Czech, which is categorized as a Slavic language alongside Polish, Russian, Ukrainian, Belarusian, Bulgarian, and Serbo-Croatian, and is spoken by 95.4 percent of the population. Ethnic groups in the Czech Republic include Czechs (64.3%), Moravians (5%), Slovaks (1.4%), other (1.8%), and unspecified (27.5%) (CIA 2017).

History

The earliest settlers in the Czech Republic were a Celtic tribe known as the *Boii*—the name Bohemia is derived from this word—around the fourth century. The first Slavs settled in the region during the fifth and sixth centuries. The Great Moravian Empire, which included Bohemia, Moravia, and sections of modern-day Poland, Germany, Hungary, and Slovakia, was established by the Slavic leader Mojmir around 830. The empire lasted until about 907, when it collapsed after Hungarian invasion. Between the ninth century and 1306, the Czech lands were ruled by members of the Přemyslid dynasty. Prague grew rapidly during this period; the lands had high political, economic, and cultural value, and Bohemia became an independent kingdom within the Holy Roman Empire in 950. When the Přemyslid dynasty died out, the House of Luxembourg came to power. Charles IV (1316–1378) was crowned king of the Czech lands in 1346 and was known as the "Father of the Homeland." He founded the first university in Central Europe, Charles University Prague, in 1348, and became the only Czech to be elected Holy Roman Emperor (Cravens 2006, 5–7).

In the beginning of the 15th century, Jan Hus (1369–1415), a Czech preacher, led a reform movement against the corruption of the Catholic Church and was burned at the stake for his ideology on July 6, 1415. After this event, Hus's followers, Hussites, began a protest movement that came to

be known as the Hussite Wars, which took place between 1420 and 1434. The Hussites elected George of Poděbrady in 1457, and he was the last Czech king (CIA 2014). In 1526, the rule of the Czech lands and Slovakia came to Ferdinand I of Hapsburg, beginning the Hapsburg rule that would last until 1918. In 1618, an anti-Hapsburg uprising began in Prague, which resulted in the Czech defeat at the Battle of White Mountain on November 8, 1620, and the initiation of the Thirty Years War. Ferdinand retaliated by executing 27 Protestant leaders on the Old Town Square.

The following period saw the purging of the Protestant nobility and intelligentsia and became known as the Dark Age in Czech history. German was made the official language, and the Czech written language died out for the next 200 years (Cravens 2006, 8–9). In reaction, the late 18th century saw a national revival movement that continued into the 19th century and included significant contributions to Czech language and literature. Many women, including novelist Božena Němcová (1820–1862), contributed significantly to this movement.

When World War I began, the Czechs and Slovaks were still under the Austrian monarchy and, when called to fight for Austria, defected and became known as the Czechoslovak Legion (Cravens 2006, 10). The Czechoslovak Republic was proclaimed at the end of the war in Prague on October 28, 1918, under the leadership of Tomáš Garrigue Masaryk. In the 1938 Munich Agreement, the dictators of Germany and Italy and the prime ministers of Great Britain and France agreed that Czechoslovakia was to surrender its borderlands to Germany, which resulted in the loss of one-third of its territory.

Hitler arrived in Prague on March 15, 1939, and announced the creation of the Protectorate of Bohemia and Moravia—a state within the German Reich and a puppet government under the control of Hitler. At the end of the war, both American and Russian troops prepared to liberate Prague, but the Soviet Army arrived first on May 9, 1945. In part because of this influence, Czechoslovak politics in the years after the war leaned in the direction of communism, and in February 1948, Czechoslovakia became a Soviet satellite until 1989. The new government staged trials in which a former member of Parliament and prominent feminist, Milada Horáková (1901–1950), was executed.

Social criticism arose in the 1960s among the intelligentsia and students; this movement toward a more democratic government and a new brand of socialism was known as the Prague Spring. This resistance prompted the invasion of 200,000 Warsaw Pact troops in 1968 and the

consequent return to totalitarian rule. When the communist governments in Central and Eastern Europe collapsed in 1989, peaceful resistance began in Czechoslovakia. Because of the nonviolence, this transition was known as the Velvet Revolution. In 1993, Czechoslovakia split into the Czech and Slovak Republics in the Velvet Divorce. The Czech Republic joined the European Union in 2004.

Religion and Politics

Despite the significance of religious figures such as Jan Hus in Czech history, it is the second most atheistic country in Europe behind Estonia (Cravens 2006, 23). A 2011 estimate cites the religious percentages as 10.4 percent Roman Catholic, 1.1 percent Protestant (including Hussite and Czech Brethren), 54 percent other and unspecified, and 34.5 percent none (CIA 2014).

Throughout most of the 20th century, Czechoslovakia's role in world politics was as a pawn for world powers: Germany during World War II and the Soviet Union after. In the 1990s, Czechoslovakia began to move toward a liberal-democratic political role and identification with the West through the foreign policy of Václav Havel and other politicians. This period was marked by a sense of confidence that the Czech Republic could play a role in the democratization of other nations (Cabada and Waisová 2011, 196). This confidence dissipated gradually beginning in 1993, and the focus shifted toward support and improvement of the Czech Republic's economy and its position among other European nations. Over the last 20 years, the Czech Republic has joined several significant international organizations, including the Organisation for Economic Co-Operation and Development (OECD), the European Union (EU), and North Atlantic Treaty Organization (NATO), and is characterized as a liberal-democratic political system based on a market economy (Cabada and Waisová 2011, 197). The constitution establishing the Czech Republic as a parliamentary democracy was enacted in 1992. The executive power is shared between the democratically elected president and the prime minister the president appoints.

Girls and Teens Education

Education in the Czech Republic has a long tradition: elementary education has been compulsory since 1774, and Charles University Prague, the oldest university in Central Europe, was established in 1348. The current literacy rate

in the country is over 99 percent. Elementary education is compulsory and takes around nine years; students are usually between the ages of 6 and 15. After compulsory education, students may attend upper secondary education (either general or vocational) before university or tertiary education. Of adults aged 25–64, 92 percent have earned the equivalent of a high school degree: 95 percent of men and 90 percent of women. Women made up 57.2 percent of university students in 2012, up from 45 percent in 2003 (OECD Better Life Index 2014).

Recreation

Many Czech children attend summer camps that include team sports, hiking, and camping. Soccer and tennis are particularly popular sports, and there is a long tradition of gymnastics clubs called *sokols* that have been in existence since the mid-19th century.

Young Adult Issues

A 2013 study of gender-specific prevention of drug use among Czech adolescents noted that of the 30 European countries studied in the European School Survey Project on Alcohol and Other Drugs, adolescents in the Czech Republic had the highest rates of alcohol, tobacco, and cannabis use (Novák et al. 2013, 904).

The 2009 UN Statistics Division recorded the birth rate among women from 15 to 19 years of age to be 11.8 per 1,000 women. These rates have been declining in recent years; between 1995 and 2000, the figure was 16.7 and has dropped to 11.1 between 2005 and 2010 (UN Statistics Division 2014).

Employment

Motivating Factors and Historical Opportunities

The Czech Republic shares a high level of female employment with other postcommunist countries in Central Europe. Vera Kuchařová has suggested that reasons for this include women's level of qualification and interest in working, employers' willingness to employ women, the fact that most families need two incomes, and a social-psychological motivation to work to gain independence and social status (Kuchařová 1999, 179). These factors, increased by the gradually improving equality and educational status of women, still contribute to the high employment rate of women in the Czech Republic. Comprehensive labor legislation was passed in 1991 and includes a "fair employment" clause to prevent discrimination, though

there has been some difficulty enforcing the clause since that time.

The Czech Republic has had a relatively high employment rate for women throughout the 20th century. In the 1930s, women made up more than 30 percent of the workforce, and by the end of communism in 1989, 94 percent of all Czech and Slovak women were working, due in part to the requirement and guarantee of employment under socialism (Cravens 2006, 47). During this period, women were seen as cheap sources of labor, and they were encouraged by government propaganda to work in typically "male" jobs. The government also established many day care centers and kindergartens to enable women to work. A positive feature under Czechoslovak communism was that women were able to retire at the age of 57 at the latest, and two years earlier for each child.

The situation of equality for women in the labor market has improved, but it is by no means ideal. There is still a great deal of occupational segregation, issues with balancing work and family life, and inequality of success in work. In 2012, the pay gap between men and women was 22 percent, which, while down from 25 percent in 2003, is still much higher than the EU average of 16.2 percent (EPIC 2014). In 2014, the Czech Statistical Office reported that the male employment rate was 77.3 percent and the female employment rate was 60.9 percent (Czech Statistical Office 2014). The percentage of women in private business has improved markedly since 1989, and necessary legislative measures for equality have been taken. However, problematic divisions still exist, including the need to balance work with family responsibilities.

Work and Motherhood

Again, the character of the balance between family life and work for Czech women can be traced back to the communist period. In the 1960s, the high level of female employment had the effect of decreasing birth rates and inciting fears of population decline and consequent shortages of labor. The government then developed "motherhood incentives." These incentives included extension of maternity leaves and allowances, tax incentives for married couples and childbirth, and increases in prices and restrictions for abortions. These changes had the effect of increasing the birth rate, but they entrenched certain gender divisions in society (True 2003, 36–37).

Today, though gender equality in the workforce has improved, a high percentage of Czech women have

difficulty reconciling work and family life. Some financial support is available to families, including a birth grant of 13,000 CZK (582 USD) and a child allowance between 500 and 700 CZK (22–31 USD) per month. Spending on family policies amounted to 1.2 percent of the gross domestic product (GDP) in 2011. Maternity leave typically begins 6–8 weeks before the due date and lasts for 28 weeks, including a maternity allowance that corresponds to income. Czech parents are also entitled to parental leave until the child is three, though only 1.8 percent of fathers take parental leave (EPIC 2014).

Around 5 percent of children under the age of three receive formal child care. Many of the government-established day care centers from the communist era have since been closed due to health and safety concerns: 1,043 nurseries operating in 1990 were reduced to 46 in 2010 (EPIC 2014). The government has begun to work toward improving this situation. A 2012 amendment to the Education Act hopes to allow the setup of company day care centers by providing a subsidy of 60 percent of day care operating costs. Despite these measures, a majority of Czech women still feel a responsibility to play equally full-time roles in work and family life, a situation that is often referred to as a “dual-burden” of labor.

Family Life

Health

In 1994, the Czech Republic introduced a privatized structure to end state control of health care services and to change the health care system inherited from communism. Despite higher costs, this restructure did give Czechs access to advanced medical technology, and the system compares favorably with other EU countries (Carter et al. 2014). The average expenditure on health care is slightly higher for women than men: 21,738 CZK (974 USD) per year for women compared to 19,502 CZK (874 USD) for men in 2010 (Czech Statistical Office 2014).

According to the most recent World Health Organization (WHO) statistics, the maternal mortality rate is 5 per 100,000 live births (WHO 2014). The 2013 UNAIDS report stated that there are currently 3,400 people living with HIV in the Czech Republic, and it did not differentiate male and female percentages (UNAIDS 2014).

Abortion

Abortion has been legal in cases of health endangerment and genetic defect since 1950; abortions performed for

other reasons could result in imprisonment of the woman for 1 year and of the person performing the abortion for up to 10 years. In reaction to the dangers of illegal, underground abortions, the Czech government legalized abortion based on medical or “other important reasons” in 1957. These “other reasons” were gradually clarified and changed until an amendment to the law in 1986 disestablished “abortion commissions” and stated that the decision for abortion was between the woman and her doctor. Currently, abortion requires the consent of the woman and her gynecologist.

Abortion is permitted up to 12 weeks of gestation, which is extended to 24 weeks in the case of medical indications and at any time in case of grave problems with the fetus (Dudová 2010, 945–947). In 2013, the Czech Statistical Office reported 36,687 total abortions and 35.2 abortions per 100 live births. These numbers have declined dramatically from the early 1990s (109,281 abortions and 89.5 abortions per 100 live births in 1992), but the number of abortions per live births has increased slightly since 2010 (Czech Statistical Office 2014).

Family and Household Roles

Many women in the Czech Republic take pride in balancing their work and family roles. Despite the history of high involvement in the labor market, women have still generally been responsible for a large portion of child care and domestic responsibilities. A 2008 study found that men in Czech households spent an average of 10 hours per week on housework compared to 24 hours for women, and the older a husband is compared to his wife, the more housework she tends to do (Voicu, Strapcová, and Voicu 2008, 11; 13).

In 2012, there were 4.3 marriages per 1,000 inhabitants and 2.5 divorces per 1,000 inhabitants. Births outside of marriage made up 43.4 percent of the total live births (Eurostat 2014). In general, there has been a movement toward a “contemporary method of reproduction,” which includes marrying at a later age, an increasing divorce rate, childbearing at a later age, more births outside of marriage, and a decreased abortion rate.

Politics

Feminism

There are several historical reasons for the unique character of feminism in the Czech Republic, beginning with the widespread participation by women in the nationalist movement in the 19th century. During this time, women

campaigned for human rights and national goals, such as Czech independence, instead of specific women's issues. Because of the prominent role played by women in advocating independence and establishing the Czech national literature, the status of women in the new Czechoslovakia was favorable, and suffrage and the right to stand for office were recognized in 1918.

Like many aspects of Czech culture and politics, though, feminism has been dramatically influenced by the transition from communism since 1989. In some ways, the socialistic ideology of equality gave way to a reinforcement of the masculinist culture and gender inequality. Though oppression of women certainly existed during communism, it was politically invisible. During the communist period, women were given equality and an obligation to work, but they also continued to be responsible for child care and household tasks. Though women were legally equal under socialism, the division of labor was still unchanged, and there was little progress toward truly equal gender roles during that time. Communism also facilitated derision toward *bourgeois feminism*, the legacy of which is still present in current conceptions of Czech feminism. Some gender studies scholars have claimed that the experience of socialism can be seen as emasculating, and men have since reasserted their masculinity by reinforcing gender divisions (True 2003, 23).

Thus, feminism has a particularly fraught history in the Czech Republic; the word *feminism* is layered with negative connotations, and even women who largely agree with the ideology of "Western feminists" would prefer to label themselves "pro-woman" in a Czech context. Jirina Siklová, a prominent Czech women's scholar, has characterized this issue by suggesting, "We frequently use the same words . . . yet their context is different because different historical experiences underlie the same concept" (Siklová 1997, 76). Women's attitudes in the Czech Republic are neither directly compatible with Western feminism nor with traditional patriarchy. "Feminism Czech style" is one way the unique qualities of Czech feminism have been described, a definition that comprises a mixture between attachment to the labor market and strong family values and a sense of personal independence (Ferber and Raabe 2003, 409). Both men and women tend to see paid work and domestic and family tasks as compatible for women, and Czech women tend to take pride in balancing the two (Ferber and Raabe 2003, 418).

Czech women have played a vital role in advocating against corrupt governments and for nationalistic and

humanitarian issues, but they have on the whole evidenced less identification with feminism than other nations. Though individual women have been reluctant to identify with feminism, women's nongovernmental organizations (NGOs) have advocated for particular issues, including trafficking, lesbian rights, single mothers, prostitution, and the environment, and young Czech women are moving in the direction of a reevaluation of the view of feminism, though perhaps under a different name.

Women in Politics

Since the Czech Republic joined the European Union in 2004, the involvement of women in politics has been considered a marker of how democratic the country has become. Traditionally, the Central and Eastern European region has seen a significantly lower percentage of women politicians compared to the rest of Europe. Some of the barriers to the involvement of women in Czech politics include the dual burden of work and domestic responsibilities and entrenched gender inequalities (Galligan and Clavero 2005, 985). In the Inter-Parliamentary Union's (IPU) ranking of participation of women in politics, the Czech Republic is currently 72nd out of 189 countries (Šprincová and Adamusová 2013). Czech politics displays an inverse relationship of women in politics: the higher the decision level, the lower the number of women. There is also a higher percentage of women in departments that reflect the image of a feminine caretaker, including the family and social areas, health care, education, and culture. At the European parliamentary level, only four Czech women were elected in 2009, which was the second-lowest result of the member states (Šprincová and Adamusová 2014).

The situation is slightly better at the national level. In 2013, there were 19.5 percent women to 80.5 percent men in the lower house of the Czech Parliament and 17.3 percent women to 82.7 percent men in the upper house. In overall government, there are 6.7 percent women to 93.3 percent men. Women's participation in local assemblies is the highest, with a rate of 26 percent women to 74 percent men (Šprincová and Adamusová 2014). Several notable Czech female politicians include Karolína Peake, the first woman to hold the position of deputy prime minister; Vlasta Parkanová, who served as minister of defense; and Jaroslava Moserová, who served as vice president of the Senate of the Czech Republic and ran for president in 2003.

Religious and Cultural Roles

Women and Religion

Women's roles in religion are somewhat limited due to the atheistic nature of the country. During communism, the Catholic Church was significant as a site of resistance to communism, and during that time, the church responded to a shortage of priests by allowing women to be ordained. Postcommunism, however, the church has refused to recognize this choice and made women church deacons instead.

Women in the Arts

In literature, women writers have been particularly influential in the tradition of the novel. Božena Němcová (1820–1862) was a writer during the Czech National Revival movement, and her image is on the 500 denomination of the Czech crown. Her most famous novel, *Babička* (*The Grandmother*), was published in 1855 and is based on a young girl's relationship with her grandmother during her childhood in the countryside. That novel has been viewed as one of the most respected and influential works of literature written in the Czech language. Eliška Krásnohorská (1847–1926) is significant as an early Czech feminist writer; she also wrote the libretti for several operas, lyric poetry, and translations. Heda Margolius Kovaly (1919–2010) wrote a significant memoir of her time in a concentration camp and in Prague during World War II; it was published in English in 1986 as *Under a Cruel Star—A Life in Prague 1941–1968*.

Women writers were also particularly influential under socialism, though many served as editors, publishers, and translators rather than writers and were thus given less credit for their efforts. Eva Kantůrková (1930–) has written both novels and screenplays, in which she deals with themes of the repression of Czech dissidents. Daniela Hodrová (1946–) has written several significant intellectual novels that reinscribe traditional religious narratives onto contemporary women in Prague; she won the Franz Kafka Prize in 2012. Květa Legátová (1919–2012) wrote a 2001 collection of short stories, *Želary*, and the 2002 book *Jozova Hanule*, which together were adapted into the 2003 film *Želary* that received the 2004 Academy Award for Best Foreign Language Film. In contemporary poetry, Marie Šťastná (1981–) is a name to watch; Šťastná has already had a prolific career, and she won the Dresdner Lyrikpreis prize in 2010. In popular literature, it is important to

note the status of Harlequin romance novels in the Czech Republic. In opposition to perspectives in the United States, Harlequin romance novels have a positive image in Czech society, in part because the novels are often considered a symbol of liberation in the postcommunist era.

In music, famous Czech women include Maria Jeritza (1887–1982), who was a soprano who performed with the Vienna State Opera and the New York Metropolitan Opera. Ema Destinnová (1878–1930) also performed operatic soprano both in Europe and with the New York Metropolitan Opera. Markéta Irglová (1988–) is a songwriter and musician, and, with Glen Hansard, she won the 2008 Academy Award for Best Original Song for “Falling Slowly” from the film *Once*. Věra Chytilová (1929–2014) was an avant-garde Czech filmmaker and often called the “first lady of Czech cinema.” She is best known for her 1966 film *Sedmikrásky*, which epitomizes the New Wave Czech cinema genre.

In art, women have been particularly influential in contemporary painting. Olga Karlikova (1923–) is categorized as a meditative painter; she works in traditional landscape painting with a modern form (Pecinkova 1993, 54). Adriana Simotova (1926–) is a particularly original figure in contemporary Czech art. She studied graphic arts, and her style has developed into an original, conceptual representation using unconventional media and techniques. Eva Svankmajerova (1940–) is a member of the Surrealist group of painters. Her paintings deal with issues of pop-art, literary and poetic expression, and feminist ideas. Jitka Valova and Květa Valova (1922–) are twin sisters who both work with themes of social realism and the changing political climate of the Czech Republic; their paintings exhibit different stylistic qualities, but they are generally interpreted using their relationship to each other.

Issues

LGBTQ Issues

Czech legislation removed the culpability of homosexual sexual relations in 1961 (Benová et al. 2007, 25). The age of consent was equalized in 1990; previously, the age boundary had been 18 for same-sex and 15 for opposite-sex relationships. Though progress toward equality has been made since that time, the LGBTQ community in the Czech Republic still faces issues of inequality and prejudice. Particular at-risk groups within the LGBTQ community in the Czech Republic include the elderly, people who are ill, ethnic minorities, people in rural areas, and socially outcast teenagers (Benová et al. 2007, 14).

Historically, the public life of LGBTQ people in the Czech lands can be analyzed from the late 19th century, when associations advocating for the decriminalization and acceptance of homosexuality came into being. The first of these was the German Wissenschaftlich-humanitäre, established in 1897 under the direction of Magnus Hirschfeld. Articles in the *Modern Revue* supported Oscar Wilde in his 1895 trial, and during the First Republic period, magazines titled *Voice of the Sexual Minority* and *New Voice* were published, advocating similar issues. During World War II, in Czechoslovakia as well as the rest of Europe, people suspected of homosexuality were persecuted and had a very high mortality rate (Benová et al. 2007, 16).

During communism, the culpability of homosexuality largely fell by the wayside, and equality has been gradually improving since that time. The Association of Organizations of Homosexual Citizens (SOHO), composed of roughly 30 associations across the Czech Republic, advocated for political visibility and to remove discrimination from 1990 to 2006. The lesbian community also developed its independent identity throughout the 1990s, focusing on similar issues to SOHO, as well as the relationship between feminism and the lesbian community.

Though gay marriage is not yet legal, the Czech Republic has offered registered partnerships for same-sex couples since 2006. These partnerships' rights include hospital, inheritance, spousal privilege, and alimony, but they do not allow adoption, widow's pension, or joint property. There are no comprehensive provisions on hate crime. Crimes toward members of a sexual minority are statistically included with other crimes, and thus no precise statistics exist.

Violence against Women

The secretary-general of the United Nations has described violence against women as "the most shameful human rights violation and perhaps the most pervasive" (UN Development Fund for Women 2003, 8). Violence against women takes many forms, from intimate partner violence to genital mutilation and sex-selective abortions, and it is prevalent to varying degrees around the world. The consequences of violence against women range from physical and psychological injury, economic issues, substance abuse problems, and consequences for reproductive health.

The International Violence against Women Survey (IVAWS) is an initiative that began in 1997 and has since

been working to compile accurate data on the perpetration of violence against women around the world. Data from the IVAWS compiled in the 2008 publication *Violence against Women: An International Perspective* is particularly useful in sketching the landscape of violence against women in the Czech Republic. Of the total sample of women in the Czech Republic, 36 percent said that they had not experienced violence, 51 percent said that they had experienced physical violence, 35 percent said that they had experienced sexual violence, and 25 percent said that they had experienced childhood violence (Johnson, Ollus, and Nevala 2008, 36). Compared to the other countries laterally compared (Australia, Costa Rica, Denmark, Hong Kong, Mozambique, Philippines, Poland, and Switzerland), the rate of physical violence experienced by women in the Czech Republic was the highest of the countries mentioned. The percentage of Czech women who reported having experienced any kind of violence perpetrated by a current or previous intimate partner was 38 percent, physical violence was 36 percent, and sexual violence was 14 percent. Comparatively, the Czech Republic has a very high rate of intimate partner violence.

The prevalence of gender-based violence is closely connected to socioeconomic and cultural gender inequality, and residual patriarchal ideology in the Czech Republic may be a contributing factor to this issue. The percentages of violence perpetrated by men other than intimate partners (relatives, acquaintances, and strangers) are quite similar: 35 percent any violence, 21 percent physical violence, and 25 percent sexual violence (Johnson, Ollus, and Nevala 2008, 54-5).

The prevalence of prosecution of violence against women, particularly intimate partner violence, is also an issue. In the first eight months of 2010, there were 407 cases of domestic violence reported, and only 220 of these were prosecuted (Advocates for Human Rights 2012). Of course, this figure also does not include unreported cases of intimate partner violence. The Czech Republic has a comparatively low percentage of victims who reported violence to the police: 7 percent if the perpetrator was a current partner, 9 percent if a previous partner, 7 percent if an acquaintance, and 16 percent if a stranger. Of women who did report domestic violence, there was also a low level of satisfaction with the police response: 27 percent in the Czech Republic compared to 94 percent in the Philippines. Barriers to reporting include situational and personal factors, concerns about privacy, negative experience with police response, and fear of personal repercussions, including children being taken away (Podaná 2010, 457).

In 2006, the Czech Republic adopted domestic violence legislation, which gave domestic violence distinct status as a crime. In 2009, the Act Law on Police was passed, which permits the police to exclude the perpetrator of domestic violence from the residence for a period of 10 days and provides them with some domestic violence-specific training (Advocates for Human Rights 2012). Domestic violence offenders may face up to three years in prison, with extended sentences for aggravated assaults. Rape is punishable by sentences of 2–15 years in prison. The Czech government considers violence against women to be a human rights issue, and as such, it is considered alongside priorities and procedures for promoting gender equality. NGOs that include ROSA, proFem, Gender Studies, and Elektra have also been working to end the problem by providing information to the public and professional help to victims of domestic violence.

A sexual harassment policy was enacted by the Czech legislature when the Czech Republic entered the European Union in 2004, but it continues to be a problem as the law is largely unenforced. Sexual harassment is mainly perpetrated by coworkers and superiors as an assertion of power. One-quarter of respondents to a research study claimed that they had experienced sexual harassment, including sexually oriented comments, unwanted bodily contact, sexual proposals, and assault (Advocates for Human Rights 2012). Among Czech university students, only 23.7 percent of women considered sex-based disadvantages to be considered sexual harassment; thus, improvement to this situation may require a significant reevaluation of terms and perspectives on sexual harassment in both the university and workplace (Vohlídalová 2011, 1137).

Despite NGO, Czech governmental, and international initiatives to end violence against women, it is still a disturbingly prevalent issue both within the Czech Republic and internationally. Strategies for improving the situation include promoting gender equality, improving services and support for victims, holding offenders accountable, prevention methods, improving statistical awareness, and enacting and enforcing new legislation (Johnson, Ollus, and Nevala 2008, 170–175).

Trafficking

Trafficking in persons is a major human rights violation and a continuing problem in the Czech Republic. Sexual trafficking is defined as luring, hiring, or transporting a woman abroad with the intention of using her for

sexual intercourse with another person, but trafficking also includes forced labor. In the Czech Republic, men and women in forced labor primarily work in the construction, automotive, agricultural, and service sectors. With the 2013 publication of the first edition of the “Global Slavery Index” compiled by the Walk Free Foundation, it was reported that the Czech Republic has the 3rd-highest level of slavery in Europe, after Albania and Montenegro, and the 54th worst in the world with an estimated 36,000–40,000 persons enslaved (Walk Free Foundation 2013). Trafficking, for both sexual and labor purposes, is a severe violation of the rights of human safety, dignity, freedom of movement, self-determination, and privacy.

The Czech Republic was originally a source country: people would be transported to serve in the sexual and labor industries of other countries. Today, as well as being a source country, the Czech Republic is also a transit and destination country. In 2008, the sexual industry in the Czech Republic generated 760 million USD in revenue (Advocates for Human Rights 2012). Trafficking continues to be one of the most serious problems faced by the Czech Republic. Women from the Czech Republic, Bulgaria, Moldova, Nigeria, the Philippines, Romania, Slovakia, Ukraine, and Vietnam undergo forced prostitution in the Czech Republic as well as traveling through the country en route to Western Europe. Women from the Czech Republic are often subjected to forced prostitution in other countries, including the United Kingdom (U.S. Department of State 2014).

Sexual trafficking has been given more media attention than labor trafficking both in the Czech Republic and at the international level. A 2012 documentary, *The Tree Workers Case*, directed by Daniela Agostini, focuses on more than 2,000 workers from Vietnam, Romania, Bulgaria, Hungary, and Slovakia who were lured with false contracts and forced to work for the Czech Republic’s state forestry firm, Lesy ČR. The workers were not paid or paid very little and lived in miserable conditions with insufficient food. The Czech Republic and the forestry firm both denied involvement with this issue, but the documentary and other efforts by NGOs are working to create more awareness of the labor trafficking issue.

There have been efforts by NGOs and the Czech government to eliminate the problem, and the Czech Republic does meet the minimum EU standards for the elimination of trafficking. In 2010, the Criminal Code was revised to prohibit all forms of human trafficking, and in 2012, the

Czech courts issued the first rulings in labor trafficking cases. Previously, trafficking cases had typically been judged as fraud rather than under specific antitrafficking laws. There were 19 investigations of human trafficking in 2011, 24 in 2012, and 18 in 2013. Government-funded shelters provided aid to 55 trafficked persons in 2012.

Law enforcement in the Czech Republic includes an antitrafficking unit, and the government has begun to collaborate with foreign governments in trafficking investigations as of 2012 (La Strada International 2014). NGOs, including La Strada, provide advocacy, prevention, education, assistance, and lobbying measures, and they received USD\$397,000 in support from the Czech government in 2010 (Advocates for Human Rights 2012). The 2014 *Trafficking in Persons Report* made the following recommendations to the Czech Republic: ensure that trafficking victims are explained their rights; implement new monitoring, investigating, and prosecuting measures; ensure workers are given contracts they are able to understand; increase training for judges and law enforcement; provide shelter space; provide medical attention; prosecute sex and labor trafficking cases more severely; coordinate with neighboring EU nations; provide targeted outreach to vulnerable groups; and increase public awareness (U.S. Department of State 2014).

Sexual Objectification

The postcommunist period in Central and Eastern Europe has seen a sharp rise in the prevalence of prostitution and pornography. This, along with media representation and international stereotyping, has led to an alarming level of sexual objectification of Czech women. In 2010, after a record number of 44 women had gained seats in the lower house of Czech Parliament, a charity calendar was released showing some of the female politicians in seductive poses. Though some viewed this as a liberating gesture, others argued that it would continue to reinforce stereotypes of Czech women as valuable primarily based on their appearance. Dating sites that claim to offer the opportunity to meet Czech women abound, and Central and Eastern European women in general are sexualized in Western popular culture. It is considered particularly difficult to obtain a job on television or as a news anchor in the Czech Republic, as the competition of physical attractiveness is so intense.

Particularly among Western men, the stereotype remains that Czech women are beautiful, educated, and untouched

by the unattractive qualities of Western feminism, and many Western men travel to Prague seeking love or sex (Cravens 2006, 43). This stereotype leads to consequences of creating unattainable ideals of beauty, proliferating gender inequality, and reinforcing barriers to political involvement and career advancement for women and to the prevalence of violence against women.

D

Denmark

Overview of Country

The Kingdom of Denmark is a small country located in Northern Europe. It is one of five countries referred to as Nordic countries, a category that also includes Sweden, Norway, Finland, and Iceland. Geographically, the largest part of Denmark is the Jutland peninsula, which connects Denmark to Germany. The rest of the country consists of small, scattered islands. The capital of Denmark is Copenhagen, which is located on the island of Zealand. In addition to being the capital, Copenhagen is also the largest city in the country. The second-largest city is Aarhus, followed by Odense. As of 2017, the population of Denmark was 5.7 million people (Ministry of Foreign Affairs 2017b).

Denmark has a long and rich history that dates back even before the age of the Vikings (ca. 800–1100). Today, the Danes are known for enjoying a high quality of life. Denmark consistently ranks among the top countries in world happiness reports, and it frequently leads the way in maintaining some of the highest standards of living.

From a global perspective, Denmark ranks highly in terms of gender equality. According to the 2015 United Nations Development Programme's (UNDP) *Human Development Report*, Denmark is second out of 188 nations for gender equality, with a 0.041 Gender Inequality Index (GII) rating (UNDP 2015). Although Denmark is often a

pioneer for women's issues, Danish women still face many of the same challenges as women in other countries.

Girls and Teens

Extracurricular Activities

The everyday lives of Danish girls and teenagers are similar to those living in Western Europe. Both young girls and boys help around the house and are not assigned specific tasks based on gender. When a girl is old enough, she may also obtain a part-time job, which will enable her to have her own spending money for shopping or entertainment. Denmark is part of the European Union (EU), which means that Danish students have the option of working abroad in other EU countries. Danish teens also frequently travel to other countries in the EU for fun. Like many teens in Western Europe, Danish girls also enjoy spending time with their friends.

Teen Issues

On average, teens in Denmark become sexually active around the age of 15. Most Danish parents are accepting of the fact that teenagers have sex lives and are more relaxed in their attitudes than parents in other countries. Teen pregnancy and abortion are not major problems in Denmark due to sex education programs and informational campaigns. Of the 34,000 teen girls who become sexually

active at 15, it is estimated that only 10 will become teenage mothers (Statistics Denmark 2015, 19).

Danes are among the heaviest drinkers in Europe, a factor that extends to teenagers. The legal drinking age in Denmark is 16. A large percentage of young men and women aged 16–24 regularly consume above the recommended alcohol limit, and 40 percent of 15-year-olds say they have been drunk at least twice in their lives (OECD 2013, 46; Olejaz et al. 2012, 14).

Health

Access to Health Care

Denmark is known as a welfare state, which means social services such as education, retirement, and health care are funded by the government. In Denmark, the state pays for 80 percent of the health care costs of its citizens with funds collected through taxation. This cost accounts for nearly one-third of Denmark's gross domestic product (GDP) (Statistics Denmark 2015, 11). About 95 percent of the population use these health care services each year (Ministry of Foreign Affairs 2017b).

Despite having a well-funded health care system Danes have one of the lowest life expectancy rates in Europe. On average, men live to be 77 years old, and women live to be 82 years old (CIA 2017). Many factors account for this, such as the consumption of rich foods and high rates of alcohol and tobacco use.

Maternal Health

Maternal health in Denmark is very high, with a maternal mortality ratio (MMR) of only 6 maternal deaths per 100,000 live births (WHO, UNICEF, UNFPA, World Bank Group, and the United Nations Population Division 2015, 51). According to the Save the Children's 2015 Mother's Index Rating, Denmark is the fourth-best place in the world to be a mother (Save the Children 2015, 9). This index takes into account various factors concerning the health and well-being of mothers and their children.

Contraception and Abortion

Danish women have legally had access to contraceptives since 1966. In general, the age when women first start using hormonal contraceptives is becoming younger. Approximately 85 percent of Danish women have been prescribed hormonal contraceptives by the time they reach 20 years of age (Løkkegaard and Nielsen 2014, 1).

In Denmark, abortion is legal through the first trimester. Women over the age of 18 have access to abortions on demand, and women under the age of 18 can obtain an abortion with parental consent. In 2013, 15,300 abortions were performed in Denmark. Women aged 20–24 were the most likely to undergo the procedure (Heino and Gissler 2015, 14).

The first law allowing women to legally obtain abortions was passed in 1937; however, only women who were at risk of losing their lives due to pregnancy complications were able to undergo the procedure. In the mid-1960s, students at the University of Copenhagen hosted an "abortion week" to talk about abortion rights. This event attracted many participants and sparked conversations about abortion on demand. Women's organizations picked up the cause and coordinated further events and demonstrations that attracted the attention of politicians and the public. In 1972, a bill was introduced in Parliament that would make abortion on demand legal, and in 1973, the bill became law.

Cancer

Cancer is the number one cause of death in Denmark, followed by heart disease. Among women, breast cancer is the most commonly diagnosed type of cancer (OECD 2013, 126–127). While the rate of individuals dying from heart disease has declined, there has been a huge increase in the number of cancer diagnoses and mortalities since the 1980s (Statistics Denmark 2014, 16).

Sexually Transmitted Diseases

The number of people diagnosed with HIV/AIDS has dramatically declined in recent decades. The peak year for the number of new diagnoses was 1993, with 239 diagnoses. As of 2013 that number dropped to 38 new diagnoses. Newly diagnosed individuals are also living longer due to better treatment options.

Danish men have a much higher rate of gonorrhea and syphilis than Danish women; however, women account for more cases of chlamydia than men (Statistics Denmark 2014, 69; European Centre for Disease Prevention and Control 2013, 55, 61).

Mental Health

Denmark is one of the highest consumers of antidepressants in the world (OECD 2013, 102). Suicide accounts for 1.3 percent of deaths. Danish men are three times more likely than women to commit suicide (Statistics Denmark 2014, 16).

Alcohol and Tobacco

The number of Danish smokers has decreased in recent decades. Between 2000 and 2010, the number of smokers dropped from 33 percent of the adult population to 24 percent (Olejaz et al. 2012, 13). In 2007, the National Institute of Public Health and the National Board of Health passed a law that banned smoking in public spaces. This law has helped contribute to the decline in the number of Danish smokers. However, Denmark still has the highest percentage of female smokers among Nordic countries (Nordic Council of Ministers 2015, 15).

The majority of Danes drink alcohol on a regular basis. It is estimated that there are 860,000 heavy drinkers in Denmark (Gottlieb Hansen et al. 2011, 132). Men drink more frequently than women and are more likely to drink beyond the recommend intake of alcohol (Olejaz et al. 2012, 14).

Elder Care

Despite the fact that Danes on average do not live as long as other Europeans, Denmark still has a large percentage of elderly individuals, with nearly 17 percent of the population aged 65 or older (OECD 2013, 179). More than half of people over the age of 80 receive assistance from a caregiver or live in a care facility. Women make up the majority of this group with 87,000 elderly women living in care facilities versus 30,000 men (Statistics Denmark 2014, 75). In the past 25 years, there has also been a large increase in the number of people living over the age of 100. In 1980, there were 118 women and 40 men aged 100 or older. This number has since grown to 840 women and 156 men aged 100 or older (Statistics Denmark 2014d, 12).

Education

The Danes place a high emphasis on quality education. On average, Danes attend 18 years of school. Denmark has a 99 percent literacy rate for both men and women (WEF 2014).

Primary and Secondary Education

All children are required to attend school from the age of 6 or 7 until age 16. This period of education is known as *Folkeskole*. Parents have the option of sending their children to public school or private school, or they may homeschool (Ministry of Education 2017a). Students in public *Folkeskole* take courses in three main areas of study: humanities, practical and creative subjects, and science subjects. They

also learn about driver's safety, sex education, and different vocational opportunities. In addition to Danish, students begin learning English in the third grade and add German or French when they reach the seventh grade (Ministry of Education 2017c).

Once students reach ninth grade, they can choose whether they want to continue their education or pursue a vocational path. Approximately 60 percent of students choose to continue their studies and attend three years of high school. In high school, or upper secondary school, students can choose to pursue one of four different courses of study. Students interested in science and technology can select the htx programme, while students who want to study economics and business can follow the hhx programme. The final two programs, stx and hf, are for students interested in the humanities and social sciences (Ministry of Education 2017b).

Higher Education

Once a student completes three years of high school, they can apply to a university. As part of the welfare state model, education is free. Along with free tuition, students who are admitted to a university also receive a monthly stipend from the state to help cover the cost of living.

Higher education in Denmark includes short-cycle programs (such as vocational programs), medium-cycle programs (similar to bachelor's degrees), and long-cycle programs (including master's and PhD degrees). Women outnumber men in medium-cycle education, especially in the areas of teaching, nursing, and social work. Men make up the majority of students enrolled in vocational programs. In 2000, the number of women in long-cycle education surpassed the number of men. Some of the programs included in long-cycle education are architecture, medicine, and law (Statistics Denmark 2015, 11).

Faculty Positions

Women only hold 16 percent of faculty positions at Danish universities (Ministry of Higher Education and Science 2014). Other Nordic countries face this issue as well. In 2015, NordForsk, which reports to the Nordic Council of Ministers, appointed a committee to further investigate this issue. Some universities are developing their own strategies to address this inequality. For example, the University of Copenhagen has introduced an incentive program for departments who meet a specific gender quota. If the quota is met, the department receives funding for a new professorship.

Adult Education

For the Danes, learning is a pursuit to be enjoyed throughout an individual's entire life. The institution of the Folk High School is meant to support this idea. There are 70 Folk High Schools in Denmark where adults can attend courses for the pure enjoyment of learning. Students can take classes on a variety of subjects, such as physical education, the arts, or spirituality. All but one of these schools is residential, and courses can last from a few weeks to a few months (Ministry of Foreign Affairs 2017a).

Employment

The average work week in Denmark is 37 hours, with five weeks of paid vacation time each year. Workers in Denmark pay some of the highest income taxes in the world, which in turn help fund the many different services that the government provides. According to a 2016 report from the OECD, an average worker without children would be taxed at a rate of about 36 percent (OECD 2017).

Historically the rate of women who are unemployed has been greater than men; however, the global financial crisis of 2008 changed that. Women and men now have the same rates of unemployment, at 7.4 percent (Statistics Denmark 2015, 15).

Typical Jobs and Careers

Danish women have been part of the workforce since the 1800s, when they were first employed as factory workers, seamstresses, nurses, and teachers. During this time, Danish women even formed their own unions in protest of unequal pay and poor working conditions. However, large numbers of women did not enter the workforce until the 1960s. During this decade, the growing Danish economy was in need of more laborers, and so it became more socially acceptable for women to take jobs outside of the home.

Today, nearly as many women as men are part of the workforce. Danish women also have the highest rate of employment compared to women in other EU countries (Jørgensen 2011). While large numbers of women make up the workforce, the Danish job market remains one of the most segregated job markets in Europe. The majority of women work in the public sector, whereas 80 percent of men work in the private sector. Women commonly have jobs in the fields of health care, education, and social services (Fiig 2009, 319).

Discrimination and Income Disparity

In 1976, the Danish Parliament passed the Equal Pay Act, which was aimed at reducing the wage discrepancy between men and women. Despite this law, the wage gap in Denmark is still between 14 percent and 18 percent, and it has remained more or less unchanged for the past few decades. While part of the pay discrepancy can be attributed to working in different job sectors and varied personal qualifications, these factors do not account for the entire wage gap.

In addition to earning less than men, women are also more likely than men to work part-time jobs, though this has decreased significantly since the 1970s. Immigrant women also face many additional challenges. It can be more difficult for these women to obtain jobs due to limited educational backgrounds and discrimination. As a result, immigrant women are at a higher risk of unemployment.

In the workforce, Danish women are not well represented in positions of authority. Women only hold 12 percent of powerful decision-making positions in politics, public industry, academia, and other sectors. In male-dominated fields, such as the private sector, women hold an even smaller percentage of decision-making positions (Fiig 2009, 323).

Maternity Leave

Danish women are able to enjoy careers and motherhood simultaneously due to various government programs. New parents are entitled to 50 weeks of parental leave. Mothers receive 4 weeks of leave before giving birth and 14 weeks of leave after. Fathers receive 2 weeks of leave after the birth of a child. About 58 percent of fathers choose to take this leave. Parents receive an additional 32 weeks of leave, which they can divide up any way they choose (Blomqvist 2006a). After parents run out of parental leave they have the option of enrolling their children in state child care, which is fully funded. Caretakers or child care institutions look after 68 percent of children ages 2 and under, 97 percent of children ages 3–5, and 86 percent of school-age children (Statistics Denmark 2014, 74). Additionally, parents receive stipends from the government that assist with the costs of raising children under the age of 17.

Family Life

Marriage and Partnerships

Marriage is still the most popular form of commitment, and 76 percent of people who live together are married

(Statistics Denmark 2014, 16). However, over the past 30 years, it has become increasingly common for couples to live together without getting married. When Danes decide to get married, they usually do so later in life. The average age for women to marry is 32, and the average age for men is 35 (Statistics Denmark 2015, 5).

Denmark was the first country in the world to recognize same-sex civil partnerships, which became legal in 1989. In addition to same-sex civil partnerships, same-sex marriage became legal in 2012. Under this law, the Church of Denmark must allow same-sex couples to marry in church. While individual priests can refuse to perform the ceremony, the church must find a replacement for the couple. Since the law passed, more same-sex couples are opting for marriage over partnership. In 2016, there were 218 marriages between same-sex female couples versus 3 registered partnerships, and there were 160 marriages between same-sex male couples versus 3 registered partnerships (Statistics Denmark 2016).

Children

Since the 1970s, Danish women have been waiting longer to have children. Today, the average age for a first-time mother is 29 years old. The fertility rate in Denmark is 1.7, which is slightly higher than the European average (Statistics Denmark 2015, 6).

In 1999, it became legal for same-sex partners to adopt their stepchildren, and in 2010 Parliament passed a law that allowed registered partners the right to adopt children together. With passage of this recent law, same-sex couples now have the same adoption rights as heterosexual couples.

Divorce

Denmark has the highest divorce rate among Nordic countries, with 46 percent of marriages ending in divorce (Statistics Denmark 2015, 5). In the event of a divorce, women are more likely to become single parents than men, with single mothers numbering 233,376 versus 41,908 single fathers (Statistics Denmark 2014d, 45).

Household Roles and Responsibilities

The past few decades have also seen shifts in household roles. The amount of time that men contribute to household chores has risen since the 1990s; however, women spend more time on chores than men.

Sports and Leisure

In Denmark, going out for entertainment or a meal can be expensive. As a result, Danes often prefer to spend time with family at home. The majority of Danes live in single-family homes, and they place a high value on making these homes into comfortable spaces. An important concept in Danish society is the idea of *hygge*, which loosely translates to a sense of being cozy. Having a comfortable home and enjoying a good meal with friends are both examples of *hygge*.

In addition to spending time at home, Danes also enjoy being physically active in their leisure time. In Denmark, it is believed that sports not only encourage physical health but also promote important social ties. Individuals can join more than 14,000 different sports associations. Approximately 2 million Danes are members of these various associations (Ministry of Foreign Affairs 2017c).

Like many countries in the world, the regular use of personal technology is on the rise in Denmark. Accessing the Internet is common in Danish homes, with 80 percent of homes accessing it on a daily basis. Additionally, 2.8 million Danes aged 16–89 participate in social media (Statistics Denmark 2015, 13).

Politics

Structure of the Government

In 1849, Denmark's first constitution laid the groundwork for its current system of government, which is a constitutional monarchy. This means that the constitution and members of Parliament limit the ruling monarch's political power.

Queen Margrethe II (1940–) is the current head of the Danish monarchy, which is the oldest monarchy in Europe. In 1953, the government passed an Act of Succession that allowed women to rule. Margrethe ascended the throne in 1972, making her the first woman to rule Denmark in more than 500 years. Queen Margrethe II is one of the longest-reigning monarchs in Danish history. She is well-loved by the people and known for making the royal family more accessible to the public.

The Danish Parliament is called the *Folketing*, which is made up of one chamber with 179 members. Elections are held every four years, and citizens vote directly for the members of the *Folketing*. Denmark's voting age is 18 and it has one of the highest voter turnouts in Europe (Statistics Denmark 2014, 21).

Women in Greenland and the Faroe Islands

The Kingdom of Denmark includes Greenland and the Faroe Islands. Greenland is the largest island in the world and is connected to continental North America. The Faroe Islands are composed of 18 small islands located in the North Atlantic. Both countries have autonomous self-rule, each with their own parliament and two additional seats in the Danish *Folketing*.

Like Denmark, Greenland and the Faroe Islands have made gender equality a priority. Greenland has a minister for education, church, culture, and gender equality and a Council of Gender Equality (*Naligi-issitaanissamut Siunnersuisoqatigiit*). In the Faroe Islands, the *Javnstøðunevndin* and *Demokratia* committees work to promote gender equality. Greenland and Denmark have both adopted gender mainstreaming as part of their approach to creating new policy.

The Danish political system is a multiparty system. If a party wins 2 percent or more of the vote, it gets a seat in the *Folketing*. Currently, there are 13 different parties represented in Parliament (Folketinget 2015). It is common for many different parties to join together to make a majority. Members of the majority elect a prime minister. The first female prime minister of Denmark was Helle Thorning-Schmidt (1966–), who was elected in 2011 and held office until 2015.

Denmark is a member of various international organizations, such as the European Union, the United Nations, the Organisation for Economic Co-Operation and Development (OECD), the World Health Organization (WHO), and the World Trade Organization (WTO).

Suffrage and Women's Movements

In 1848, Danish men gained the right to vote, but it was not until 1915 that Danish women gained the same right. Fredrik Bajer (1837–1922) and his wife, Matilde Bajer (1840–1934), were champions of the cause. They also founded the first women's rights organization in Denmark, the Danish Women's Society (*Dansk Kvindesamfund*), in 1871.

In 1924, Nina Bang (1866–1928) became the first woman to be appointed as a government minister in Denmark

and in the world. Despite gains such as this, women held few political offices during the first postsuffrage decades. Women occupied less than 10 percent of political offices until the 1950s (Blomqvist 2006b). In the 1970s, Denmark, along with other Nordic countries, passed gender quotas to help raise the number of women in Parliament. These quotas were extremely successful and account for the high representation of women in Nordic politics today. Denmark has since done away with its quotas.

In the 1970s, a resurgence of the women's movement occurred, known as second-wave feminism. The Red Stockings (*Rødstrømpebevægelsen*) formed during this time. Members of this new group were mainly well-educated women from the middle class. The Red Stockings helped reinvigorate the women's movement and pushed for many successful social changes. The Red Stockings disbanded in the late 1970s, but the second-wave movement lasted through the 1980s.

Participation in Government

Women in Denmark and other Nordic countries have among the highest rates of women participating in politics in the world. Danish women are very active in party membership and turn out in large numbers to vote. As of 2016, 37 percent of Danish Parliament members were women (World Bank 2016). However, one area of politics where women are less active is local politics. Only 10 percent of mayors are women, and women are represented in fewer than 33 percent of local offices (Christensen n.d.).

Politics and Gender

During the 20th century, the Danish government took steps to promote gender equality through various initiatives. In 1965, the Danish Commission on the Status of Women was formed. This group gathered information and published various reports related to women's issues over the course of seven years. The findings of this commission led to the establishment of the Equal Status Council (*Ligestillingsrådet*) in 1975.

In 1995, after the UN Beijing Summit on Women, Denmark began to implement other strategies for promoting gender equality. The first minister of gender equality, Jytte Andersen (1942–), was appointed in 1999. In 2000, the Equal Status Law was passed, which replaced the Equal Status Council with a Ministry of Gender Equality. The concept of gender mainstreaming was also introduced into Danish politics and has played a central role in Danish

gender equality policy ever since. Gender mainstreaming means that gender must be taken into account when writing policy for all areas of society.

In 2009, the Danish Board of Equal Treatment (*Ligebehandlingsnævnet*) was created to handle complaints about discrimination, including gender discrimination. In 2014, the Ministry of Gender Equality evolved into the Ministry of Children, Gender Equality, Integration, and Social Affairs.

Denmark has also been a member of the Nordic Council of Ministers for Gender Equality (MR-JÄM) since 1974. This group meets once a year to discuss the vision, goals, and action plans for gender equality in Nordic countries. Some of the issues this group has focused on include men and gender equality, violence against women, and gender and youth issues.

LGBT Rights

Denmark decriminalized homosexuality in 1933; however, individuals in the gay and lesbian communities were still victims of discrimination during the following decades. In 1948, Axel Axgil, born Axel Lundahl Madsen (1915–2011), created the first support group for homosexuals called Circle of 1948. Over the decades, this group has evolved into what is known today as the Danish National Organization for Gay Men, Lesbians, Bisexuals, and Transgender persons.

One of the major victories for the movement was the recognition of same-sex partnerships. In 1989, Denmark became the first country in the world to recognize these unions. Axel Axgil and his partner, Eigil Axil, born Eigil Eskildsen (1922–1995), were the first couple to be joined in a partnership. While Denmark was an early adopter of same-sex partnerships, it took more than 20 years for Denmark to recognize same-sex marriage, which became legal in 2012.

Denmark also has ties to pioneers in transgender history. One of the first known individuals to undergo sex-reassignment surgery was from Denmark. Lili Elbe, born Einar Wegener (1882–1931), traveled to Germany in 1930 to undergo a series of new procedures to physically transition. Unfortunately, Elbe died the next year of complications from one of her surgeries. In 1952, an American of Danish descent named Christine Jorgensen, born George Jorgensen (1926–1989), made headlines after traveling to Copenhagen to undergo hormone therapy and sex-reassignment surgery. She then returned to the United States where she became an entertainer and transgender advocate.

Armed Forces

In 1962, Denmark passed a law that allowed women to serve in the Danish Armed Forces, though women did not begin serving until 1971. When the law was first passed, it did not allow women to serve in positions that would put them in combat units. In 1988, the law was changed, and women can now serve in combat positions. Today, women make up 5 percent of the Danish military (Blomqvist 2006c).

Religious and Cultural Roles

Religion

The majority of Danes (73%) belong to the Evangelical Lutheran Church in Denmark (*Den Dansk Folkekirke*), also known as the Church of Denmark. However, church membership has declined by 9 percent over the past 10 years, and only 3 percent of Danes attend church regularly (Statistics Denmark 2014a, 6; Manchin 2004). Women have been able to become ordained priests in the Church of Denmark since 1947, and the first female bishop was elected in 1995.

Among the rest of the population, 13 percent of Danes have no formal religious affiliation, and 4 percent are Muslim (Ministry of Foreign Affairs 2017c). Additionally, there are about 8,000 Jews who reside in Denmark (U.S. Department of State 2013, 13).

Immigrants

Historically, Denmark has been a very homogenous country; however, in recent decades, this has begun to change. Immigrants and their descendants now make up 11 percent of the Danish population (Statistics Denmark 2014, 13). One of the fastest-growing groups of immigrants is people from Muslim countries in Africa and the Middle East. This influx of Islamic immigrants began in the 1960s. Since then, the Danish government has implemented very strict immigration policies. While these policies limited the number of new workers who could come to Denmark, these laws did not restrict families from coming to Denmark to reunite with relatives already working in the country. Denmark has also accepted many political asylum seekers from various Muslim countries, including Somalia, Bosnia, Iran, and Iraq. As of 2013, 4,263 refugees were living in Denmark (CIA 2017).

While Denmark does have antidiscrimination laws, xenophobia and discrimination toward Muslims remains

a problem. Some Danes feel that Islam is a threat to traditional Danish culture and values. Tensions came to a head in 2005 when the Danish newspaper *Jyllands-Posten* published cartoons depicting the prophet Muhammad. Many members of the Muslim community found these cartoons to be incredibly offensive and felt they were Islamophobic and blasphemous. Eventually, the situation escalated to an international level and as a result protests erupted throughout the Middle East. The situation did not de-escalate until the following year.

In Denmark, like other countries in Europe, there have been proposals to ban the hijab. These laws have not been passed, though the courts have decided that judges cannot wear any religiously affiliated clothing, including the hijab.

Issues

Violence against Women

Partner-related violence in Denmark has decreased in recent years; however approximately 70,000 Danish women still experience violence at the hands of their partner each year, and it is believed that 32,000 of those women experience extreme violence. Women aged 16–29 are the most likely to become victims of this violence. Most women do not report these attacks to the police. On average, 5,500 women make a report, with less than half taking refuge in women's shelters. There are 45 women's shelters in Denmark, and the majority of women who request shelter for themselves and their children are able to obtain space (Helweg-Larsen and Kruse 2008 12, 20).

Since the early 2000s, the Danish government has made addressing violence against women a top priority. The issue is now classified as a public health concern. In 2002, the government instituted a national action plan on violence against women. This plan also addressed the unique needs of immigrant women, children, and disabled women who had been victims of violence. Part of the 2002 action plan and subsequent action plans is raising public awareness through national campaigns about domestic violence.

Sexual Assault and Rape

Around 500 rapes are reported to the Danish police annually. However, according to a report from Amnesty International, it is likely that between 2,000–10,000 rapes actually occur each year (Amnesty International 2008, 15, 21). For those victims who wish to report their assault, there are 24-hour centers where they can receive aid. These centers

provide medical treatment, staff to assist with collecting DNA evidence, psychological help, and a safe place to stay the night if necessary. Denmark's rate of prosecuting accused rapists is very low and of the assaults that are reported to police, only one in five cases results in a conviction. Various factors account for this low rate, including a narrow legal definition of rape and stereotypes about gender and sexuality.

Female Criminals

Men commit the majority of violent crimes in Denmark; however, the number of women who commit violent crimes has grown quickly in recent years, especially for women ages 15–19. As of 2016, 4.4 percent of prisoners in Danish facilities were women (International Centre for Prison Studies 2016.).

Sex Work and Sex Trafficking

Denmark decriminalized sex work in 1999. While it is legal for Danish citizens to work in the sex industry, it is illegal for noncitizens to do so. This law was originally intended to help curb sex work in Denmark; however, the Danish sex industry has continued to grow.

Many of the women who work in the sex industry are victims of human trafficking. Denmark is what is known as a receiver country, meaning that victims are sent from other countries to work there. The majority of individuals who are trafficked to Denmark are young women from places such as Thailand, the Philippines, Central and South America, Central and Eastern Europe, and Nigeria.

To address this growing issue, new legislation on human trafficking was added to Denmark's Penal Code in 2002 and the National Centre against Trafficking (*Center Mod Menneskehandel*) was established in 2007. This group works to raise awareness about human trafficking in Denmark. It also seeks to ensure that victims of trafficking have access to shelters, legal advice, and counseling. Additionally, Denmark is a member of the Nordic Council of Ministers, which is working to address the problem of human trafficking as well.

E

Estonia

Overview of Country

The Republic of Estonia is located within the north-western area of the Eastern European Plain. Estonia was forcibly made a member of the Union of Soviet Socialist Republics (USSR) during World War II (CIA 2016). However, after the collapse of the Soviet Union in 1991, Estonia began transitioning into a multiparty democracy with a free-market economy. In July 1992, Estonia adopted a constitution, which was later revised in 2003. The constitution declares Estonia a democratic nation in which the government and people are governed by the rule of law.

The national assembly, which is called Riigikogu, is composed of 101 members who are elected for four-year terms. Moreover, the Riigikogu determines the Estonian president, who is elected for a five-year term and is considered the head of state. Additionally, Estonia is a parliamentary republic. In terms of international memberships and involvements, Estonia is a member of the United Nations (UN), the North Atlantic Treaty Organization (NATO), the European Union (EU), and the Organisation for Economic Co-Operation and Development (OECD). In 2011, the euro, the currency of the European Union, was adopted as the official currency in Estonia (CIA 2016). When compared to some of the newer Eastern European EU members,

Estonia has been able to achieve greater economic success (BBC 2016; CIA 2016).

Estonia is situated between the Baltic Sea and the Gulf of Finland and is bordered by Latvia and Russia. Estonia is also one of the few Baltic countries with a well-established island culture because it is home to more than 2,000 islands. While most of these islands are uninhabited, a number of the islands contain Viking, traditional, and medieval cultures (Visitestonia.com 2016). The Central Intelligence Agency (CIA) estimates that Estonia is approximately twice the size of New Jersey, at 17,462 square miles (45,228 sq. km). It is ranked as the 133rd-largest country (out of 257) in the world, falling between the Dominican Republic (132) and Denmark (134) (CIA 2016).

Estonia is divided into 15 administrative divisions, and the capital city is Tallinn, which is located in northwest Estonia on the Gulf of Finland (CIA 2016). While 68.7 percent of the population self-identifies as Estonian, an additional 24.8 percent identify as Russian, 1.7 percent as Ukrainian, 1 percent as Belarusian, 0.6 percent as Finn, 1.6 percent as other, and 1.6 percent as unspecified (CIA 2016). Minority groups in Estonia include Russian, Ukrainian, and Belarusian. Additionally, 68.5 percent of the population reported their primary language to be Estonian, which is the official language of the country (CIA 2016). In 2015, Estonia had a total population of 1,265,420 (CIA 2016). During 2013, 68 percent of the population resided in urban areas (WHO 2015). When Estonia's average annual population growth

rate was compared to other countries, Estonia was ranked 224th out of the 233 countries surveyed (CIA 2016). This ranking indicates that, relative to other countries, the Estonian population is declining at a faster rate than many of the other countries examined.

In terms of weather, Estonia has a temperate climate. The country is located in a transition zone between maritime and continental climates. The country experiences wet moderate winters as well as cool summers. Moreover, 52.1 percent of the land is designated as forest, and 22.2 percent is utilized for agricultural purposes. Estonia has more than 1,400 natural as well as man-made lakes (CIA 2016; Visitestonia.com 2016). Due to Estonia's high latitude, the country has "white nights" in which the country experiences 19 hours of sunlight in the summer months (Visitestonia.com 2016). Oil shale, peat, rare earth elements, phosphorite, clay, limestone, sand, dolomite, arable land, and sea mud are the most abundant types of natural resources available in Estonia (CIA 2016). Given the terrain and typical climate in Estonia, the country sometimes experiences flooding during the spring season. One environmental issue that Estonia is facing is air pollution because of oil shale-burning power plants located in the northeast, which produce sulfur dioxide. The concentration of pollutants emitted into the air, however, has decreased significantly. In addition, there is evidence of coastal seawater pollution in certain areas (CIA 2016).

Gender Inequality

Gender inequality is a worldwide issue and is a considerable obstacle for healthy development. Irrespective of the fact that there have been international gains in gender equality since the 1990s, there is still progress to be attained (UNDP 2015). The UN *Human Development Report* proposed a multidimensional Gender Inequality Index (GII) to examine gender inequalities on a more granular level. In particular, the index examines three crucial aspects of human development: reproductive health, empowerment, and economic status. The primary purposes of the GII are to highlight the human development consequences of gender inequality and to foster global, regional, and national policy discussions. In considering gender equality in Estonia, the country received an overall GII of 0.164 and was ranked 30th out of the 155 countries surveyed in 2014. GII values range between 0 and 1, with higher values signifying heightened levels of gender inequality. As a point of comparison, the United States had a GII of 0.28.

In reviewing the three indexes of the GII, the *Human Development Report* indicates that, in assessing reproductive health, the maternal mortality rate in Estonia was 11 deaths per 100,000 live births. Furthermore, the adolescent birth rate was 16.8 births per 1,000 women between the ages of 15 and 19 years. The empowerment measure examined the proportion of parliamentary seats filled by women as well as the overall proportion of 25-year-old females and males with at least some secondary education. In total, 9.8 percent of parliamentary seats were occupied by females, and 100 percent of men and women over the age of 25 had at least some secondary education. In terms of economic status, 56.2 percent of Estonian females 15 years of age and older participated in the labor force, while 68.9 percent of males of a comparable age were similarly employed. The *Human Development Report* provides a comprehensive overview of gender inequality; however, it is important to note that the GII does not assess history and duration of gender-related disparities (UNDP 2015).

Gender Equity

Social Watch, an international network devoted to poverty eradication and gender justice, created the Gender Equity Index (GEI) to highlight and track the progression of gender inequalities in different countries across the globe (Social Watch 2012). The index assesses the overall gap between women and men in the key areas of education, the economy, and political empowerment. Scores range from 0 to 100, with scores of 100 indicating perfect gender equality. In 2012, Estonia received an index score of 99 in education, 80 in economic activity, and 53 in women empowerment. These scores suggest that men and women have nearly equal opportunity in academic enrollment and literacy. However, there is still a considerable gender gap in highly qualified jobs, parliament, and senior executive positions. Estonia's scores across these three dimensions were averaged to create a final GEI ranking of 77. As a point of comparison, the United States received an overall GEI ranking of 72 by Social Watch.

Girls and Teens

While the median age of Estonia's citizens is 42.1 years, 15.09 percent of the population (male 103,855 and female 98,478) were 14 years of age or under, and nearly 10 percent of the population (male 63,840 and female 59,452) fell within the age range of 15–24 years (CIA 2016). There

were 3.84 infant deaths per 1,000 live births in 2015. When Estonia's infant mortality rate was compared to that of other countries, Estonia was ranked 195th out of the 224 countries surveyed. This rating demonstrates that Estonia had a lower mortality rate than approximately 87 percent of the countries examined (CIA 2016).

Estonia has made a concerted effort to consider the rights of children when developing and enacting national strategies and legislation (Humanium 2012). Specifically, since Estonia's entry into the European Union, the country has made notable progress in the areas of children's health care and education. For example, the government created the Institution of the Ombudsman for Children in 2011 to encourage children's participation in various legislative decisions (European Union 2015). Also, a youth forum, 101 Children to Toompea, is conducted by the Estonian Parliament. This event provides children the opportunity to express their views as well as take part in various activities related to decision-making processes (European Union 2015).

The European economic crisis in the early 2000s exacerbated several issues related to the well-being of children. Approximately one in five children fall below the poverty line, which contributed to a rise in child malnourishment (Humanium 2012). The worsening of economic conditions caused a corresponding increase in children's vulnerability to trafficking, prostitution, and sexual tourism. Since the Baltic States continue to have greater economic difficulties than the European Union, the increase of sexual tourism has been particularly evident in these areas.

Health, Education, and Literacy

UNICEF estimated the under-5 mortality rate (U5MR) in Estonia to be 4 deaths for every 1,000 live births in 2012. The U5MR reflects the likelihood of dying between birth and 5 years of age. When the U5MR is assessed by gender, the rate for females in 2012 was estimated to be 3 deaths for every 1,000 live births as compared to 4 male deaths. In contrast to the 2012 U5MR, the U5MR in 2000 was estimated to be 11 out of 1,000 births, and the 1990 U5MR was reported to be 20 out of 1,000 births. Additionally, UNICEF reported the life expectancy at birth in 2012 to be 74.3 years of age. These figures suggest improving medical care for children under the age of 5. Moreover, from 2008 to 2012, the youth (15–24 years) literacy rate was 99.8 percent for females and 99.7 percent for males. The net enrollment ratio for female school participation was 97 percent

in the primary grades and 92.8 percent for secondary school participation from 2008 to 2012 (UNICEF 2013).

Education

In 2011, Estonia utilized 5.2 percent of the gross domestic product (GDP) on educational expenditures (CIA 2016). When the country's educational expenditures were compared to other countries, Estonia was ranked 54th out of the 173 countries surveyed. This ranking falls between Slovenia and Senegal (CIA 2016) and indicates that roughly 32 percent of the surveyed countries used a higher percentage of the GDP on educational expenditures. In 2012, the school life expectancy (primary to secondary education) was 17 years of age for females and 16 years of age for males (CIA 2016), which suggests education is equally accessible for both genders from primary through secondary education.

In the determination of subjects taught in school, a 2015 Eurobarometer survey, commissioned by the Directorate-General for Justice and Consumers, indicated that 84 percent of the Estonians surveyed believe that ethnic origin should be included in school lessons and materials (Eurobarometer 2015, 101). Furthermore, when considering the inclusion of other diversity-related information in school lessons, religion (82%), sexual orientation (65%), and gender identity (59%) were the top answers for what should be incorporated in educational materials and discussions (Eurobarometer 2015, 101). Estonia's language laws mandate that a maximum of 40 percent of all coursework in publicly funded secondary schools can be taught in Russian. It has been argued that this mandate is harmful where Russian is the predominant language of the region (HRW 2015). The Human Rights Watch (HRW) highlighted teachers' concerns that some Russian students' mastery of the Estonian language did not allow them to effectively learn core subjects, such as world history (HRW 2015).

Health

Estonia enacted an insurance-based public health system in 1992 (European Observatory on Healthcare Systems, 2000). In 2013, 5.7 percent of the GDP was utilized by the Estonian government for health-related purposes. The OECD (2015) indicated that the Estonian life expectancy at birth was 73.2 years. However, the life expectancy has been considerably affected by the high mortality rates

from cardiovascular disease, especially among males. The overall mortality from cardiovascular diseases was 542.5 per 100,000 Estonians (OECD 2014). However, this is a significant decline from 2000, in which the mortality rate from cardiovascular diseases was 815.7 per 100,000 Estonians. Moreover, according to the OECD, Estonia has a notable gender gap in life expectancy, with women living nearly 10 years longer than men on average (OECD 2014). When examining nutrition, physical activity, and obesity in Estonia, the WHO (2014) reported that 20.4 percent of females were obese as compared to 20.9 percent of males in 2008.

Access to Health Care

In 2012, there were 3.24 physicians for every 1,000 Estonians (CIA 2016), and there were 5.3 hospital beds available for every 1,000 Estonians in 2011 (CIA 2016). The pharmaceutical expenditure per capita in 2012 was USD\$311 (PPP), and the health expenditures per capita was USD\$1447 (PPP) (OECD 2014). As a point of comparison, in 2000, the pharmaceutical expenditure per capita was USD\$114 and the health expenditures per capita was USD\$513 (OECD 2014).

Maternal Health

In 2013, 99.4 percent of births in Estonia were attended by a skilled health professional. Furthermore, in 2015, there were 9 maternal deaths per 100,000 live births (CIA 2016). When Estonia's maternal mortality rate was compared globally, Estonia was ranked 184th out of the 184 countries surveyed (CIA 2016). This rating shows that Estonia's maternal mortality rate was very low compared to other countries. In addition, UNICEF calculated the total fertility rate in 2012 to be 1.6 births. The rate estimates the number of children delivered by each Estonian woman if she were to survive until the end of her childbearing years. The use of modern contraception has become widespread in Estonia.

Infectious Diseases

The World Health Organization (WHO) defines HIV as a "retrovirus that infects cells of the immune system, destroying or impairing their function" (WHO 2016a). The most advanced stage of HIV is AIDS. HIV can be transmitted through unprotected sexual transmission (vaginal or anal), transfusing infected blood, using nonsterile

injection equipment, breastfeeding, or from mother-to-child in utero (WHO 2016a). The first reported case of HIV in Estonia was in 1988. Approximately four years later, the first AIDS case was recorded in Estonia (WHO 2016a). In 2013, the prevalence rate of people living with HIV/AIDS was 1.3 percent (8,600 Estonians). When Estonia's HIV/AIDS adult prevalence rate (aged 15–49) was compared globally, Estonia was ranked 99th out of the 127 countries examined (CIA 2016). Lower rankings indicate increased numbers of individuals living with HIV/AIDS. In the WHO's *HIV Epidemic in Estonia: Analysis of Strategic Information* report, there was a significant decrease in newly diagnosed HIV cases among young people. The report attributed Estonia's increased HIV/AIDS prevention and intervention efforts over the past decade to the decline in new cases (WHO 2011).

Substance Use

In 2010, the WHO reported a 10.2 percent prevalence rate of alcohol use disorders among Estonian men and women. However, males were disproportionately impacted, with a prevalence rate of 18.6 percent. By contrast, females experienced a 3.2 percent prevalence of alcohol use disorders (WHO 2014). The OECD (2014) reported that Estonians consumed an average of 12.3 liters of alcohol per adult in 2012. This level of consumption was considerably higher than in many of the other countries examined. Additionally, in 2012, 26 percent of Estonians reported to be daily smokers (OECD 2014).

Reproductive Rights and Abortion

For the most part, the abortion rights in Estonia have mirrored the laws regarding abortion in Russia. The laws in Russia have evolved from a very restrictive and punitive approach to abortion into a system that incorporates a higher degree of women's rights and choices. A Soviet decree in 1936 denied abortion services except in situations in which there was a danger to life, serious threat to maternal well-being, or a grave disease that could be inherited from the parents (United Nations). All abortions had to be obtained in a hospital or maternity home. A failure to observe any of these conditions by a physician or mother could result in imprisonment or fines. In 1987, the Russian government issued another decree that outlined a broader range of circumstances in which a woman could request abortion services, including the death of a husband, imprisonment of the pregnant mother or father,

divorce during pregnancy, and the presence of a child with disabilities in the family, among others (United Nations). The decree established that women could obtain an abortion through the 28th week of pregnancy if any of these conditions were met.

Since gaining independence from Russia, Estonia has made several changes to the legality of abortion services. For instance, the Estonian government issued a decree shortening the period of time in which abortion can be legally obtained from 28 to 20 weeks of pregnancy as well as dictating that a woman must confer with a doctor before an abortion and that a woman must pay a larger portion of the expense of the procedure if it is obtained for nonmedical reasons (United Nations).

Employment

Since the fall of the Soviet Union, Estonia has achieved relative success in transitioning from a state-run market to a modern market economy. While unemployment was, essentially, not present in socialist economies, after a move to a free-market economy, unemployment became a reality. Most recently, the unemployment rate has been steadily declining from 2010, when the rate was 16.9 percent, to a rate of 6.2 percent in 2015 (CIA 2016).

In 2015, the labor force was estimated to consist of 669,400 individuals (CIA 2016). When the labor force was examined by occupation, 67.7 percent of the labor force worked in service-related occupations, 28.4 percent in industry, and 3.9 percent in agriculture (CIA 2016). The labor force participation among adult females was 56.2 percent in 2013. By contrast, the participation rate was 68.9 percent among adult males.

In addition, language has become essential to being employed in the public and private sectors. The Estonian Language Inspectorate is tasked with enforcing Estonia's language laws. Specifically, the inspectorate determines whether public employees can speak Estonian with a specific level of fluency (HRW 2015). Private employees who interact with the public, such as pharmacists, are also held to these language standards. The inspectorate conducted 2,540 inspections throughout Estonia in 2013. Of these inspections, 2,261 were determined by the inspectorate to have insufficient knowledge of the Estonian language (HRW 2015).

The European Commission against Racism and Tolerance alleged that the inspectorate frequently does not take into consideration regional differences when enforcing the

country's language laws (HRW 2015). The Ida-Viru region, for instance, has a large concentration of Russian speakers, which would make it difficult, at times, to maintain these language standards. In 2013, the inspectorate carried out inspections of 1,694 teachers in schools with primarily Russian-speaking students. The inspectorate found 89 percent of the teachers were in violation of Estonia's language laws (HRW 2015). Ultimately, individuals who do not meet the requisite language laws can face fines or even dismissal.

Human rights groups have argued that employers can cite these language requirements as a means to discriminate against hiring Russian speakers (HRW 2015). Despite the fact that actions by the inspectorate can be legally challenged, a challenge can result in significant time and financial strain for the individuals who are filing the complaints. Moreover, a number of Estonian minority groups, such as Russians, Ukrainians, and Belarusians, have been negatively impacted by Estonia's language-proficiency requirements in the workplace (MRGI 2016). In particular, these minority groups are poorly represented in the upper levels of public-sector positions. This trend is particularly evident for young adult women (MRGI 2016).

Women in the Economy

In 2013, the total employment rate for females was considered one of the highest in Europe. In fact, Estonia's female employment rate is significantly above the EU average (CIA 2016). However, while part-time work is not common in Estonia, in 2013, 14.2 percent women worked part-time as compared to 6.2 percent of men. However, there is a notable gender pay gap between Estonian men and women, which is nearly double the EU average (CIA 2016). The total gender pay gap was 29.9 percent in 2013. However, the gender pay gap was considerably higher in the financial activities sector. While Estonian women comprise 77 percent of the labor force in this area, the total gender pay gap is 44.9 percent. The majority of the highest-paying jobs in this sector are occupied by men (CIA 2016).

Questionnaires by Eurobarometer (2015) indicated that 36 percent of those surveyed believed that enough was being done to promote gender diversity in the workplace. In addition, 37 percent of respondents reported that sufficient effort was being done to foster diversity in terms of ethnic origins in the workplace. Only a quarter of the participants stated that enough was being done by the workplace in terms of promoting religious diversity

(Eurobarometer 2015). The Estonian government has made an effort to reduce the gender pay gap, and the Estonian Association of Business and Professional Women has led the Equal Pay Day campaign since 2010. The goal of this campaign is to foster awareness and promote public discussions regarding the gender pay gap. Likewise, Estonia enacted the Action Plan for the Reduction of Gender Pay Gap initiative in 2012 (Eurobarometer 2015).

Family Life

The political and economic changes exhibited in Central and Eastern Europe during the late 1980s and early 1990s resulted in subsequent transformations in attitudes toward marriage, cohabitation, and childbearing (Thorton and Philipov 2009, 125). Similar to many countries, such as Bulgaria, Russia, and Romania, survey records show that, in Estonia, there was an increase in nonmarital cohabitation as well as a corresponding decrease in the percentage of cohabitations that resulted in marriage. Furthermore, in 1990, 98 percent of Estonians surveyed agreed that children need both a mother and father to grow up happy, 91 percent agreed that women needed children to be fulfilled, 13 percent agreed that marriage was an outdated institution, and, finally, 35 percent approved of a woman's decision to be a single parent. By contrast, in 1999, 95 percent of Estonians surveyed agreed that a child needed both a mother and father to grow up happy, 67 percent indicated that women needed children to be fulfilled, 23 percent agreed that marriage was an outdated institution, and, finally, 35 percent approved of a woman's choice to be a single parent (143).

In 2011, the Estonian mother's average age at the time of her first birth was 26.4 years (CIA 2016). When Estonia's total fertility rate was compared globally, Estonia was ranked 183rd out of the 224 countries surveyed (CIA 2016). This rating shows that Estonia's total fertility rate in 2015 was lower than 81 percent of the countries examined. The total fertility rate in 2016 was estimated to be 1.6 births (CIA 2016). The rate estimates the number of children that would be delivered by each Estonian woman if she were to survive until the end of her child-bearing years.

Familial Economy

Both parents are provided the opportunity to take maternal or paternal leave from work to stay home and take care of newborn children. Estonians are legally permitted a 20-week maternity leave, which is funded through health

insurance contributions (Population Europe Resource Finder and Archive 2014). Maternity leave can last as long as 140 days, and it reimburses 100 percent of a mother's earnings with no monetary cap. In general, women are allowed to start their maternity leave 30–70 days prior to the birth of a child. Furthermore, Estonian law allows a 10-day paternity leave, which is funded through general taxation. During this time, fathers are entitled to 100 percent of their earnings, with a total possible payment of three times the average salary in Estonia (Population Europe Resource Finder and Archive 2014).

Marriage and LGBT Rights

The rights of lesbian, gay, bisexual, and transgender (LGBT) individuals have been an emerging issue for many postsocialist countries in Central and Eastern Europe. Prior to Estonian independence, discussions surrounding gender preference and identification were not permitted and, consequently, were not addressed during the communist era (Koldinska 2009). A 2015 Eurobarometer poll indicated that 40 percent of Estonians surveyed approved of same-sex relationships, and 44 percent of the participants reported that LGB individuals should have the same legal rights as heterosexual Estonians. Furthermore, the findings from the Eurobarometer poll indicated that 59 percent of the surveyed Estonians endorsed the inclusion of discussions surrounding gender identity in school lessons (Eurobarometer 2015).

Estonia has demonstrated considerable progress with respect to LGBT rights. In a 51–1 vote, the Estonian Parliament passed a law in 2001 to equalize its age of consent laws (O'Bryan 2001). The enactment of this bill removed the previous age-of-consent laws, which many argued discriminated against LGBT individuals. The earlier 1992 age-of-consent law determined the minimum legal age of heterosexual consent to be 14 years of age and the minimum age of same-sex sexual consent to be 16 years of age (O'Bryan 2001).

A Draft Civil Partnership Act was submitted to the Riigikogu in April 2014, and Estonia became the first former Soviet state to legally recognize same-sex marriage or same-sex partnerships when they passed the Co-Habitation Act later that year (McDonald-Gibson 2014). This law ultimately guarantees that registered unmarried couples, irrespective of their sexual orientation, will receive the same property and inheritance benefits as other married couples. In addition, the bill also enables one partner

to adopt the other partner's children. To access these rights, unmarried couples must legally register their partnerships. While the bill was supposed to go into effect on January 1, 2016, various LGBT groups have criticized the government for limiting the positive impact of the bill by inadequately preparing for its implementation (HRW 2014).

Intimate Partner Violence

Violence against women is a significant public health and human rights issue. Intimate partner violence (IPV) is a common type of violence against women. IPV is defined as a behavior initiated by an intimate partner or former partner that results in physical, sexual, or mental harm, which includes, but is not limited to, physical aggression, emotional abuse, sexual coercion, and controlling behaviors. These types of behaviors often impact women's physical, psychological, sexual, and reproductive health (WHO 2016b). Similar to other Eastern European countries, Estonia has only recently begun recognizing violence against women and, more specifically, IPV.

Due to a dearth of research data and lack of careful and consistent violence screenings in the Estonian health care arena, there is a paucity of reliable crime statistics on IPV victims. In fact, the first violence-related survey in the country's history was administered to 535 Estonian women in 2001 (Laanpere et al. 2012). The results indicate that one-fifth of the women surveyed (aged 15–74 years) had witnessed or experienced violence by an intimate partner within the past year. A study conducted by Laanpere and colleagues in 2012 furnished the first population-based data on women's exposure to IPV in Estonia. The study surveyed Estonian women from the ages of 16 to 44 years. The results indicated that 18.4 percent of the sample endorsed being exposed to physical or sexual IPV (Laanpere et al. 2012). However, the majority of funding utilized to address this issue is devoted to victim support initiatives rather than the development of legislative instruments (Laanpere et al. 2012).

Politics

The fall of the Berlin Wall led to myriad new topics, such as free-market ideologies and global expansion, which entered into the social, political, and cultural conversations within Estonia. The influx of these ideas along with a united desire to break away from Russian dictates led to a unique process of determining Estonia's national identity (Marling 2010). While it might be a common belief that

Estonia immediately changed its laws, policy, and culture following Soviet independence, Marling (2010) notes that, in actuality, Western ideologies were gradually altered and adapted in correspondence with local situations, beliefs, and values.

In regard to women's involvement in the political process, Estonia has a comparatively high number of women involved in their political parties. Notwithstanding women's participation in political parties, there is still an underrepresentation of women in leadership positions. Women were a mere 11 of the 101 members of parliament in 1998. However, in 2008, the number of women members of parliament increased to 21. By 2015, 24 seats were occupied by women. When compared to other countries, Estonia ranked 69th of the 191 assessed with regard to the percentage of women in leadership positions. This ranking falls between Equatorial Guinea (68th) and China (70th).

In 2015, the Estonian Language Inspectorate conducted investigations in Tallinn of the Centrists' Party's election posters, which featured both the Russian and Estonian languages (HRW 2015). The inspectorate indicated that the posters did not comply with the language law because the Estonian language was less evident than the Russian language. Some political activists viewed this assessment as politically motivated harassment, as the font and text remained the same, even though the Russian text preceded the Estonian writing (HRW 2015).

Religious and Cultural Roles

In 2012, there were more than 500 registered religious associations in Estonia. Freedom of religion in Estonia is protected by the Estonian Constitution, local laws, and public policies. While the Lutheran Church is the most prevalent religious denomination in the country, only 13 percent of the population report being affiliated with the church. Recent statistics suggest that 96 percent of the surveyed respondents in Estonia identify as Christian, with 60 percent of the individuals further stating that they are not affiliated with a specific denomination or church. In addition to the individuals who report an affiliation with the Lutheran Church, approximately 15 percent of Estonians associated with one of two Orthodox churches: the Estonian Orthodox Church or the Estonian Apostolic Orthodox Church. Moreover, 1.4 percent of the population identifies with other branches of Christianity, such as Methodist, Roman Catholic, Seventh-day Adventist, and Pentecostal. Religious holidays that are recognized by the

Estonian government are Good Friday, Easter Sunday, Pentecost, and Christmas.

In addition to traditional Christian religious holidays, since 2003, Estonia has observed International Holocaust Day on January 27. Estonia is a member country in the International Holocaust Remembrance Alliance (IHRA), an intergovernmental body that includes 30 other countries, such as Argentina, Canada, Latvia, Sweden, and the United States. The primary purpose of the IHRA is to facilitate Holocaust education, awareness, and research on a national and international level (IHRA 2017). Furthermore, teaching about the Holocaust is mandatory in the Estonian school curriculum and is covered in the 5th and 9th grades (IHRA 2017).

Issues

Human Trafficking

In the European Union, Estonia is often cited as one of the predominant source countries of human trafficking. In particular, Estonia is frequently considered a source, transit, and destination country for forced labor and sex trafficking (U.S. Department of State 2015a, 153). The sexual victimization of Estonian women and girls, particularly in rural areas, primarily transpires within Estonia as well as in other European countries, such as Denmark, Finland, Germany, Luxembourg, Norway, Spain, and the United Kingdom. In addition, Estonian men and women have historically been forced into unwanted labor in countries such as Australia, Finland, Norway, Spain, Sweden, and the United Kingdom. Typically, labor exploitations arise in the construction, cleaning, and social welfare sectors. In Estonia, Ukrainian and Polish men are particularly vulnerable to labor exploitation, especially within the construction arena (170).

In 2012, the Estonian government implemented more specific antitrafficking legislation in which the perpetrators of human trafficking could face a maximum of 15 years of imprisonment. With the enactment of antitrafficking legislation, Estonia became the last Balkan nation in the European Union to adopt such laws (Humantrafficking.org 2012). Prior to 2012, Estonia was pressured by the United States to improve its prevention and intervention efforts to remain off the human trafficking watch list. The United States argued that the country's laws did not address human trafficking concerns such as the recruiting, transporting, and exploiting of victims. The absence of human trafficking legislation also enabled perpetrators

to escape with relatively little punishment, such as jail sentences or fines (Humantrafficking.org 2012).

The U.S. Department of State's Trafficking Victims Protection Act (TVPA) offers strategies and tools to reduce trafficking crimes domestically as well as in the international community. Estonia is currently a Tier 2 country because the Estonian government, as of 2015, was not fully complying with minimum guidelines established by TVPA to prevent trafficking. In 2014, the U.S. Department of State recommended that the Estonian government increase their efforts to investigate, prosecute, and convict trafficking offenders. However, the U.S. Department of State also determined that the government of Estonia was making notable efforts to become compliant with TVPA standards. As a result, Estonia was not placed on the Tier 2 Watch List or considered Tier 3. By way of example, the Estonian government notably increased trafficking-related training for law enforcement authorities in 2013. Specifically, training was provided for 100 law enforcement authorities, including police officers, prosecutors, judges, and labor inspectors.

F

Finland

Overview of Country

Finland is the easternmost Scandinavian country and is a member of the European Union. It is bordered by Russia to the east, Norway to the north, and Sweden to the west. The Gulf of Bothnia, a portion of the Baltic Sea, lies between Finland and Sweden. Finland's total area is 130,128 square miles, and 10 percent of the country is covered by lakes—approximately 188,000 of them—hence the moniker “land of a thousand lakes.” Finland's topography is relatively flat, with some low hills, and its postglacial landscape is mostly uncultivated and occupied by forests of firs, birch, and other cold-climate species. The land is rocky and has visible granite outcroppings. In the fens, bogs, and forest floors, wild cloudberries, blueberries, and lingonberries grow in abundance.

As one of the northernmost countries in the world, Finland experiences 24-hour daylight during its short summers—hence, another nickname, “land of the midnight sun”—and nearly constant darkness in the long winter. Aurora Borealis is a regular phenomenon in the winter months. Winter temperatures are often well below 0°C (32°F), while summer temperatures can approach 30°C (86°F). Warmed by the Gulf Stream in the Baltic Sea, Finland's temperatures, while cold, are less so than those of other northern locales, such as northern Canada, Alaska, or Russian Siberia.

Finland's total population at the end of February 2014 was 5,451,270, with 2,770,906 women and 2,680,364 men (Statistics Finland 2014). Much of that population dwells in Helsinki, the nation's capital, which is more than twice as populous the next most populous municipality.

Finland's official languages are Finnish and Swedish, though only approximately 5 percent of the population speaks Swedish. Other languages include the Sami language of Lapland as well as Russian and Karelian. Finnish, whose language family is Uralic, bears a close relationship to Karelian and Estonian and is also related to Hungarian. It is one of very few European languages that does not descend from Indo-European, which is the foundation of most languages in the Western world.

Finland has a history of ancient cultures, but it is a relatively new commonwealth. Having declared independence from Russia in 1917, at the same time that Russia's own revolution was taking place, the first president was elected in 1919 after a period of conflict with Russia and a brief civil war. A parliamentary democracy, Finland has remained a powerfully independent nation within the European Union.

Finnish women's quality of life is notably high. Finland was the first nation in the world to grant suffrage as a constitutional right to women, and women are active in the political sphere and across the spectrum of professions. Finland's Act on Equality between Women and Men, in effect since 1987, aimed to prevent discrimination based

on sex or gender, promote equality between men and women, and improve women's status, particularly in the sphere of professional life. However, women in Finland still earn less than men do. Discrimination based on pregnancy or child care responsibilities has been banned since 1992, and a 1995 amendment promotes gender equality in governance, having established a quota system for councils and official committees, such that representation should not fall below 40 percent for either women or men. In 2000, Tarja Halonen became Finland's first woman president, and she was reelected in 2006, serving for 12 years total. In addition to a woman head of state, Finland also had two women prime ministers in the first decade of the 21st century.

With access to excellent health care and worker benefits, education, job opportunities, and freedom to work outside the home, women have a high standard of living. Finland's culture is generally tolerant of single women, women in same-sex relationships, and transgender women and men. Discrimination based on sexual orientation or gender identity is illegal. Same-sex couples have had the right to enter into registered partnerships, granting many of the same rights as marriage, since 2002, and as of November of 2014, the Finnish Parliament voted to permit same-sex marriage.

Finland is ranked 11th out of 187 nations for its Gender Inequality Index (GII; 0.075) according to the UN Development Programme (UNDP); it is ranked 24th on the Human Development Index (HDI) (UNDP 2014). The World Economic Forum's (WEF) *Global Gender Gap Report 2014* ranks Finland 2nd in the world, with a Gender Gap Index of 0.8453. It has remained a top-ranked nation, alongside Iceland, Norway, and Sweden, for the past several years. Women's life expectancy at birth is 81 years, and men's is 78.9 years. In 2013, the mean age of Finnish women was 43.3 years, compared to men's mean age of 40.5 years (Statistics Finland 2014). In 2013, the maternal mortality rate (MMR) was 4 per 100,000 live births, down from 9 per 100,000 in 2005, and 7 in 2000 (WHO et al. 2013). The under-5 mortality rate in 2013 was 3, and Finland is among the nations with the lowest under-5 mortality rates, ranked at 185th (UNICEF 2013).

Girls and Teens

Girls and young women in Finland experience many of the benefits and freedoms that come with residing in a nation with a high standard of living. They have access to

excellent education and health care as well as cultural programs and national initiatives designed to improve young people's social conditions. Family life tends to be stable for young people, as Finland has one of the lowest child poverty rates in the European Union.

Youth Initiatives

Young women are encouraged to pursue diverse educational and professional avenues. Youth unemployment in Finland has risen recently, however, and in response, Finland's youth policy includes a "Youth Guarantee," which took effect in 2013. It ensures that young people will receive a job, on-the-job training, a study place, or rehabilitation within three months of becoming unemployed. The Finnish government has an active interest in promoting youth learning and culture, as well as youth participation in municipal policy making. At the national level, the Finnish Children's Parliament includes 9- to 13-year-old children appointed by their municipalities. Youth councils within municipalities include 13- to 18-year-olds who participate in dialogues with policy makers and represent youth interests in municipal policy making. In addition, the Finnish Ministry of Education and Culture defines objectives for supporting and improving the environment for Finnish youth in its development program, which is revised every four years. Finland's youth policy is intended to improve young people's living conditions and participation in society.

While equality is emphasized in national culture, a recent study suggests that youths' attitudes toward gender roles express gender bias. A 2012 study suggests that most young men and women in Nordic countries, including Finland, believe in equal rights; yet, in the same study, 65 percent of Finnish male youths believe the husband is the head of the household (Eriksen 2012). On the other hand, Finland's Federation of Green Youth and Students (ViNO) has pressed the Finnish government to recognize the "third gender," individuals who do not identify as either male or female.

Education

In Finland, education is free, publicly supported, and student-focused. From preprimary care and education through tertiary (postsecondary) education, Finnish citizens are encouraged to pursue academic and vocational courses of study to train and prepare for careers in a vast spectrum of fields. Practically all Finns take advantage of

the preprimary care and education offered, and while the preschool enrollment for Finnish children is already high, as of January 1, 2015, Finnish students are required by law to have attended preschool prior to enrolling in primary school. Preschool is available at no charge, and students who live further than 5 kilometers from their school may receive free transportation (Ministry of Education and Culture 2015). The preprimary school (preschool) gross enrollment ratio for Finnish girls and teens was 68.8 percent from 2008 to 2012. The primary school (grades K–5) gross enrollment ratio was 98.8 percent and the secondary school gross enrollment ratio was 93.7 percent for females from 2008 to 2012 (UNICEF 2013).

Health

Finland's comprehensive health care system provides free health care for children and adolescents. For children, that care includes not only regular checkups but also thorough medical examinations that involve coordination with the child's day care and others involved in the child's life "to promote the health of the child but also the well-being of the entire family" (European Union 2014).

Sex Education and Teen Pregnancy

Finland's adolescent fertility rate is low compared to Europe and Central Asia. In 2012, the rate was 9.2 per 1,000 young women (15–19 years old) compared to 30.6 in Europe and Central Asia (World Bank 2014). The rate of induced abortion among 15- to 19-year-olds in Finland is also low, at 10.5 abortions per 1,000 women of the same age in 2013 (National Institute for Health and Welfare 2014). This may be attributable to the strong sex education program in the Finnish educational system.

Sex education has been a part of the Finnish secondary school curriculum since 1970, and teens' sexual behavior and knowledge about reproduction and sexuality has been monitored every two years, beginning in 1995, as part of the School Health Promotion Study. Since 2001, sex education has been taught within the framework of health education, is mandatory in school curriculum, and is taught by qualified teachers to students that are 13–15 years old (National Institute for Health and Welfare 2012).

Access to Health Care

Health care for women is a crucial factor in Finland's status as a nation with a high standard of living. Finland is

known for its excellent maternal care—both health care and employment leave benefits. In the *Save the World's Mothers Report 2014*, which evaluates the well-being of both mothers and children, Finland is the top-ranked nation in which to be a mother; Norway and Sweden follow. The ranking is based on indicators that include maternal health, educational status, children's well-being, economic status, and political status, in which Finland ranks quite highly (Save the Children 2014).

Finland adopted the Primary Health Care Act in 1972, which sought to provide equal access to health care to all Finns, regardless of socioeconomic status or geographical location. The act mandated that municipalities provide primary health and medical care services to its residents, leading to the establishment of municipal health centers throughout the country, which provide the bulk of medical services to Finnish citizens. National Health Insurance covers the health care of all Finns, with out-of-pocket fees for which the patient is responsible varying among municipalities. User fees are usually affordable and are assessed on a sliding scale for long-term illnesses. Municipalities, not the central government, determine the specific fees for medical services.

Reproductive and Sexual Health

Finnish women's sexual health is supported through the availability of health care and services, including availability of contraceptives, treatments for sexually transmitted diseases, maternity care, and abortion. The number of induced abortions in Finland is lower than in the other Nordic countries and has decreased steadily since 1980. This is attributed in part to a strong sex education program. Finland's sex education program focuses on avoiding unwanted pregnancy and preventing sexually transmitted diseases, but it also promotes "the development of a positive sexuality" (National Institute for Health and Welfare 2012).

Sex outside of marriage is not taboo in Finland; indeed, more than 50 percent of firstborn children are born outside of marriage. Sex education and the discourse on sexuality—at least for heterosexual individuals and couples—tends to focus on practical and positive concerns rather than moral ones. As already noted and discussed below in "Family Life," Finland's maternity care is comprehensive and provides expecting and new mothers thorough support during and after pregnancy.

Finland's Ministry of Social Affairs and Health introduced the National Action Programme for the Promotion

of Sexual and Reproductive Health, which forwards goals and recommendations to be implemented in a collaborative effort among national as well as municipal and non-government organizations (NGOs). The program intends to address current challenges, including repeat abortions (while the number of induced abortions is low, the number of repeat abortions has increased—more than one in three women who had an abortion in 2013 had previously had at least one abortion); chlamydia infections among young people; and availability of information and services to immigrants, victims of sexual violence, nonheterosexual people, and people with disabilities.

Employment

Women in Finland are employed across all sectors of work. In fact, the *Global Gender Gap Report 2013* shows that women make up the majority of the high-skilled workforce. Statutory mandates ensure that women have equal opportunities in workplaces; however, Finnish women earn less than their male counterparts. Finland has no statutory minimum wage. Recent figures show that about 63 out of 1,000 women have a second job, slightly fewer than men, of whom nearly 69 out of 1,000 take on secondary employment (Eurostat 2015).

In comparison to the EU-27 average, the employment rate for women in the Finnish labor market is higher (68.2% compared to 58.6%). Fewer Finnish women were actively seeking employment in 2013 (7.1%) than were EU-27 women in the same year (10.6%). Finnish women have higher attainment of tertiary (postsecondary) education than women in the EU-27 (38.3% compared to 25.8%). The gender pay gap still exceeds that in the European Union, however (18.2% compared to 16.2%). As with EU women in general, Finnish women tend to study and train in fields more typically “female,” and fewer women work in “male” fields: for example, 79.8 percent of Finnish women pursued teacher training and education science, whereas 19 percent studied engineering, manufacturing, and construction (European Commission 2013).

Family Life

The stability of Finnish family life is a concern of the state government, and comprehensive parental leave and child care systems are in place to help ensure a healthy work-life balance. Both parents receive leave to care for children; maternity leave is roughly 18 weeks, paternity leave

is about 9 weeks, and parental leave (which either parent may use) is about 26 weeks. Together, the leave allotments add up to approximately the first year of a child’s life. During leave, men and women are paid a percentage of their annual salary, and unemployed parents are eligible for financial assistance. Affordable day care, available for all children under 7, with cost based on a sliding scale, enables mothers to return to work full-time; however, a parent who stays home may receive paid child care leave if they choose not to use day care. A parent may stay home with a child under the age of three and retain his or her job (European Union 2014).

Structures are in place, therefore, to enable women to work full-time while also tending to family life. However, including the labor that occurs both inside and outside the home suggests that women are working more than men, according to statistics based on a 2009 study. The difference between men’s and women’s time spent on domestic work (e.g., child care, cleaning, gardening, caring for pets) has narrowed since 2000; however, men do more maintenance work, and women do more housekeeping (OSF 2009).

Leisure time in Finland increased during the first decade of the 21st century, but women have less free time than men. Women watch less TV than men, and they also use computers less. Because of Finland’s extreme climate, types and places of labor change seasonally. Gainful employment occurs most in autumn and least in summer; domestic labor, including home maintenance and gardening, occurs in summer; and leisure time is most commonly spent at home during Finland’s dark, cold winters (OSF 2009).

Marriage and Divorce

In general, marriage in Europe is decreasing, and divorce rates are increasing, which means more children are born to unmarried women. Finland’s marriage rate has seen a nominal increase since 2000, from 5.1 (per 1,000 inhabitants) to 5.3. Divorce rates decreased marginally from 2.7 in 2000 to 2.4 in 2012. As with other European nations, the birth rate outside of marriage has increased substantially over the past 50 years, but it has increased only slightly since 2000, from 39.2 to 41.5 (Eurostat 2014). These figures matter because employment and the amount of time women work (aged between 20 and 49) are closely linked to whether they are parents; this contingency is less obviously the case for men.

The gender difference in risk of poverty in 2013 for men and women under 65 was 6.6 percent—less than

many other EU nations, but still a noticeable gap. For 65 and over, however, the gender difference is -2.8 (Eurostat 2015). Interestingly, the percentage of Finns found to be at risk of poverty in single-person households is greater in households without dependent children than in those with dependent children (Eurostat 2014). This may be due to the universal child allowances and additional subsidy provided to single-parent households.

Politics

Even before it gained national independence, Finland's political structure recognized women's rights. Women in Finland gained the right to vote before women in any other European nation; they were also the first in Europe to be recognized as eligible to hold political office. In 1906, when Finland was still a territory of Russia, the Parliament extended full political rights to women. The following year, 19 women were elected as members of Parliament. Among them were prominent Finnish feminists Lucina Hagman, who helped to establish the Finnish Women's Union in 1907 and was the first chairwoman of the League of Finnish Feminists (Unioni), and Aleksandra Gripenberg, the chair of the Women's Society of Finland and a founding member of the International Alliance of Women.

Finland's 1995 Act on Equality between Women and Men established the nation's continued investment in promoting equality. The act was revised in 2005 and again in 2005 to include EU initiatives into Finnish law. In addition, the Gender Mainstreaming Development Valtava was adopted in 2007 to further mainstream gender equality and increase knowledge of gender-based perspectives, among other aims. The Government Action Plan for Gender Equality 2008–2011 addressed 8 gender-based concerns in 31 measures. Most recently, the Government Action Plan for Gender Equality 2012–2015 included more than 50 measures in areas such as gender equality legislation, work-life balance, promotion of women's careers, preventing violence against women and domestic violence, and more. Finland's Ministry for Social Affairs and Health includes four separate bodies that oversee the implementation of the equality act: the Gender Equality Unit, the Ombudsman for Equality, the Council for Gender Equality, and the Equality Board. In addition, the following NGOs play a strong role in promoting gender equality in Finland: the Coalition of Finnish Women's Associations, the National Council of Women of Finland, the Feminist Association Unioni (*sic*), and the Miessakit Association.

Participation in Government

Women in Finland have one of the highest rates of participation in government compared to other nations around the world. Finland is ranked third, under Nicaragua and Sweden, for percentage of women in ministerial positions (50%, reflecting appointments up to January 1, 2014) (UN Women and IPU 2014). Finland also ranks highly for percentage of women in parliament (42.5%), falling at number eight among nations ranked. The Nordic countries have the highest percentage of women in parliament (42.1%) compared to other regions worldwide; the second-highest percentage is in the Americas, at 25.2 percent, and the world average is 22.2 percent (UN Women and IPU 2014).

Religious and Cultural Roles

Finland's national church is the Evangelical Lutheran Church of Finland, to which more than 78 percent of Finland's population belongs; the Finnish Orthodox Church, an Eastern Orthodox denomination, is the second most popular church in the nation. While many Finns ascribe to the beliefs of the church, Finnish society, like other Nordic societies, tends to be quite secular. Finland condones freedom of religious belief. Within families, parents choose the religion in which they will raise their children; if parents disagree, mothers may choose for children under the age of one.

Women and the Church

Within the Evangelical Lutheran Church, women are visible in church leadership. Irja Askola, the bishop of Helsinki, was consecrated Finland's first female bishop in 2010. Roughly 40 percent of all priests in the Evangelical Lutheran Church are women.

LGBT Marriage and the Church

Finland's measure to allow gay marriage passed in 2014. It was the last of the Nordic countries to adopt gay marriage, and it was a controversial decision, with Parliament very nearly split on the vote. Kari Mäkinen, Finland's archbishop of the Evangelical Lutheran Church, came out in favor of the decision. In response, several thousand Finns withdrew from the church. While gay partnership has been legal since 2002, gay marriage being condoned by the church is still a subject of public debate.

Participation in and Production of Culture

Finns are a culturally engaged people. Among European nations, Finland, along with other Nordic countries, reports the highest rates of people who read more than 12 books per year. With the other Nordic countries, Finland also exhibits the highest rates of people participating in cultural activities, such as going to movies and live performances and visiting cultural sites (Eurostat 2014). Finns spend more on cultural goods and services than citizens of most European countries—with Denmark and the Czech Republic, Finland comes in at the highest rate, at over 5 percent, of total expenditure dedicated to cultural goods and services.

The Finnish government has defined its cultural objectives in stated cultural policy. According to the Ministry of Education and Culture, the objectives of Finland's cultural policy are the following:

- to provide favorable conditions for the work of artists, other creative workers, and cultural and art institutions
- to promote the preservation and development of cultural heritage and cultural environments
- to enhance equal access to, accessibility of, and diverse use of culture
- to boost production, employment, and entrepreneurship in the cultural sector
- to reinforce the cultural foundation of society

Issues

Violence against Women

Despite gender equality and women's rights featuring prominently in Finland's national politics and culture, and despite being a leading nation in gender equality, Finland struggles with issues of domestic violence and violence against women. Though Finns do not countenance violence toward women, such crimes have traditionally been viewed as a private, not a public, matter. According to a report published by the European Commission in 2010, 68 percent of Finns felt that violence against women is unacceptable and should be punishable by law, compared to 84 percent of EU citizens. The study found that 32 percent of Finns believe that, though violence against women is unacceptable, it should not always be punishable by law, while only 12 percent of EU citizens were of this opinion (European Commission 2010).

In the same year, Amnesty International published the report *Case Closed: Rape and Human Rights in the Nordic Countries*, which determined that victims of rape have little chance of seeing the perpetrators convicted, or even brought to trial, and that offenders therefore are rarely held accountable for their crimes. In Finland, according to the latter study, it is estimated that fewer than 10 percent of rapes are reported to the police. Under Finland's penal code, one of the three main categories of rape, coercion into sexual intercourse, makes rape a "complainant offense," which means that the victim must press charges and that the state will not prosecute if the victim drops charges "of his or her own free will." This applies to some situations of sexual abuse, including abuse of underage victims, whose guardians may then revoke charges.

In a 2012 survey by the European Union for Fundamental Human Rights, Finland was ranked as having the second-highest rate of violence against women; 47 percent of respondents affirmed that they have experienced physical or sexual violence by a partner or nonpartner since the age of 15. Asked about physical violence alone, 43 percent had experienced it, still ranking Finland at second. Removing physical violence from the question and inquiring about sexual violence only, 17 percent of women said that they had experienced sexual violence by a partner or nonpartner since the age of 15, placing Finland fourth, below Denmark, the Netherlands, and Sweden (European Union Agency for Fundamental Rights 2014). More recent studies have shown that violent crimes against women immigrants are also prevalent. The Finnish government has taken action to decrease violence against women, for example, with the 2010 *Action Plan to Reduce Violence against Women*, published by the Ministry of Social Affairs and Health.

France

Overview of Country

France is located in Western Europe and is the country with the largest landmass in the European Union. Its borders are created by natural boundaries of water and mountains, which give it a distinctive hexagonal shape. The French frequently refer to their country by the nickname *l'Hexagone*. There are 62,814,233 people who live in metropolitan France, which includes the island of Corsica. An additional 34,447,779 people inhabit France's five overseas territories of French Guiana, Guadeloupe, Martinique, Mayotte, and Reunion. Paris, located in the *Île-de-France* region, is the capital of France and its largest city. Over time, the demographics of France have changed to include people from various countries, with the majority of immigrants coming from Algeria, Morocco, China, and Tunisia (CIA 2014).

During the French Revolution, which lasted from 1789 to 1799, the people of France overthrew the monarchy and established the First Republic. Since the founding of this government, the French people have endured several more politically motivated transitions, including the rise and fall of Napoleon Bonaparte, the return of the monarchy, and then a shift back to democracy. France's current government is known as the Fifth Republic and was founded in 1958 by Charles de Gaulle.

Throughout its history, France has made important contributions to art and culture. It is home to many prominent museums, and it has well-established literary and cinema traditions. France has also played a key role in elevating the art of fashion and food with what is referred to as *haute cuisine* and *haute couture*—high food and high

fashion. France's reputation as one of the culture capitals of the world draws around 79 million tourists per year, making it the most popular tourist destination in the world. France's tourist industry is the most lucrative industry in its economy (CIA 2014).

Women have always been an important part of French history and culture. The symbol of French Republican ideals is embodied by the image of a woman, named Marianne, wearing a Phrygian cap (a classical symbol of freedom). The image of Marianne appears on coins, stamps, government letterheads, and Web sites. Over the past century, French women have achieved recognition in many different areas, from Edith Piaf's unique style of singing, to Coco Chanel's elegant fashions, to Simone de Beauvoir's groundbreaking philosophical writings.

Contemporary French women are continuing to shape France and its role in the world. However, women in France still face many challenges concerning gender equality. In 2015, the UN Development Programme (UNDP) ranked France 19th out of 188 nations based on its Gender Inequality Index (GII; 0.102) (Gender Inequality Index 2015).

Girls and Teens

Education

Prior to the French Revolution, the Catholic Church educated young French women. In 1881, Jules Ferry (1832–1893), the minister of education, introduced new laws that made education free and compulsory for all men and women. Over time, the French school system evolved and is now divided into four parts: *l'école maternelle* (ages 3–5 years), *l'école primaire* (ages 6–11 years), *collège* (ages 11–15 years), and *lycée* (ages 15–18 years). At the end of their final year of *lycée*, students prepare to take the *baccalauréat* exam, which is often referred to colloquially *le bac*. To attend college, students must obtain this degree. More female than male students take *le bac* each year. They also have a higher rate of passing it.

Le bac is divided into three streams: sciences, economics and social sciences, and literature and humanities. Most female students opt for the literature and humanities track of *le bac* as opposed to the science track. Any student who passes *le bac* and pays a few minor fees can attend a state university; however, these schools are often overcrowded and are not well funded. Students can also try to gain admission to one of the prestigious *grandes écoles*, which are known for producing some of the top leaders in

French industry and government. Students usually take a two-year preparation course to assist with passing the difficult entrance exam that *grandes écoles* require. On average, fewer women apply and are admitted to *grandes écoles* than men. This trend has a significant impact on French society, as the low rate of female students at these prestigious schools mean that only a small number of women graduate and obtain high-ranking positions in business and government.

In 2013, the Ministry of National Education implemented the ABCs of Equality pilot program in 275 schools. The ministry's ultimate goal was to extend the program to all French elementary schools by 2018. The ABCs of Equality tried to address and eliminate gender stereotypes in the classroom. However, the initiative met with objections from conservative members of French society. They feared that instructors were teaching gender theory to young children, and rumors circulated that learning about masturbation was part of the curriculum. These rumors were unfounded but effective in alarming parents. To protest the program, many parents kept their children home from school in an organized boycott. Even though the majority of participating instructors supported the initiative and felt that it was a positive addition to the classroom, government officials revised their initial plan in the wake of public outcry. Under the new plan, teaching gender equality in the classroom is no longer mandatory but optional for all instructors. Those who supported the initial program feel that this revised initiative will not be effective.

Everyday Life

With rigorous demands at school, French teens spend much of their free time on homework, which leaves little opportunity for a part-time job. For fun, teenagers like going to parties, seeing movies, attending concerts, playing sports, and going on weekend excursions with their families. The most popular pastime among teenagers is spending time with their friends.

Most teenagers have a cell phone. They spend less time watching television than adults and spend more time on their computers (Nabli and Ricroch 2013, 3). On average, French adolescents spend about an hour each day on their computers. The most popular Internet activity is instant messaging. They also write e-mails, use social media, post to forums, watch videos, and listen to music.

France's Ministry for Youth Affairs and Sports provides young people with a variety of resources. French citizens

under the age of 26 can access museums for free, apply for financial aid to go on vacation, take summer school courses, and find internships. They can also participate in the ERASMUS+ program, a very popular exchange program that allows students to study abroad in other European countries.

Health

Access to Health Care

The French health care system is frequently ranked among the best in the world. This system consists of a combination of universal public care and voluntary private coverage. Individuals receive coverage through their employer and can elect to purchase additional insurance from a private company. To fund this system, France spends 11.6 percent of its gross domestic product (GDP) on health care services. However, the United States far outspends France on healthcare, spending about twice as much per person on health care services (OECD 2013).

On average French women live to be 85 years old, and French men live to be 78 years old. Since 1992, cancer has become the leading cause of death in France, which is attributed to high rates of tobacco and alcohol consumption. For women, breast cancer is the most prevalent form of cancer. The most frequently diagnosed forms of cancer among men are lung and colorectal cancers (Prioux, Barbieri, and Reeve 2012).

Maternal Health

France ranks highly for maternal health, with only 8 maternal deaths per 100,000 live births each year (CIA 2014). Under France's health care system, it is easy for women to obtain prenatal and postnatal care. The Mother and Child Protection Service (PMI) handles services related to the health of mothers and their children from birth to age six. Such services include nurses who pay free home visits to new mothers. The purpose of these visits is to make sure that both mother and child are healthy and well-adjusted.

Contraceptives

In 1920 and 1923, laws were passed that made distributing contraceptives and information about contraceptives illegal. In 1956, Dr. Marie-Andrée Lagroua Weill-Hallé formed *La Maternité Heureuse* (Happy Motherhood), a private organization that distributed information and

contraceptives to members. In 1961, the group opened the first family planning clinic, and within five years, they had opened 122 more clinics in various parts of France. By the mid-1960s, *La Maternité Heureuse* became the French Movement for Family Planning. Women's rights groups continued to successfully lobby for changes in laws about women's reproductive rights. Birth control became legal when the Neuwirth Law was passed in 1967.

Since 1967, the birth control pill has become the most frequently used form of contraception among French women (Bajos et al. 2012, 1). Because of increased access to contraceptives, the rate of unwanted pregnancies declined from the late 1960s to the 1990s (Rossier et al. 2009, 444). In 2012, a debate about possible birth control pill side effects was closely covered in the media. There were concerns that certain birth control pills might be linked to health complications such as deep vein thrombosis and even death. With this negative publicity came a shift in birth control practices. In 2010, about 50 percent of sexually active women used the pill, but this number had dropped to 41 percent of women by 2013. Women under the age of 30 were the most likely to change their contraceptive practices. Researchers cited the media coverage as the reason for this dramatic shift; however, it remains to be seen whether this trend will carry forward over time (Bajos et al. 2014, 1–2).

In 2000, the government decided to address France's high teen pregnancy and abortion rates. The acting minister of education, Ségolène Royal, announced that young girls could obtain emergency contraceptives from their school nurse. The ability for minors to obtain access to birth control without parental consent became legal the following year under the Aubrey Law. The morning-after pill also became available without a prescription (Bajos et al. 2012, 1). Since 2013, girls aged 15–18 have been able to obtain free birth control from pharmacies in addition to emergency contraception.

Abortion

A 2010 study estimates that 35 percent of French women have aborted a pregnancy at least once in their lives (Prioux, Barbieri, and Reeve 2012). Most women who obtain abortions are between the ages of 20 and 29 (Rossier et al. 2009, 450). Women in France have the option of undergoing a surgical abortion or a medical abortion.

The women's rights groups that played a pivotal role in legalizing contraception were also at the forefront of the fight to legalize abortion, or *interruption volontaire*

de grossesses (IVG). A critical turning point in the debate around abortion came in 1972 when a young girl was raped by a fellow classmate and became pregnant. The girl's mother helped her to obtain an illegal abortion. After the procedure, the girl was hospitalized due to complications. Eventually, the girl and her mother were put on trial along with the abortionist and a family friend who assisted with arranging the illegal procedure. In response, the girl's mother contacted the feminist organization *Choisir* for assistance. This group was dedicated to fighting for change in abortion law and to representing women who were being tried for undergoing illegal abortions. The previous year, the group had submitted a manifesto to the newspaper *Nouvel Observateur* that was signed by 343 prominent women who had obtained abortions.

Gisèle Halimi (1927–), a founding member of *Choisir* and a skilled lawyer, took on the case. Halimi successfully defended the women involved, and the charges were dropped. This verdict paved the way for future changes in abortion law and created widespread debate on the topic. President Giscard d'Estaing appointed Simone Veil as the minister of health and charged her with resolving the matter. Veil's abortion bill became law in 1975 after intense debate. The new Veil Law gave women the option of having an abortion during the first 10 weeks of pregnancy. This law was far from perfect and came with restrictions that frustrated many women. For example, a woman had to prove that she was a citizen before obtaining an abortion, which excluded many immigrant women from having the option of undergoing this procedure.

Over the course of the next few decades, different laws were passed that further addressed abortion rights. In 1982, the first minister for women's rights, Yvette Roudy (1929–), helped pass a law that enabled the government to cover the costs associated with getting an abortion. In addition to improving access to contraceptives, the 2001 Aubry Law also sought to facilitate improved access to abortion. The law extended the window of time during which a woman can undergo an abortion from 10 weeks to 12 weeks. Today, women no longer need to show proof of citizenship to obtain an abortion, nor do they have to complete mandatory counseling before and after the procedure.

In the 1980s and early 1990s, abortion clinics became targets of attack from antiabortion groups, in particular Catholic fundamentalists. Activities became so intense that the Neiertz Law was passed in 1993, making obstructing abortion a crime. Some extremist and militant groups

are still active today, including *Laissez-les vivre* (Let Them Live) and *SOS Tout Petits* (SOS Toddlers).

Sexually Transmitted Disease

French women, especially those in their late twenties, are more likely than men to contract a sexually transmitted disease (STD) (Ministère des Droits des Femmes 2014b, 5–6). Around 100,000 people in France are living with AIDS (known as le *syndrome d'immunodéficience acquise* or *SIDA* in France). Most cases are concentrated in the *Île-de-France* region. While men are more likely to become infected with HIV than women, the number of infected women is on the rise (Lert et al. 2004, 3).

Alcohol and Tobacco

France's alcohol consumption is one of the highest in Europe; however, recent reports show that the number of people who drink every day has fallen substantially since the 1980s, from 51 percent to 17 percent of the population (OECD 2013, 57). A new trend is on the rise among young people in France, which has been widely covered by the media: binge drinking or *beuverie express*. While this phenomenon is common among youth in the United States and Great Britain, it is a new issue in France.

In 2007, France passed an antismoking bill that banned smoking from public spaces. The following year, the law was expanded to include cafes, restaurants, and bars. While more young men smoke than young women, the number of female smokers is growing. The number of women who smoke every day has risen by 3 percent since 2005 (Ministère des Droits des Femmes 2014b, 4). This number is higher than the European average for young female smokers. Women who are regular consumers smoke an average of 12.6 cigarettes a day, while men smoke an average of 15.1 cigarettes each day (L'Institut national de prévention et d'éducation pour la santé 2012).

Mental Health

The French are among the highest consumers of antidepressants in Europe. Women are more frequently diagnosed with depression than men. Women are also more likely to take medication for their condition. Around 23 percent of women use psychotropic drugs as opposed to only 13 percent of men (L'Institut national de prévention et d'éducation pour la santé 2012). France has one of the highest suicide rates in Europe. Approximately 250,000

individuals attempt to take their own life each year. Women account for 65 percent of individuals hospitalized for suicide attempts. On average, seven to eight women kill themselves each day (Union Nationale Prévention Suicide 2013, 5–8).

Body Image

According to a recent study, French women and men have the lowest body mass index (BMI) in Europe. The study also found that French women place a high importance on being thin. Many of the women surveyed indicated that they felt the need to lose weight (Robineau and de Saint Pol 2013, 1–2). An estimated 30,000–40,000 people in France are struggling with bulimia or anorexia. While eating disorders affect people of both genders, women (especially young women) make up 9 out of 10 cases. Recently pro-anorexia Web sites have become a widely reported issue in France (Ministère de la Santé 2008, 6).

Elder Care

High birth rates coupled with longer life expectancies mean that France's elderly population is rapidly growing. By 2030, it is expected that this demographic will increase by 40 percent (Chevreul and Berg Brigham 2013, 213–214). Government officials are concerned about financing the care of this expanding part of the population. More than half of the individuals aged 65 and older are women; thus, women are more likely than men to depend on care services as they age (Mazuy et al. 2011, 424). This trend also affects younger generations of women, given that they are the most likely to fulfill the role of caretaker for elderly relatives (Bonnet et al. 2011, 1–2).

Employment

Women in the Workforce

Increased access to education along with changes brought about by French feminists created more opportunities for women in the workplace. In the late 1960s, about 35 percent of the workforce was made up of women; by 2000, that number had increased to 45 percent (Twomey 2000, 84). Between the 1970s and 1990s, new employment legislation gave women more rights as workers. Various laws addressed wage inequality in the workplace, including the 1983 Roudy Law, the 2001 Genisson Law, and the 2006 Ameline Law. All of these laws were named for the female ministers who helped push them forward.

Despite the adoption of equal pay laws, women still earn about 28 percent less than men (Gregory and Tidd 2000, 7; Morin and Remila 2013, 1). An important factor in this discrepancy is that women often work part-time jobs. Roughly 22 percent of women are employed part-time as opposed to 6 percent of men. However, even in situations where men and women hold similar jobs, men still make 7 percent more than women (Bonnet et al. 2011, 7; Institut National de la Statistique et des Études Économiques 2012, 111; Mainguené and Martinelli 2010, 2). Women are also more frequently employed on temporary contracts than men and have a higher unemployment rate (Gregory and Tidd 2000, 25 and 33).

Most women choose careers in the tertiary sector, which is commonly known as the service industry. Examples of these professions include health and social workers, teachers, hairdressers, home aid workers, and saleswomen. Women also hold fewer management positions than men. A law was passed in 2011 that called for major companies to meet a certain quota of female board members. Companies impacted by this law have more than 500 employees and earn more than 50 million euros (approximately 59 million USD) per year. Lawmakers have set a goal that 40 percent of board appointments in such companies will be filled by women as of 2017.

Working Mothers

France has the highest rate of working mothers in the European Union. French women are able to return to work at such high rates due to progressive government policies that assist working parents with child care. Along with Nordic countries, France is a leader in the European Union for providing high-quality child care resources. Working parents can take advantage of government-funded *crèches*, or day cares. Families of a certain size often receive tax breaks and increased allowances to pay for private child minders, such as nannies. The government also offers generous leave benefits for working mothers, though in some cases taking such long leaves of absence can make it difficult for women to reenter the workforce.

Family Life

Marriage, Partnerships, and Divorce

Over the past 30 years, marriage has been on the decline in France. Increasingly, couples choose to live together without getting married or decide to enter into a *Pacte Civil de*

Solidarité (PACS) (Mainguéné 2011, 1; Rault et al. 2011, 303). PACS were legalized in 1999, particularly in response to the demand among same-sex couples for the same rights as heterosexual couples. This type of civil union is unique from those of other countries in that both same-sex and heterosexual couples can become joined in a PACS. While PACS increased the rights of gay couples, these partnerships did not provide them with the same rights as heterosexual couples. For example, same-sex couples in a PACS could not adopt. Since PACS were first introduced, they have also become a popular option for heterosexual couples. The number of heterosexual couples entering into these unions grew from 20,000 to 205,000 over the course of 11 years alone. Heterosexual partners now account for nearly 95 percent of couples entering into a PACS (Rault et al. 2011, 303–304).

Each year, there are 26 divorces for every 1,000 marriages in France. Over half of these divorces are with the consent of both parties (Mazuy et al. 2011, 380). Divorce is most common after five years of marriage. Women are more likely to ask for a divorce than men. When a couple divorces and children are involved, the children end up living with their mother in over 75 percent of cases (Institut National de la Statistique et des Études Économiques 2012, 84–85).

Children

A majority of French adults have children at some point in their life. In fact, it is very rare among French men and women to decide to remain childless (Debest et al. 2014, 1). French women have one of the highest rates of fertility in Europe, giving birth to about two children, on average (Prioux, Mazuy, and Magali 2010, 364–365). Due to various changes in society, such as more diverse educational opportunities, a greater role in the professional world, and increased access to birth control, French women have been putting off having children until a later age since the 1970s. On average, women usually have their first child at age 28 (Ní Bhrolchain and Beaujouan 2012, 1). Today, roughly 8 out of 10 births are planned, which is possible due to the variety of birth control options now available. Couples also have more control over the length of time between pregnancies. On average, couples prefer to have a space of three years between births (Régner-Loilier and Leridon 2007, 3).

LGBTQ Rights

In the 1980s, homosexuality was decriminalized under President François Mitterrand (1916–1996). In 2013,

France became the 14th country to legalize same-sex marriage, or *mariage pour tous* (marriage for all). This law is also commonly referred to as the Taubira Law, for Christiane Taubira, the French minister of justice who played a vital role in helping pass this legislation. The idea of same-sex marriage sparked controversy in France. Hundreds of thousands of people took to the streets in protest when the law passed. *Manif Pour Tous* (March for All) is a right-wing organization that has been extremely vocal in its opposition to the legalization of same-sex marriage.

More than 7,000 marriages have been performed since same-sex marriage became legal. This law also made it legal for same-sex couples to adopt children. However, the law has not resolved all the issues that same-sex couples face when trying to start families. In France, surrogacy is illegal for everyone. Lesbian couples are also banned from in vitro fertilization and artificial insemination. As a result, couples often look abroad to start a family. Lesbian couples frequently travel to Belgium to obtain access to fertility treatments.

While the initial legislation on sex-same marriage was intended to make becoming a parent via assisted reproductive technology easier for gay and lesbian couples, this part of the law was removed in the wake of severe protests. The government stated that it plans to revisit this issue sometime in the future. For some same-sex couples, the new marriage law has been inadequate in another way. France has agreements with certain countries to respect their marriage policies. This means that if one person in a same-sex couple is still a citizen of a country where gay marriage is illegal, the couple may be prohibited from marrying in France.

In recent years, France has led the way for change in other parts of the LGBTQ community. As of 2010, France became the first country in the world to stop labeling transgender identity as a mental illness, a decision that affected an estimated 40,000–60,000 French citizens (Joseph 2010). This is a major breakthrough in how transgender individuals are viewed and treated by society, but there are still many challenges to overcome. For example, before transgender individuals can legally change their gender, they must be sterilized and undergo sex reassignment surgery. This is an issue of contention among the transgender community, as it is not the goal of everyone who identifies as trans to undergo this type of surgery.

Household Roles and Responsibilities

Even though women now spend more time outside of the home as part of the workforce, they still devote more

time each day to household chores and parenting than men. While the gap between the amount of time men and women spend on domestic tasks has narrowed in recent years, studies have found that it is because women are choosing to spend less time on these tasks rather than men choosing to spend more time on them (Solaz and Wolff 2014, 1).

Politics

The French Republic

France's government is made up of three branches. The executive branch consists of the president, who is elected directly by the people, and a prime minister, who is appointed by the president. The French Parliament is bicameral (containing two chambers) and is made up of the *Assemblée Nationale* (the lower house) and the *Sénat* (the upper house). The people vote directly for the members of the *Assemblée Nationale*, and an electoral college elects members of the *Sénat*.

Rights and Participation

The idea of universal suffrage emerged from the French Revolution, but in the early days of the Republic, the concept of universal suffrage excluded women. When Napoleon came to power, he created the Napoleonic Code, in 1803, which further limited women's rights. After the end of World War II, women were finally granted the right to vote in 1944. Many people felt that women had earned this right through their hard work and sacrifices during the war.

Feminism

During the 1970s, the French feminist movement, known as *le Mouvement de libération des femmes* (MLF), reached its heyday. Prior to the 1970s, feminist groups existed and were active; however, these groups did not achieve the level of notoriety that later groups did. Various factors paved the way for the MLF to gain traction. During the 1960s, more women began reading and writing literature about women's rights. This sparked the growth of a feminist consciousness in France. Another important factor was the Events of May 1968, which became a turning point in how women viewed themselves and their rights.

The Events of May 1968 began at the University of Nanterre, when college students started protesting the quality

of their education. These protests evolved into protests against other aspects of French society, such as capitalism. The protests soon spread to other universities and eventually to workplaces. Throughout these events, women were an active presence; however, they frequently felt marginalized and ignored by the men of the movement. They began to feel that this new movement would not enable them to fight for their rights as women. It was from this discontent that the MLF was born.

The MLF was composed of diverse groups with differing politics. Scholars have divided the movement into three main subgroups: feminists interested in class struggle, those who were nonaligned or revolutionary, and a group called *Psychanalyse et Politique* (*Psych et po*). Members of the movement were active in staging public events that drew attention to their cause. One of their most famous acts was the laying of flowers at the Tomb of the Unknown Soldier in honor of his wife. The activism of these women was crucial in creating political and social changes for women. However, by the 1980s, the MLF had begun to lose support. Today, a unified women's movement is not active in France, but small feminist groups continue to be active around specific causes.

Women in Office and Parity

During the 1970s, there was an increase in the number of women appointed to political office. When Valéry Giscard d'Estaing (1926–) became president in 1974, he created the Secretariat of State for the Condition of Women and asked Françoise Giroud (1916–2003) to fill this role. That same year, Simone Veil became the first woman to hold a senior ministry position as the minister of health. During the 1980s, President Mitterrand transformed the Secretariat of State for the Condition of Women into the Ministry for the Rights of Woman. He selected Yvette Roudy to serve as its first minister. In 1991, Edith Cresson became the first female prime minister of France; however, her appointment was short-lived, lasting less than a year. To date, there has not been a female president of France.

Despite these steps forward, France continued to struggle with a low representation of women in politics. Over the course of nearly 50 years, the number of female representatives in Parliament increased by less than 1 percent (Mossuz-Lavau 2002, 1). In 1992, Françoise Gaspard, Claude Servan-Schreiber, and Anne Le Gall published the book *Au pouvoir citoyennes! (Women Citizens to Power!)*. The goal of this work was to advocate for parity, or enforced

Académie Française

Cardinal Richelieu established the Académie Française in 1635. For nearly 400 years, it has functioned as the official entity that oversees the preservation and standardization of the French language. Part of the Académie's work is to compile the *Dictionnaire de l'Académie Française* and to award various literary prizes each year. The Académie is made up of 40 members, known as *immortels*, who occupy their position for life. Alexandre Dumas, Victor Hugo, and Voltaire each held one of these positions during their lifetimes.

Of the 726 *immortels*, only 8 of them have been women: Marguerite Yourcenar (elected in 1980), Jacqueline de Romilly (elected in 1988), Hélène Carrère d'Encausse (elected in 1990), Florence Delay (elected in 2000), Assia Djebar (elected in 2005), Simone Veil (elected in 2008), Danièle Sallenave (elected in 2011), and Dominique Bona (elected in 2013). Since 1999, Hélène Carrère d'Encausse has served as the *secrétaire perpétuel* (perpetual secretary) of the Académie. She is the first woman in the history of the Académie to occupy this leadership position.

equality, between men and women in French politics. After the publication of this book, a movement for parity rapidly emerged.

The concept of parity was not without controversy. Those not in favor of parity felt that it violated the principles of the French Republic. These individuals argued that it would divide citizens into groups, thus violating the republican ideal that all people are the same in the eyes of the law. Parity supporters counterargued that the republican ideal of universal rights for all citizens had only been applied to men throughout French history. In their view, parity was the only way to ensure the equal inclusion of women in the political process, which would in turn create a *true* democracy.

With the movement gaining momentum among the media and the public, government officials felt the need to address the issue. They eventually sided in favor of parity. The official Parity Law was passed in 2000, and with it, France became the first country in the world to embrace gender parity in politics. Under the new law, political parties must present an equal number of male and female

candidates in all elections (both local and national) or face fines.

Despite some parties preferring to pay fines rather than to produce female candidates, the number of women in the French Parliament has grown. In 1997, the percentage of women in the *Assemblée Nationale* was 10 percent; today, it 26.2 percent (Twomey 2000, 9). However, even with this progress, France still ranks low in the number of female members of parliament compared to other countries around the world. As of 2014, France is ranked 48th in the world for female representation (IPU 2014).

In recent years, various female politicians have run for high-ranking political offices. In 2007, Ségolène Royal of the *Parti Socialiste* (a left-wing group) ran for the presidency. Royal lost to her opponent, Nicolas Sarkozy, a member of the *Union pour un mouvement populaire* (a right-wing group). In 2012, other women campaigned to become president of the French Republic. During the first round of the election, three women were in the running: Marine Le Pen of the *Front National* (a far-right conservative party), Eva Joly of the *Europe Écologie Les Verts* (the Greens), and Nathalie Arthaud of *Lutte Ouvrière* (the Communist Union). None of these women moved on to the second round of the election, and ultimately François Hollande of the *Parti Socialiste* (a left-wing group) won the 2012 election. Marine Le Pen ran again in 2017 and made it to the final round of the election, however she was defeated by Emmanuel Macron of the new *En Marche!* party.

Female leaders are emerging in other areas of politics as well. Christine Lagarde (1956–), the former French minister of finance, was appointed the Managing Director of the International Monetary Fund (IMF) in 2011. During the 2014 election for the mayor of Paris, a very powerful position, two women ran against one another. Nathalie Kosciusko-Morizet represented the *Union pour un mouvement populaire*, and Anne Hidalgo ran as the *Parti Socialiste* candidate. Hidalgo, a child of Spanish immigrants, won the race and became the first female mayor of Paris.

Religious and Cultural Roles

Religion

The predominant religion in France has historically been Catholic, with the majority of today's population (83%–88%) still identifying as members of the Roman Catholic Church. Muslims are the next largest religious group and represent 5–10 percent of the total French population. About 4 percent of the French consider themselves

unaffiliated with any religion, 2 percent identify as Protestant, and 1 percent identify as Jewish (CIA 2014).

The growing number of Muslims in France has sparked controversial policies, the most famous being the Islamic head-scarf affair, or *l'affaire du foulard*. In September 1989, three young North African women were asked to remove their hijabs (head scarves) at their school in Creil. When they refused, they were expelled for violating the concept of *laïcité*, an idea somewhat similar to the American concept of secularism. After the terrorist attacks of September 11, 2001, in the United States, there was a renewed outcry against hijabs in French society. This resulted in a 2004 ban that made it illegal to wear a hijab in public. Women refusing to remove their hijabs now face fines. Those who supported the ban believe the hijab is a representation of women's oppression and that it has no place in a democracy. Others see the ban as a xenophobic response to the growing number of immigrants in France and the increasing popularity of right-wing politics. As for Muslim women, their opinions were not sought out during these debates. However, it seems that Muslim women are themselves divided on whether the hijab ban is liberating or oppressive.

According to a recent human rights survey, the prevalence of anti-Semitism is rising in France. In 2001, roughly 219 anti-Semitic actions were reported; in 2011, that number increased to 389 actions (European Union Agency for Fundamental Rights 2014, 27). A separate study the following year polled Jewish citizens about their perceptions and experiences with hate crimes in European countries. Among these participants, 85 percent felt that anti-Semitism was a major problem in France (European Union Agency for Fundamental Rights 2014, 17).

Immigrant Women

A key element in the discussion surrounding immigrants in France is the concept of an *immigré*. The term *immigré* refers to individuals from former French colonies, such as Algeria and Vietnam, who are of color. In France, these immigrants are more likely to experience discrimination and unequal treatment as opposed to immigrants from other European countries. Many *immigré* women relocate to France to be reunited with their families; however, there is a growing trend of women who come alone to pursue an education or a career.

Female *immigrées* are not part of a homogenous group. They are women with different life experiences, outlooks,

and struggles. However, these women frequently encounter similar issues and can feel cut off from the rest of society. In the 1980s and 1990s, a series of laws were created that curbed immigrant rights and placed restrictions on obtaining citizenship. Due to these restrictions, many immigrant women reside in France illegally. Limited access to work opportunities outside of the home, difficulty communicating in a foreign language, and a lack of financial independence are further challenges that these women face on a daily basis. Such issues make it difficult for immigrant women to feel connected to French society and their new home, thus creating a sense of isolation. Some immigrant women have created support groups, such as *Voix d'elles Rebelles* and *Meufs Rebeus*, to help each other cope with these feelings and to establish a sense of community. The children of immigrants are also a vulnerable demographic in French society. Children born to immigrant parents must live in France until the age of 16 before they are granted citizenship. This law limits the rights and resources available to these children and their parents.

In 1996, the struggle of immigrants became a huge topic of debate in the media with the formation of the *Sans Papiers* (Without Papers) movement. This movement started with 300 African immigrants who had been denied or were unable to obtain citizenship papers. They began by occupying the church of Saint-Ambroise in Paris for the duration of that summer, eventually moving to other locations. Immigrant women played a key role in this movement. In addition to helping keep the group united, they staged a women's march and participated in hunger strikes. One immigrant woman, Madjiguène Cissé, became a leading spokesperson for the entire *Sans Papiers* movement.

Issues

Domestic Violence

Domestic violence is an issue that impacts women of all social classes in France. While feminists fought to bring attention to the issue and provide resources for victims during the 1970s and 1980s, it was not until the 1990s that violence against women became an issue that was widely acknowledged. In 1997, the Office of Women's Rights commissioned the National Survey on Violence against Women in France (ENVEFF) to examine the frequency of domestic and sexual violence in France. It was the first statistical study carried out on this topic (Jaspard et al. 2001, 365; Fougeyrollas-Schwebel 2005, 290). By 2000, the results had

become publicly available and were published three years later (Allwood and Wadia 2009, 137–141). According to the survey, 1 in 10 women have been victims of domestic violence (Fougeyrollas-Schwebel 2005, 299). This figure shocked the public.

The study also uncovered other trends, such as the fact that women aged 20–24 are more likely than any other age group to experience violence (Fougeyrollas-Schwebel 2005, 293). According to the results, women of all social classes experience violence. In a majority of these cases, the woman's attacker is her partner or husband (Jaspard et al. 2001, 364). Perhaps one of the most significant findings the survey uncovered was the extent to which women conceal their abuse. Half of the participants stated that it was their first time reporting their experiences (Jaspard et al. 2001, 365).

After the survey results were published, public awareness and action increased. In 2004, Nicole Ameline, the minister for parity and work equality, announced a 10-point plan for fighting domestic violence. In 2006, the Domestic Violence Act was passed. In 2013, the minister for women's rights unveiled a large-scale action plan that aims to provide improved resources for victims of domestic violence. Over the course of the next three years, the government plans to spend 66 million euros (approximately 77 million USD) on this initiative, and domestic violence will be classified as a public health issue for the first time. Some of the resources the government plans to fund include the creation of 1,650 new women's shelters by 2017, training for 350 additional social workers to assist police with abuse cases, and extended emergency helpline hours (Ministère des Droits des Femmes 2014a, 4).

The feminist organization *Ni Putes Ni Soumises* (Neither Whores nor Submissives) is dedicated to fighting against the violence that women, especially immigrant women, frequently experience in French suburbs. The suburbs, or *banlieues*, can be dangerous places where crime and gang violence are common. This movement started after the horrific murder of a young woman who was living in the suburbs in 2002. Sohane Benziane (1984–2002) was burned alive by her former boyfriend after refusing to go out with him again. After this incident, Fadela Amara (1964–), another woman from the *banlieues*, worked with others to form a march to protest the treatment of women in the *banlieues*. More than 30,000 people marched through cities across France for this cause. The march ended with a demonstration in Paris on International Women's Day in 2003. Today, many other organizations exist that are

dedicated to fighting violence against women; however, this group remains one of the most well-known.

Sexual Assault

The 2000 ENVEFF survey also raised awareness about sexual violence in French society. Approximately 50,000 women were raped during the year the survey was conducted. This was another survey statistic that shocked the public (Fougeyrollas-Schwebel 2005, 299). In 2006, researchers conducted a follow-up survey to the ENVEFF that asked the same set of questions. According to these new survey results, about 16 percent of women and 5 percent of men had experienced unwanted sexual advances. As was discovered with the earlier ENVEFF survey, individuals in all social categories had experienced violence. The 2006 survey also found that young women were more likely to report incidents of violence to authorities. Those studying the results concluded that this might be in response to increased public awareness and the success of antiviolence campaigns after the publication of the 2000 ENVEFF survey results.

Sexual harassment in France became a major topic of debate after the 2011 Dominique Strauss-Kahn scandal. Strauss-Kahn, the former head of the IMF, was accused of sexually assaulting a hotel maid in New York City. This incident threw the spotlight on the pervasiveness of sexual harassment in French society. It is estimated that 20 percent of women (one in five women) have experienced sexual harassment at work. In 2012, France passed a new law on sexual harassment that changed its status to a criminal offense. Convicted offenders now face higher fines and up to three years in prison.

Sex Workers

Sex work has a long history in France. For more than 100 years it was a regulated profession, until 1946, when brothels were declared illegal and shutdown. Prostitution was legalized again in 1960 and subsequently became a controversial topic of debate. Under President Nicolas Sarkozy, the Domestic Security Law was passed in 2003, which made prostitution a serious offense with prison time. Critics of this law felt that it criminalized sex workers and not their clients, thus pushing sex workers further away from the protection of the police. In 2013, another bill was introduced in a further attempt to abolish prostitution. This new legislation proposed fines for individuals who purchased sex. The bill passed in the *Assemblée Nationale*, but it was

rejected by the *Sénat* over concerns that it would force sex workers to operate in isolation, something that could put them at a greater risk of violence or unprotected sex.

Gendered Language

The French take great pride in their language. It is an integral part of their culture and something they actively strive to preserve. In recent years, there has been an ongoing debate about how to correctly represent women's changing social status within the rules of French grammar.

French is a gendered language, which means that nouns use masculine or feminine articles and masculine or feminine endings. An adjective must also agree with a noun to reflect the appropriate gender. The gendering of French nouns becomes problematic in certain situations. Such is the case with job titles that have traditional masculine spellings, for example, *le ministre* (the minister) or *le médecin* (the doctor). As more women enter male-dominated fields, the question persists of how to properly refer to them. While other French-speaking countries, such as Belgium, have come up with their own strategies, the French have yet to find an official solution. One common strategy is to simply feminize a noun's article and to leave the noun itself the same. For example, the masculine title *le ministre* would become *la ministre* for a woman.

In 2011, the feminist organizations *Osez le Féminisme!* (Dare to Be Feminist!) and *Les Chiennes de Garde* (the Watchdogs) launched a campaign to drop the use of the word *mademoiselle*, which is the French form of "Miss." In France, there is no equivalent to the American term "Ms.," which can be used to refer to either a married or an unmarried woman. French women only have the option of being referred to as *madame* (Mrs.) or *mademoiselle* (Miss). Supporters of the campaign against using the term *mademoiselle* argued that the word reinforces sexist values and forces women to unnecessarily disclose information about their personal lives, such as marital status. In 2012, the title *mademoiselle* was officially removed from government forms, leaving only *madame* as an option. Many women viewed this change as a huge victory, while others felt that the campaign was unnecessary.

G

Georgia

Overview of Country

Georgia is located to the east of the Black Sea, bordering Turkey, Armenia, Azerbaijan, and Russia. Georgia's north border is formed by the Caucasus Mountains and the Lesser Caucasus Mountains that dominate the central and south areas of the country. The country is 26,900 square miles (69,700 sq. km) and consists of mountainous, wooded geography with a varying regional climate that is humid in the coastal areas and cold and dry in the inland mountain areas. As of the 2014 census, Georgia has a population of 4.5 million (World Bank 2014).

In 2015, the UN Development Programme (UNDP) ranked Georgia 76th out of 188 countries based on the Human Development Index (HDI; 0.754). This is an increase of 12.2 percent in Georgia's HDI since 2000 (UNDP 2015). One reason for the low score is Georgia's designation as a place of female labor and sex trafficking, but the score has been improving as Georgia's government works to bring about greater equality and opportunity for citizens (UNDP 2015). For instance, recent austerity measures have led to rapid inflation and a decrease in government subsidies and social programs that benefit women and children (Ortiz and Cummins 2013, 63–64).

Georgia gained independence from the Russian Federation in 1991 (Nichol 2013). Following their independence,

Georgians experienced separatist conflict from 1992 to 1994, leading to mass migration (Hofmann and Buckley 2013, 213). The political tumult also led to widespread income inequality. Between 1991 and 1994, Georgia experienced a gross domestic product (GDP) drop from USD\$4,103 to USD\$1,328 (Habibov 2012, 210). It was not until 2006 that Georgia returned to its preindependence GDP (212).

In August 2008, the Russia-Georgia conflict displaced citizens, caused economic instability, and unsettled Georgia's military (Nichol 2013). Once again, Georgia saw its GDP fall (Habibov 2012, 219). According to Human Rights Watch (HRW), since the last conflict, Georgia has made progress on the human rights front but has continued to fail in bringing about equality in terms of justice (HRW 2016).

The largest human rights struggle currently experienced in Georgia is the displacement of citizens, particularly ethnic minorities. Recent reports assert that ethnic minorities in Georgia experience a lack of access to employment and education (Nichol 2013). Though the Georgian Constitution calls for the acceptance of "social, economic, cultural, and political life" of all citizens, legislation is published only in the Georgian language and not in minority languages, and interpreters are not dependable (Richmond 2009, 2). Minority Rights Group International, a group that researches and works for the rights of indigenous populations around the world, including religious,

ethnic, and linguistic minorities, lists the following as Georgian ethnic minorities: Abkhaz, Ajarians, Armenians, Azeris, and Ossetians (Richmond 2016). Other ethnic minorities include the Meskhetians, a Muslim group who left Georgia during Soviet control (Richmond 2009, 1).

According to the UN *Convention on the Rights of the Child*, female children are disproportionately the victims of discrimination due to their gender (United Nations 2008, 5). However, UNICEF notes that Georgia is making strides in improving living conditions for women and children by seeking out the advice of UN organizations and implementing programs that have led to increased educational success, multilingual programs, health care initiatives, and improved maternal health (UNICEF 2011, 5). However, UNICEF also points out that there is little reliable research on the lives of women and children in the areas of Abkhazia and South Ossetia, leading to a lack of reportable information about women and girls in those regions (5).

Girls and Teens

Due to a lack of disaggregated data and the relatively young age of Georgia as a country, little research has been done to learn more about the lives of girls and teens in Georgia. Much of the research on Georgian youth refers to both male and female minors. However, traditional patriarchal roles within the adult population translate into similar gender roles for youth. Girls are more likely to learn to cook, clean, and care for children than their male counterparts (Corso 2014).

Sports

As a means of increasing organizations for teens, the Georgian government founded the Ministry of Sport and Youth Affairs (MSY) in 2010 (UNICEF 2011, 59). This and other organizations and campaigns are aimed at encouraging youth to live healthy lifestyles (59).

Recreation

Chess is a popular pastime for Georgian girls. Georgian tradition dictates that parents bestow a chess set to their daughters upon marriage (Goletiani 2016). Georgia is the home of many chess champions. Together, Maia Chiburdanidze (1961–) and Nona Gaprindashvili (1941–), who won the championship at 13 years old, have held the Women's World Chess Champion title for a combined 30 years (Goletiani 2016).

Literacy

Georgia has a very high literacy rate of 99.7 percent (UNDP 2015). However, it is not clear whether that literacy extends toward ethnic minorities. For instance, state services and most of the educational system are conducted in Georgian, even those located in areas of Georgia where the population is representative of minority languages (Richmond 2009, 3). Additionally, national schools test students' knowledge of Georgian language and literature (3).

From data that is available, it appears that girls have the same or better educational opportunities as their male counterparts. The United Nations reports that, on average, females experience 14 years of schooling as compared to the 13.6 years of schooling reported for males (UNDP 2015).

Sex Education

Premarital sex is discouraged and taboo within Georgia. The Georgian Orthodox Church does not permit premarital sex, resulting in high disapproval ratings in surveys about Georgian attitudes toward premarital sex (Lomsadze 2010). No data exists on sex education for minor children, and surveys of contraceptive use indicate that the only education that women receive on contraceptive use and pregnancy prevention is from nongovernmental organizations (NGOs).

Health

Because of a lack of reporting and the lack of medical care sought by Georgian citizens, reported rates of disease and illness are likely incomplete. Additionally, the conflict displacement of citizens has led to difficulty tracking information on particular groups and their health care.

In 2011, the National Statistics Office of Georgia reported rates of abortion, syphilis, gonorrhea, tuberculosis (TB), HIV/AIDS, mental illness, cancer, and suicide within the country. With the exception of cancer, there were fewer reported incidents for women in all categories (National Statistics Office of Georgia 2011, 19). Much of the research available points to the health of displaced families, maternal health, and sexually transmitted diseases (STDs) as being the most prevalent concerns for Georgian women and children.

Access to Health Care

In 2008, the Georgian government initiated a medical insurance program for families under the poverty line called MAP (UNICEF 2011, 11). The country has seen

utilization of free health care as a result, but those who do not receive MAP are unable to afford health care, which can lead unqualified families to poverty (11). UNICEF reports that Georgia has one of the highest citizen health care costs in the area, causing people to avoid care, though the government is reforming health care in an attempt to provide widespread, affordable coverage (22).

The United Nations issued a 2011 report that a majority of medical doctors in Georgia were women. As of 2009, researchers have documented 13,787 female doctors and 6,822 male doctors in Georgia (National Statistics Office of Georgia 2011, 16).

Health of Displaced Women

There are many displaced women in Georgia due to ongoing conflict. One challenge of displacement is adequate health care. Despite state insurance and free medical care, displaced Georgians have difficulty obtaining adequate medical care because of a lack of comprehensive coverage and difficulty locating assistance because health services lack funding (Doliashvili and Buckley 2008, 22). Of the general population, 50 percent do not seek medical treatment when they experience health problems, and that number increases in the displaced Georgian population (22). The conflict and resulting displacement are of concern as well, as they may lead to mental health problems. Due to ongoing conflict, women in Georgia show symptoms of somatic distress, or physical ailments that cannot be explained by medical conditions.

A 1999 health survey reported that sexually active displaced Georgian women aged 15–44 experienced higher than average rates of anemia, asthma, hypertension, heart failure, hepatitis B infections, and urinary infections. Additionally, displaced women experience higher than average rates of some STDs (22).

Tobacco Use

The Tobacco Atlas, a group founded by the American Cancer Society, reports that, in 2013, 2.8 percent of Georgian girls and 4.5 percent of Georgian women smoke on a daily basis (Tobacco Atlas 2015). The World Health Organization (WHO) reports that the rate of tobacco use has since risen, with 3.8 percent of female youth 13–15 smoking daily and 7.8 percent of all females using tobacco in total (WHO 2015, 2). While Georgia has some policies in place to curb tobacco use, the policies are not widespread. For instance, Georgia has smoke-free health facilities and universities, but other

locations, such as government facilities and restaurants, are not smoke free; there is no ban on direct advertising of tobacco (Tobacco Atlas 2015). Though the government put forth smoking fines for institutions that allow smoking, those laws are not enforced in any way, nor are there protocol for following up on smoking complaints (WHO 2015, 3).

Reproductive Health and Contraceptive Use

In one study, under 30 percent of women ages 15–44 reported having a gynecological exam in the past year (Doliashvili and Buckley 2008, 24). Of women aged 18–44 who are married or cohabitating, 48.7 percent report using contraceptives, including intrauterine devices (IUDs), implants, sterilization (male and female), hormonal birth control, condoms, and other (Eeckhaut, Sweeney, and Gipson 2014, 151). Research suggests that there is an increase in modern contraceptive use in Georgia, but the increase is mostly seen in women under 25 (Westoff 2005, 6).

Georgia has the highest abortion rate in the world (Serbanescu, Stupp, and Westoff 2010, 99). A study funded by USAid showed that Georgia's abortion rate for women 15–44 was 3.7 abortions per woman and that abortions were often performed for married women who already had one or two children (Westoff 2005, 3). The UN International Covenant on Civil and Political Rights notes that abortion practices are sex-selective and are the result of unequal valuation of the sexes (United Nations 2014).

According to the Organisation for Economic Co-Operation and Development's (OECD) Social Institutions & Gender Index, there have been no reports of female genital mutilation (FGM) in Georgia (SIGI 2014).

Maternal Health

Maternal health is a particular problem for displaced Georgian women. Because of the lack of affordable health care and a lack of equipment and staffing, Georgian women experience preventable pregnancy complications. However, Georgian women saw an increase in prenatal care, from 75 percent to 90 percent, and ultrasounds in a period from 2005 to 2010 (UNICEF 2011, 32). In addition, prenatal care in Georgia now includes HIV testing, leading to higher rates of detection and treatment (36). The UNDP and Maternal Mortality Estimation give a range of maternal mortality rates from 41–66 per 100,000 live births, while the infant mortality rate is 11.7 per 1,000 live births (32).

From 1999 to 2010, Georgia saw an overall increase in women delivering babies in health facilities, particularly

the Azeri population, an ethnic minority (6). However, one of the leading causes of death for children under five years old is neonatal medical concerns, such as premature birth, asphyxia, infections, and pneumonia, which may be preventable and which research has demonstrated is correlated to maternal health (22).

Most Georgian women breastfeed their children at some point, but few continue to primarily breastfeed. UNICEF states that roughly half of all infants under six months old are exclusively breastfed, and the average age for weaning is 9–10 months old (26). UNICEF promotes breastfeeding to reduce cases of malnutrition in Georgian children, including anemia (25–27).

Diseases and Disorders

Georgia has a low rate of communicable diseases, including malaria, which was a problem in the early 20th century. Within Georgia, tuberculosis (TB) and HIV/AIDS are the most prevalent communicable diseases (WHO 2014). The WHO lists Georgia as 1 of the 27 countries with highly drug resistant TB, and thus it has been working with Georgia to develop better prevention measures for TB. Of particular concern and difficulty for medical providers are TB-HIV coinfections (WHO 2011).

The UN report *Convention on the Rights of the Child* notes that the rate of STDs is increasing and with it the incidence of discrimination against those with HIV/AIDS (United Nations 2008, 11–12). While Georgia has an overall low rate of HIV/AIDS, the rate of diagnosis rose by 25 percent over a decade (UNICEF 2011, 34). The rate is particularly high among young people in Georgia, possibly because of a lack of programs that would offer awareness of STDs and risks of intravenous drug use (UNICEF 2011, 7, 36).

Vaccinations

The Georgian government increased vaccination funding in an effort to reduce preventable diseases and diseases such as rotavirus and pneumonia that contribute to the infant mortality rate (UNICEF 2011, 28–29). To keep the rates of communicable diseases low, as they currently are, the WHO and other programs continue to promote vaccination for Georgian citizens and children.

Education

Education appears to be an area of equality for Georgian females. According to UNICEF, 29 percent of 6-year-old

boys and 24 percent of 6-year-old girls do not attend primary school, mostly in communities with ethnic minorities (UNICEF 2011, 17). At all levels of education, the ratio of girls to boys is fairly even, with slightly more girls attending school than boys, particularly in secondary school (17–18, 20). However, poor and ethnic minority students are more likely to drop out of secondary school, with boys dropping out at a higher rate than girls (20).

Primary, Secondary, and Tertiary Schools

Georgian schools are comprehensive, meaning they do not differentiate between academic and vocational tracks as some schools in Europe do (Chakhaia et al. 2014, 306). Georgian schools consist of several levels: primary level, lower secondary level, upper secondary level (ages 14–15), and tertiary level (ages 16–18) (308). The lower levels of education are available to all children in Georgia. The tertiary level has limited funding, and therefore some families cannot afford for their child to continue in school (308).

In 2011, Georgia implemented 12th grade certification exams that have high stakes for teachers and administrators when teachers fail (306). For this reason, students who are viewed as potentially failing are encouraged to drop out of school, and the dropout rate has increased (306–307). From October 2011 through January 2013, 7,367 girls aged 12–15 dropped out of school, with the rate of withdrawal highest in the Kvemo Kartli region and among ethnic Azerbaijani females (SIGI 2014).

Among all genders, obtaining a technical vocational education, mastering fluency in English, or acquiring working knowledge of computers increases an individual's earning potential (Habibov 2012, 215). However, technical education at the tertiary level is costly, and few students are able to afford technical education (Chakhaia et al. 2014, 306).

Postsecondary Education

A 2011 report from the government listed the levels of education for Georgian females as the following (per 1,000 Georgian women): 146 received primary education; 96 received basic education; 294 received general secondary education; 155 received vocational secondary education; 26 began but did not complete higher education; and 191 completed higher education (National Statistics Office of Georgia 2011, 24). In general education schools, male students were more likely to be enrolled in private institutions, while women were more likely to be enrolled in

private institutions of higher education (25). Similarly, in all institutions of higher education, women made up 55.5 percent of all students (26). In all fields except engineering and construction, doctoral students were mostly female in the academic years 2008 and 2009 (27).

Employment

Assessing the education of Georgian female students is difficult due to the aggregation of educational data, and thus there is a lack of understanding of the state of education for male and female students (Richmond 2009, 7–8). Due to an increase in education levels, immediately prior to their independence from the Soviet Union, Georgian women experienced an 80 percent employment rate (Hofmann and Buckley 2013, 513–514). Political unrest has led to an increase in women's employment outside of the home. Nevertheless, the rate of females working outside of the home as of 2014 was 56.5 percent, as compared to the male rate of 75.1 percent. This rate is relatively unchanged in statistics disseminated from the government in 2009 (National Statistics Office of Georgia 2011, 34). Georgian women receive 52.6 percent of all pensions within the country (21).

Political Conflict and Employment

Recent political upheaval has also increased forced migration from Georgia, particularly for women. The continued political unrest has led to an increase in divorce rates and thus a greater need female employment (Hofmann and Buckley 2013, 514). Research into Georgian migration shows that Georgia's wage rates are among the lowest of the former Soviet countries, with a minimum wage of approximately USD\$65.61 per month, leading to increased migration from Georgia as Georgians search for higher pay (Koshulko and Onkal 2015, 122–123).

Gender Dynamics in the Employment Sector

Despite an increase of women in the workforce, being female in Georgia has the highest negative impact on income amount (Habibov 2012, 215). Research found that this was due to a variety of factors, including employers being wary of hiring women who may go on maternity leave or who have to take off work to care for family members, and because women were often employed in education or health care, which are both low-wage areas and are increasingly hiring fewer women (218). The UN International Covenant on Civil and Political Rights lists the

gender wage gap as a violation of human rights in Georgia and suggests eliminating gender discrimination in hiring and employment practices (United Nations 2014).

Among private local, private foreign, and state employers, there is greater gender equality in employment at the state level, with nearly 50 percent female employment, than in the other two sectors, both of which experience a female employment rate of less than 40 percent (National Statistics Office of Georgia 2011, 53). However, at all levels, females in Georgia are paid on average approximately 100 GEL (\$41.71 US) less than male employees (44).

Gender inequality exists within the promotion hierarchy, too. In institutes of higher education, Georgian women were more likely to be employed as teachers or assistant professors but less likely to be employed as full professors in the 2009–2010 academic year (26).

Maternity Leave

As of 2013, women in Georgia can take 477 days off for maternity leave, and 126 of those days are paid (Gvedashvili 2013). Though women have requested higher pay for reforms that do not allow employers to lay off women before they go on maternity leave, there is little indication that those reforms passed the Georgian Parliament.

Family Life

Because of conflicts and internal displacement, family life has changed significantly since Georgia's independence from Russia. Aspects of employment, mentioned above, challenge the patriarchal nature of Georgian family life.

There is little information available on the status of lesbian, gay, bisexual, transgender, and queer (LGBTQ) women in Georgia, likely due to the overall lack of acceptance of LGBTQ persons by the Georgian Orthodox Church and Georgian society.

Marriage

The minimum marriage age in Georgia is 18 years old, but the age restriction is not enforced, as is evident from an increasing number of earlier marriages, likely due to poverty and premarital sex. Girls and women in Georgia are expected to be virgins prior to marriage (SIGI 2014).

Fertility Rate

As of 2014, Georgia's fertility rate is 1.6, lower than the United States, Australia, and France (Eeckhaut, Sweeney,

and Gipson 2014, 150). The UNDP estimates the adolescent birth rate (women ages 15–19) at 46.8 births per 1,000 births (2015). The fertility rate may be inaccurate; many births go unregistered, particularly in ethnic minority communities. Georgia has sought to increase the number of children who are registered at birth, thereby helping to ensure access to health and education. The number of infants registered rose from 92 percent in 2005 to 97 percent in 2010 due to outreach targeting ethnic minorities who were less likely to register infants (UNICEF 2011, 56).

Household Roles

Georgia's gender traditions remain paternalistic, with males viewed as the breadwinners and women viewed within the domain of the home (Kabachink et al. 2013, 780–781). Research released in 2001 indicates that only one-third of households in Georgia consider a woman to be the head of the house (National Statistics Office of Georgia 2011, 29). The UN International Covenant on Civil and Political Rights urges political leaders to address the paternalistic aspects of society by raising awareness of equal rights for women (United Nations 2014).

Despite the majority of Georgians viewing men as the head of the household, both men and women share paternal authority, including decision making, in their marriage, and this shared parental role continues even when parents divorce. Along the same lines, women can petition for a divorce, but a man cannot petition for a divorce if his wife is pregnant or he has a child under a year old (SIGI 2014).

One report notes that despite the paternalistic society, younger Georgian men are taking on more of the unpaid work, such as child care and household work, likely due to higher rates of unemployment, but another report found that gender roles remain strongly linked to gender (SIGI 2014). Despite a shift in the nature of household work, Georgian women may lack resources that grant them autonomy. As of 2010, women are issued less than 15 percent of all driver's licenses issued in the country and own less than 13 percent of the vehicles (National Statistics Office of Georgia 2011, 61–62).

Property Rights

Despite having equal rights to inheritance, male children are often given property to the exclusion of female children (SIGI 2014). Legally and through government mandate, male and female citizens have equal rights to property and land, and upon marriage, a woman retains rights to her property.

Politics

Women's groups in Georgia appear to be growing in number. The NGO Stop Violence against Women says that the Anti-Violence Network of Georgia, the Georgian Young Lawyers' Association, the Women's Center, Women for Democracy, and other organizations are all working to achieve equality in Georgia (Advocates for Human Rights 2008).

Participation in the Government

Historically, women have held few positions within the Georgian Parliament, with only 6.4 percent of Parliament seats held by women in 2010 (National Statistics Office of Georgia 2011, 63). Women hold only 11.3 percent of political seats in the government (63). As of 2009, no minority women were in the Georgian Parliament (Richmond 2009, 5). However, women have nearly equal representation as judges on the High Council of Justice, with 106 female judges out of the 217 total judges in December 2010 (National Statistics Office of Georgia 2011, 65). The UN International Covenant on Civil and Political Rights lists the underrepresentation of women in government as a human rights violation (United Nations 2014).

LGBTQ Rights

Georgian society has little acceptance of those in the LGBTQ community. Homosexuality is viewed as unacceptable in Georgia, with 90 percent of the population stating no tolerance for homosexuality and the other 10 percent refusing to answer or answering that they do not know (Filetti 2014, 232). In May 2013, a march against homophobia in the Georgian capital of Tbilisi resulted in rioting, with priests from the Georgian Orthodox Church participating, and had to be broken up by police officers (Zhvania 2013). The UN International Covenant on Civil and Political Rights notes discrimination, hate speech, and violence toward Georgians who identify as LGBTQ (United Nations 2014). The United Nations recommends prosecution of those found to discriminate against or act in violence toward members of the LGBTQ community (United Nations 2014).

Religious and Cultural Roles

A 2014 study on Georgian religion identified 10 percent of the population, mostly ethnic minorities, as Muslim; 85 percent as Orthodox Christian; and 3 percent agnostic

(Filetti 2014, 224). The large number of Orthodox Christians means that the country is conservative in its views, as has been noted above in sections on premarital sex and patriarchal roles for men and women. Orthodox Christianity has a strong influence over the daily lives of Georgians and receives government funding each year of USD\$12.5 million (Popovaite 2015). Orthodox churches require women to cover their heads while in church.

Muslim women in Georgia, because they are in the minority and because of a Georgian history of defending Georgia from the Muslim armies of the Ottoman and Persian Empires, may be shunned or lose employment. Muslims are unfavorably viewed in Georgia and seen as less intelligent, and some Muslim women refrain from covering their hair in public so they can blend in with the non-Muslim population (Popovaite 2015).

Issues

Though not much is known about the lives of minor girls in Georgia, the status of Georgian women speaks to what Georgian girls can expect when they become adult women. Educational opportunity seems equal among Georgian girls and boys, and there is a high literacy rate. However, women are less likely to be employed and, if they are employed, promoted to the same level as their male counterparts and make the same pay. Women also experience workplace sexual harassment and discrimination. Women in Georgia also experience domestic violence and human trafficking.

Issues Related to Employment

In the U.S. Department of State's 2012 human rights report, workplace sexual harassment and discrimination are problems that Georgian women face. Specifically, sexual harassment is not illegal in Georgia, and so there is no outlet for reporting incidents of harassment. Additionally, little is known about discrimination because NGOs in Georgia believe discrimination is underreported; however, data shows that women work in lower-level positions than men, even when they have the same skill set and education level, and women make 60 percent of what their male counterparts make (U.S. Department of State 2012).

Domestic Violence

Statistics released by the Georgian government indicate that men are the most likely perpetrators of violence, and

women are most often the victims of violence (National Statistics Office of Georgia 2011, 59). Corporal punishment of children and women is not illegal in Georgia. As of 2011, there were only two shelters for mothers and their babies in the country, and violence is one of the factors for which shelters accept women (UNICEF 2011, 50). The UN report on the International Covenant on Civil and Political Rights asks Georgian leaders to protect women from domestic violence by providing rights awareness, shelters, social workers, and by raising awareness throughout the country, but also by using legislation to further penalize and criminalize corporal punishment (United Nations 2014).

Trafficking

The U.S. Department of State *Trafficking in Persons Report* claims, "Georgia is a source, transit, and destination country for women and girls subjected to sex trafficking," including in tourist areas. Women and children are also trafficked for forced labor, particularly in agriculture, construction, and domestic service (U.S. Department of State 2015).

Gender Preference

Gender discrimination is present in many facets of Georgian life. Parents prefer male children to female, and as a result, Georgia experiences a high rate of prenatal gender-selective abortions (Liisanantti and Beese 2012, 26). Men are largely viewed as the breadwinner and decision maker within a family (Filetti 2014, 231).

Grassroots Movements

In January 2015, with the support of UN Women, Georgian president George Margvelashvili declared 2015 the Year of Women. Erika Kvapilova, the president and UN Women representative in Georgia, spoke of the need to eliminate violence against women while also promoting women's rights, representation within the government, and employment equality for women (UN Women 2015).

(Federal Republic of Germany) written in white letters mark the border between Germany and its neighboring countries. Border controls no longer exist on land. Only German airports and seaports with connections to countries outside the Schengen Area still maintain border control.

Germany is approximately 137,850 square miles, roughly the size of the state of Montana, and has a population of slightly more than 82 million people (FSO 2017b). Seventy-four percent live in urbanized areas. Berlin has 3.4 million residents, Hamburg has 1.8 million, and Munich has 1.3 million. Ninety-two percent of the population is German, 2.4 percent is Turkish, and the remainder consists of a mix of predominantly Greek, Italian, Russian, Polish, Spanish, and Serbo-Croatian ethnic groups (CIA 2017). German is the official language; more than 95 percent of the country speaks a regional German dialect as their first language. Germany has a national version of Braille (*Deutsche Blindenschrift*) and its own sign language. The *Deutsche Gebärdensprache* (German Sign Language) is used by an estimated 50,000 people (Fischer and Lane 1992).

The first German Empire was formed in 1871. Monarchs of hundreds of smaller and larger entities gathered in Versailles to proclaim the Prussian king Wilhelm I the first German emperor. After the end of World War I, in 1918, the first German democracy, called the Weimar Republic, after the Thuringia city in which the national assembly gathered for the first time, replaced the monarchy, albeit only for a brief period. In 1933, the National Socialists were voted the strongest party of the German parliament and by ways of introducing new laws turned the country into a one-party dictatorship of the National Socialists, led by Adolf Hitler.

After Germany surrendered in World War II, in 1945, it was divided into four parts under Allied governance. The American-, British-, and French-occupied zones transformed into 11 states (*Bundesländer* or *Länder*, for short) and formed the Federal Republic of Germany in 1949 (West Germany). The Soviet-occupied zone became the German Democratic Republic (East Germany) in the same year. The former German capital, Berlin, situated in the Soviet-occupied zone, was also divided into four sectors, which became West Berlin and East Berlin. The West German capital moved to the provincial Bonn on the Rhine River, and the East German capital remained Berlin (East).

While West Germany became a prosperous country, aided by the United States, East Germany stagnated economically under the centralized socialist economy, causing many East Germans to leave the country. In 1961, East

Germany

Overview of Country

The Federal Republic of Germany is situated in Central Europe. It borders nine countries; starting in the north and moving clockwise, they are Denmark, Poland, the Czech Republic, Austria, Switzerland, France, Luxemburg, Belgium, and the Netherlands. As all of Germany's current neighbors are members of the European Union and the Schengen Area, a political conglomerate of nations that allows free movement across the borders of its members, or are covered by a special treaty in the case of Switzerland, there are no longer any border fortifications separating Germany from these nine countries. Instead, square blue signs bearing a circle of 12 yellow stars (the European flag) that enclose the name "Bundesrepublik Deutschland"

Germany began to build the Inner-German Border, better known as the Berlin Wall. It was 866 miles long and had an intricate border control system that consisted of barbed-wire fences, guard towers, minefields, booby traps, and antivehicle ditches. Eventually, in 1989, the wall came down, and in 1990, East and West Germany “unified.” Since then, Germany has been undergoing a complicated process of integrating 17 million East Germans into the old Federal Republic (Lonely Planet 2017).

The life expectancy of Germans is about 80.4 years. Women live 82.9 years on average, surviving men by more than four years (78.2 years). Currently, there are slightly more women than men in Germany, with a female-to-male ratio of 1.04. With a fertility rate of only 1.43 children per family and a birth rate of about 8.5 births per 1,000 people, compared to 11.3 deaths (CIA 2017), Germany’s population is declining. Women in Germany are almost 29 years old at the time they give birth for the first time. There is an even stronger decline in the number of pregnancies in nonurban areas compared to cities (Ehrenstein 2012). Overall, there are only about 650,000 births per year. The reason for a still somewhat steady number of residents in Germany is the increasing migration of families with more than two children. Given that, in 2013, 20 percent of the people were immigrants, one can conclude that the population of Germany would shrink more rapidly without immigrant women (FSO 2017a). An end to this trend is not in sight.

Immigration is the biggest factor that has changed Germany’s ethnic configuration since the 1950s, with the advent of guest workers, since the 1990s, with the influx of ethnic Germans from behind the Iron Curtain, and since 2015, with the opening of Germany’s borders to refugees. For Germany, a definition of ethnic diversity is only possible by linguistic origin, as many European countries do not keep track of ethnicity. Thus, there are only estimated numbers for people of color. An estimated 300,000–500,000 people of color live in Germany whose interests are represented by the *Initiative Schwarze Menschen in Deutschland* (Black People Initiative Germany), making people of color still a rather uncommon sight, particularly outside the major cities (ISD 2014). This changed drastically, when Germany announced the opening of its borders to millions of refugees, and assigned them even to small communities according to a predetermined percentage allotment. Most Germans are of Central European descent. Out of the 83 million residents of Germany, approximately 3.2 million are Turkish, 3 million are Russian, 1.8 million are Polish,

1.5 million are from the former Yugoslavia, 800,000 are Italians, and 500,000 are Romanians (CIA 2017). Germany also accepted approximately 600,000 Syrian refugees since 2014. Marriages and partnerships between ethnic groups have increased over the last decade, turning the country into a more heterogeneous and multiethnic society, despite occasional claims of the failure of *multikulti*, in the German vernacular (Angelos 2011).

This shift in ethnicities is also one of the reasons that the composition of religions in Germany is undergoing a substantial change. During the Holy Roman Empire, one of modern Germany’s predecessors, Roman Catholicism was the sole religion. This changed with the Reformation, when Martin Luther proclaimed the need for reform within Christianity. As a result, most states and principalities in northern and central Germany turned Protestant, consisting of mainly Lutherans and some Calvinists, while southern Germany remained largely Catholic. At that time, people’s religion was determined by the religion of the principality’s ruler, according to the principle *cuius region, eius religio* (whose realm, his religion), but limited to Catholicism and Lutheranism. Germany’s constitution in 1919 eventually guaranteed the freedom of religion, something that was adopted in the Basic Law of 1949 (the name of Germany’s constitution).

Overview of Women’s Lives

In 2005, a historic event took place in the Federal Republic of Germany. For the first time in the country’s 56-year-old history, a woman was elected to the country’s highest office. Angela Merkel, chairperson of the conservative Christian Democratic Union (CDU), became Germany’s first female chancellor, de facto head of state, leader of the German government, and the supreme commander of the German military in case of a state of defense. Germany has embraced a strong woman at its helm since then, and the term of endearment “*Mutti der Nation*” (Mommy of the Nation) bestowed to Merkel by the German press indicates how the country now identifies and relies on the leadership of a woman. Under Merkel’s guidance, Germany has not only weathered the most recent economic downturns, but it has become Europe’s economic powerhouse while making progress toward gender equality. Globally, Germany ranks fourth in terms of its economy and sixth in the Gender Inequality Index (GII) (UNDP 2013). Although it is not evident that there is a direct correlation between Germany’s gender politics and the economy, it is safe to

assert that Merkel's leadership has brought attention to a wide variety of women's issues in Germany.

Germany's division into East and West Germany between 1949 and 1990 is the reason that, to this day, the eastern part of Germany is more secularized than the western part. In West Germany, religion played an integral part in the rebuilding after the war. The Catholic and the Lutheran Churches emphasized the traditional family as an integral element, as evidenced by the founding of the two parties, CDU (*Christlich-Demokratische Union*; Christian Democratic Union) in 1945, by members of the Catholic Centre Party and Lutherans, and the Bavarian-only CSU (*Christlich-Soziale Union*; Christian Social Union), also in 1945. West Germany's economic success and swift rebuilding after the war was thus also a win for the two churches and their patriarchal structure—even in the Lutheran Church that up to this day has fewer than 40 percent of its positions occupied by women.

In communist East Germany, churches were tolerated, but they were not supported by the government. In fact, East Germany instituted a secular coming-of-age ritual to replace the religious ceremonies of confirmation in the Christian churches. The *Jugendweihe* was started in 1955 and became a political tradition in 1958, with the intention of secularizing East German society. Indeed, many East Germans did not associate themselves with religion at all. Even in the late 1980s, when East German churches became political spaces and offered room for a growing democracy movement, people did not flock to churches for political reasons.

Since German unification, more and more Germans are leaving churches, and only for a short period after 2005, when the German cardinal Joseph Ratzinger was elected pope of the Catholic Church and caused a brief uptick in numbers, official religious affiliation has decreased. Overall, however, Germany is still a country permeated by the religious influences of the two main churches.

Girls and Teens

Because of the demographic changes and the fact that almost 25 percent of the teenagers in Germany have a diverse family background, with their parents or grandparents having immigrated to Germany, the lives of girls and teenagers are difficult to generalize. Perhaps this lack of generalization is most striking because the difference one observes between German girls and teens and those with a "migration background"—a term used in Germany

to describe those 25 percent—indicates two things. First, girls and female teenagers are disadvantaged over their male peers. Second, a migration background disadvantages girls and female teens further, as established patriarchal structures position and solidify the girls in those structures, often against their will. For those reasons, separating German girls and girls with a migration background is a troublesome necessity because there is a clear distinction at all levels of German society. In general, girls, teens, and women with a migration background have a more difficult life.

Education

According to a study conducted for Ursula von der Leyen, more gender equality is essential for the future of Germany (von der Leyen 2013). Nevertheless, at present, more girls leave German schools with a diploma than their male counterparts. In 2014, 5.6 percent of German girls and 12.9 percent of girls with a migration background did not graduate, compared to 9.5 percent of German boys and 19.7 percent of boys with a migration background. Almost 35 percent of German girls and 10.3 percent of girls with a migration background received a degree that allowed them to attend college (compared to 26.3% of German boys and 8.1% of boys with a migration background) (OECD 2014).

As schooling is compulsory until the equivalent of the eighth grade in the United States, and homeschooling is illegal in Germany, each girl is guaranteed a basic education that requires interaction in a social setting with children of all genders. Most schooling is done at public schools, which are governed by the laws of each state. Private schools also have to adhere to these laws and are only allowed to charge modest tuition to avoid segregation by social status. Most schools are coed schools, but schools that are exclusively for girls do exist, especially at the secondary level. At those schools, girls have shown more interest in the sciences due to the lack of gender stereotyping that is often the case at mixed schools (Expatica 2017).

The infrastructure thus theoretically enables all girls to graduate with a diploma, enabling them to attend college. In reality, girls, particularly with a migration background, are often discouraged to attend secondary schools beyond the requirement, especially when their cultural roots require them to occupy traditional gender roles within their families. The German government started to address these issues with special projects and programs offered to girls with a migration background, such as free computer

courses, mentoring by successful women from migration backgrounds, and support networks.

The statistics that show the low percentage of women with migration backgrounds receiving a degree that qualifies them to attend college have further implications. While the overall percentage of female students has been hovering around 47 percent since 2005, most of them come from families without migration backgrounds, making college education still largely unattainable for some girls due to sociocultural considerations (BPB 2014). Socioeconomic factors only play a small role, as studying at German universities is tuition free or bears only a nominal fee and students generally qualify for low-interest student loans to cover some of their living expenses. Cultural barriers, going back to the patriarchal system of many minority cultures, prevent an increase in better education, at least for the moment.

Employment

Sixty-eight percent of German women are employed at least part-time (compared to a 78% employment rate for men) (OECD Better Life Index 2014). As in many other areas for women in Germany, a migration background complicates life. Almost one-third of all unemployed women come from a family of immigrants.

Overall, more women work part-time than men and earn less on average than their male counterparts, and they still generally juggle housework and caring for the children on top of their day jobs. This often makes the pursuit of a full-time position impossible. In particular, when children who have not yet reached school age are involved, the lack of adequate child care (only one space for three children) and having half-day kindergarten coupled with the expectation of a male breadwinner and the female homemaker have posed major problems for women interested in joining the workforce. Conditions have improved for women, but one can still observe a large gap between women and men (OECD Better Life Index 2014).

Historically, this was different. Before 1990, East Germany led the way over West Germany in providing day care options for women to allow more of them to work. In the 1980s, almost 80 percent of East German women had a job outside the home. This changed with unification in 1990, when droves of East Germans, particularly women, became unemployed (OECD Better Life Index 2014).

Theoretically, women in Germany have access to any job. By law, women cannot be excluded from any career option

and are, at least on paper, to be treated equally to men. This legislation originated in East Germany. During the time of division, from 1945 to 1990, East Germany promoted gender equality and supported women entering “traditional” male occupations, such as engineering, while West German women still needed the permission of their husbands to pursue work at all (Labor Market Reporting 2015).

Nowadays, women work in blue-collar and white-collar jobs, and they are increasingly pursuing traditionally male professions, such as car mechanics. In some manufacturing jobs that have a three-shift rotation, women are excluded from night shifts. Job ads have to be published using gender-neutral language, either by advertising the position with male and female word forms or by stating in parentheses that the position is open to both genders. As an example, a search for a police officer would state “Polizist/Polizistin” (with the suffix “in” indicating the female gender) or “Polizist (m/w)” (the letter “m” standing for male or *männlich* and the letter “w” for female or *weiblich*).

Although more women than in the past may have been pursuing traditionally male jobs, most women still work in the service sector. The most popular jobs for women in 2013 were management assistant (secretary), followed by nurse practitioner, hairstylist, and dental hygienist (Labor Market Reporting 2015). Most of these jobs only require vocational school and apprenticeships, starting at age 15 or 16. Virtually all girls without a migration background either receive job training or pursue a comprehensive school degree.

Despite equal language and antidiscrimination laws based on gender, there are still significant and crucial differences between women and men in many areas of employment. For instance, the gender pay gap is still large, at 22 percent, despite the same or similar qualifications of women (Statista 2014). In eastern Germany, women receive lower pay on average than women in western Germany, but as wages in the eastern states are generally lower than in the western states, the gender pay gap there is only 8 percent due to generally lower wages and the previous history of women working in traditionally male jobs in East Germany (Statista 2017b). The few women who are CEOs or in leading roles receive lower pay than their male counterparts at other companies.

In 2007, an all-female business network for women, Generation CEO (with the letter O replaced by the symbol for Venus), was founded to address and improve the situation (CEO Generation 2017). In 2014, the network boasted more than 140 female members, many of them in

leading positions in large German companies. This change, along with the increase of women in politics, indicates that Germany is working on further progress toward gender equality. At the same time, even a recent law from 2014 that requires companies to introduce a gender quota for women in leading positions is not expected to change gender inequity soon.

Family Life

The sexual revolution of the 1960s changed family roles for girls and young women, at least for those with a non-migration background. During the time of Nazi rule, from 1933 to 1945, women were expected to give birth and take care of the household. This notion of the man as breadwinner and the woman as homemaker continued in postwar Germany and in the years to follow; in fact, in West Germany, women still needed written permission from their husbands to pursue work outside the house until 1957, and it took until 1977 to completely abolish this law (Erdmann 2012). In East Germany, on the other hand, women were considered equals from the very beginning of the country's founding in 1949, and they were not limited to the traditional gender roles in the family.

In 2017, girls are no longer expected to learn mending and cooking, but most children, regardless of gender, have rotating chores, such as loading the dishwasher, setting the table, taking out trash and recycling bags, going grocery shopping, and even cooking and picking up a younger sibling from day care. Even though girls are not expected to be only homemakers, many girls learn to run a household, but for more practical reasons, as school days in Germany used to end around 1:00 p.m. and parents often worked until 6:00 p.m.

In families with migration backgrounds, girls are still expected to follow the traditional role of learning how to be a homemaker. Unlike their peers, these girls do not receive schooling longer than the time required by law. They assist their mother and sisters at home, serving their father, brothers, and other male family members. At a young age, they are conditioned for their future destiny as housewives, representing a model that is disappearing otherwise, as more and more girls without migration backgrounds go on to have careers and a family.

For most families in Germany, family life is that of a First-World family, but often still with rather traditional gender roles. In 2012, there were 387,000 marriages (Germany signed a law to allow same-sex marriage in 2017);

674,000 children were born; and 870,000 people died. The average age of women at the time of marriage was 30.5 years, with a tendency upward. Almost 35 percent of marriages will end with divorce eventually (Statista 2017a).

One of the most striking statistics about Germany is that of a low birth rate. In Germany, only 1.38 children are born per couple. Germany's population would be decreasing dramatically if not for immigration and families with migration backgrounds who keep the population stable. The low birth rate also suggests that many women give birth rather late and have only one child, or forego having children altogether (CIA 2017).

The low birth rate and an increase in the number of women not getting married also tell another story—one of a society with independent women who no longer need to rely on marriage or partnership (Destatis 2012). This may not always be the case for women with migration backgrounds. They marry earlier and have more children. Sometimes, these marriages are arranged by the woman's parents. On occasion, women are married, or at least “promised,” while they are still minors, a practice that is not acceptable or legal in Germany.

The state supports raising children with financial incentives such as *Kindergeld* (child allowance), *Elterngeld* (parental allowance), *Betreuungsgeld* (child care subsidy), and *Mutterschutz* (paid maternity leave). The child allowance was started under the Nazis as an incentive to give birth to Aryan children. After the war, the incentives were continued as a way to help with the costs families incur for raising children. In 2014, families received USD\$194 each for the first and the second child, USD\$200 for the third, and USD\$227 for each subsequent child.

Pregnant women cannot be fired from their jobs due to pregnancy and are protected by a number of laws that guarantee them paid leave six weeks before their due date and eight weeks after giving birth, during which time they receive their full salary. The expecting mother cannot be replaced and has a right to return to the same work during that time. Yet, despite these incentives and the opportunity to have both a career and children, many women have decided not to become mothers, as much of the work associated with raising a child falls back to the women. Working mothers thus face a triple workload of their job, raising the children, and caring for the household. A stark gender imbalance still exists in Germany.

Despite the gender imbalance and a still prevailing expectation of women to be mothers and housewives in addition to having jobs, the tendency of having fewer babies

later in life suggests something positive: most women control their sexuality. German women are sexually active earlier than their peers with a migration background. By age 17, more than 67 percent of German teenagers have had intercourse. Teachers and friends, not parents, are the main source of sex education (Spiegel Online 2006).

The use of contraceptives is well established among teenagers and adults alike, partially due to general mandatory sex education in school biology courses, but also because of easy access to contraceptives in pharmacies, stores, and even from vending machines located in public restrooms. Only 6 percent of all teenagers do not use contraceptives at all, which is one reason why the number of teenage pregnancies is fairly low. Girls older than 14 can receive a prescription for the pill from a gynecologist even without their parents' knowledge. Many teenagers use a combination of the pill and condoms, whereas women largely rely on the pill to prevent pregnancies (Spiegel Online 2006).

In Germany, sexual activity after the age of 14 is not prosecuted if it is consensual, regardless of whether the sexual activity is between minors or between minors and adults. An exception is the exchange of money for sex. Prostitution is legal in Germany, but only between adults. The legalization of prostitution has caused problems with sex trafficking of young women. Southeast Asians and Eastern Europeans are brought to Germany and forced to work in brothels, often without access to condoms, or perform what has become known as "flat-rate sex" (Spiegel 2013).

Politics

On paper, German women have the same rights as men when it comes to participation in German politics. In 1949, West Germany's Basic Law, the equivalent of a German constitution, which is still in place today, codified gender equality in paragraph 3 with the statement, "Men and women are equal before the law." Already 30 years before, on November 12, 1918, the law had been ratified that allowed German women to vote and be elected for office, and only 18 days later, the law was put in place, just in time for the federal elections on January 19, 1919. More than 300 women ran for candidacy, and, eventually, 37 women were elected to become a part of the national assembly of 423 members.

In comparison, the German parliament in the year 2014 had 230 women out of the 631 members—a quota of 36.5

percent, ranking it 21st in countries with the highest percentage of women in parliament (Weiser 2017). Two of its four political parties currently represented in the parliament have more women than men, *Bündnis 90/Die Grünen* (Green Party) with 54 percent and *Die Linke* (Left Party) with 56 percent. The SPD (Social Democrats) have 45 percent, and the CDU/CSU (Christian Parties) have a mere 25 percent. The Green Party and the Left Party instituted an official quota of at least 50 percent women in all positions and with the advantage in tiebreaker cases, while the Social Democrats have a quota of 40 percent. The Christian Democrats only have a "Women quorum," suggesting a quota of 33 percent of women (Expatica 2016).

However, in 2014, more women than men were in leading positions in their political parties and the three branches of the German government. Women held the following roles: the position as chancellor (the de facto head of Germany), Angela Merkel; the position of the president of the Federal Court (*Bundesgerichtshof*, or BGH), Bettina Limperg; four of the seven positions in the federal assembly (*Bundestag*); 15 of the 30 members of the Council of Elders in the federal assembly (*Ältestenrat*); and 5 of the 15 secretaries in the federal government (*Bundesministerien*). The BGH currently has 26 female judges (including one formerly transgender judge, Johanna Schmidt-Räntsch, who recently completed surgery to become a woman) out of a total of 130, making the quota 20 percent.

Compared to the situation at the turn of the millennium, Germany has progressed rapidly, and women are still on the rise in politics. The only position never occupied by a woman is that of the federal president, the ceremonial head of state of Germany. In East Germany, the last acting head of state from April 5 to October 2, 1990, was a woman, Sabine Bergmann-Pohl. In 2004 and 2009, Gesine Schwan ran for the office, but she was defeated twice. At the state level, only 4 of Germany's 16 states, North Rhine-Westphalia, Rhineland-Palatinate, Saarland, and Thuringia, had women as minister-presidents in 2014.

Due to this lingering underrepresentation of women in politics, men still largely dominate discussions and decisions concerning the legislation of women's rights. Current law prohibits abortion; it is punishable by prison in accordance with Section 218 of the penal code. In reality, a number of exceptions to the law allow the termination of a pregnancy. The law permits abortion within the first three months of the pregnancy (*Fristenlösung*), and there are also exceptions due to medical or criminal reasons. A threat to the health of the expecting mother or a pregnancy

due to rape exempt the woman and the medical personnel performing the abortion from punishment.

Religious and Cultural Roles

Religion

Officially, there is a separation of church and state in Germany; yet, a number of procedures, practices, and state laws seem to indicate otherwise. For instance, a “church tax” (*Kirchensteuer*) to finance the acknowledged churches in Germany is gathered annually using the federal income tax return. The limitation of this tax to “statutory corporations,” that is, gaining the status of an officially acknowledged church by the German states that essentially guarantees the freedom of religious practice, shows the strong ties between church and state and the relative validity of the 1919 law. Recent public debates about the role of the crucifix in Bavaria’s classrooms and the legality of teachers wearing head scarves while teaching denote further secular influence on religion in Germany. For instance, each classroom in Bavaria features a crucifix by default, instituted by a Bavarian law from 1995 to circumvent a decision earlier that year by the Federal Constitutional Court that declared crucifixes illegal in accordance with Germany’s Basic Law. The new Bavarian law refers to the history and dominant Western culture as premise for this decision. In individual cases, a school principal has the authority to either remove the crucifix upon complaint or to retain it.

In the Head Scarf Judgment from 2003, the Federal Constitutional Court granted each German state the freedom to deny employment to future teachers displaying “religious opinion.” The Muslim future teacher Fereshta Ludin had refused to remove her head scarf in the classroom and was denied a permanent teaching position for a lack of “personal aptitude.” She sued at the administrative court (*Verwaltungsgericht*) in Stuttgart, then at the Higher Administrative Court (*Verwaltungsgerichtshof*) in the state of Baden-Württemberg, and finally at the Federal Constitutional Court, losing all three times. In a reaction to the decision, many German states ratified new laws that regulate (most often to forbid) wearing “religiously motivated” garb. Despite these laws, the habits of nuns and monks teaching at German public schools are allowed (Dearden 2016).

Christianity is the de facto state religion, even though no state religion exists, with 30.2 percent of the population belonging to Catholicism and 29.2 percent to Lutheranism. Between 3.8 million and 4.3 million residents are Muslims, 13 million are orthodox, and only 100,000 are

Jews—the latter low number was caused by the genocide committed by the Nazi regime between 1933 and 1945 that decimated the German Jewish community of originally over 550,000 (DIK 2017; CCJG 2017). Jehovah’s Witnesses (*Zeugen Jehovas*) are fewer than 200,000 members, and they only recently achieved the status of a statutory corporation in most German states. The Church of Jesus Christ of Latter-day Saints (*Kirche Jesu Christi der Heiligen der Letzten Tage*) has about 39,000 members, but it has only become a statutory corporation in the states of Berlin and Hesse. And the Church of Scientology (*Scientology-Kirche*) is only considered a registered association (*eingetragener Verein*) and has been under surveillance by the Federal Office for the Protection of the Constitution (*Bundesamt für Verfassungsschutz*) for suspicion of threatening the democratic system of the Federal Republic of Germany (Berlin.de 2017; Mormon Newsroom 2017; BfV 2017).

With religion dominated by patriarchal Judeo-Christian traditions, German women have only influential roles in the few religions allowing women to occupy such roles. For Germany, in particular, they are restricted to participation in religious services in Catholicism, but they cannot be clerics. Up to this day, women can only aid priests if they are part of a Catholic order, and only since the 1990s can they serve as altar girls. Lutheran women have a more diverse array of opportunities for participation and leadership. The Lutheran Church of Germany (*Evangelische Kirche in Deutschland*) allows the ordination of women. In 1992, Maria Jepsen became the first female bishop, and in 2009, the leaders of the EKD elected Margot Käßmann as their first female president (*Ratsvorsitzende*). However, despite this, ordained women are in the minority, even in the Lutheran church.

Culture

Germany’s cultural life features a substantial number of women in theater, film, music, and literature—but often not in leading positions. For example, of Germany’s 76 opera houses, men manage 72 of them. The German film industry is much the same. Films are still predominantly directed and produced by men, while women act or work as makeup artists or costume designers. Notable and successful exceptions are contemporary female directors such as Dorris Dörrie, Katja von Garnier, and Margarete von Trotta, who have been staples of German cinema for more than 20 years.

In literature, German women have had considerable impact for centuries. Contemporary women authors

sometimes write for women and sometimes for general audiences. Names such as Julia Franck, Elfriede Jelinek, Emine Özdamar, Verena Stefan, and Julie Zeh regularly publish best sellers.

The arguably best-known German woman in the context of sexuality is Beate Uhse, a pilot in Nazi Germany's air force during World War II. After the war, Uhse was no longer allowed to fly, so she sold a brochure about sexual hygiene and contraception through the mail (Heineman 2011). A few years later, she added condoms and books, and in 1962, Uhse opened the first sex store in the world in Flensburg, Germany. The chain now comprises more than 200 shops in 7 European countries, and its stock is traded on the German stock market.

Issues

As in many other areas of women's lives in Germany, the most pressing issues differ depending on their migration background. Those with a migration background are more affected by serious issues than their peers without such a background. For instance, violence committed by male family members due to religious beliefs, such as beatings or "honor" killings of the women, rarely happen in families without a migration background. Violence against women is omnipresent, however, with domestic violence still a problem. Until 1997, marital rape was not considered a felony and was generally not even considered a violation of the law until the Bundestag voted in favor of women's rights. Sexual violence in general is a pressing issue. More than 8 percent of all women will report being victims of sexual violence at some point in their lives, and many more cases will go unreported. In 2013, approximately 7,200 rapes were reported, according to official police statistics. In 2014, the case of Tuğçe Albayrak made international headlines. The young German-Turkish woman had helped two girls who were being assaulted by a group of young men in the restroom of a dance club. When Tuğçe left the club, she was hit by one of the men and beaten to death in the parking lot while bystanders looked on (Huggler 2014).

Sexual exploitation in Germany is a big issue, too. Although prostitution is legal, many of Germany's female sex workers are victims of sex trafficking who have been lured to Germany from Eastern Europe under false promises.

Germany's beauty standards are largely those of the United States, determined by the media and their notion of an "ideal" body. These perceptions are reinforced by women's magazines that regularly introduce their readers to the latest

diet craze and fashion and swimwear presented by models with "perfect" bodies. Many girls and women are thus also subject to illnesses and unhealthy behavior, such as bulimia, bingeing, and purging, and follow the latest fitness and diet recommendations in their pursuit of these beauty standards.

Officially, German women and men are equal; yet, gender discrimination is still omnipresent in society. Salary inequity, the lack of women in leading positions, and a society that is still largely patriarchal in its structures show that things are far from perfect. In addition, the integration of women with migration backgrounds, women's rights, and strategies to encourage women to pursue jobs that were traditionally dominated by men are aspects that would improve women's lives in Germany.

Greece

Overview of Country

Surrounded by the Aegean, Ionian, and Mediterranean Seas, Greece is as well-known for its many beautiful islands as its sprawling capital city, Athens. Mainland Greece

is situated at the far south of the Balkan Peninsula and is bordered by Albania, Macedonia, and Bulgaria to the north and Turkey to the east. In part because of its location at the southeastern edge of Europe, Greece has been called a crossroads, “the place where East meets West.” Yet, European fascination with the most famous products of its ancient history—art, drama, mythology, philosophy, and democracy—also led to the characterization of Greece as “the cradle of Western civilization.”

The total land area of Greece is 50,443 square miles (130,647 sq. km), and it has 8,498 miles (13,676 km) of coastline, the most extensive of any country in the Mediterranean. Of the thousands of islands within its territory, only 227 are inhabited (Coccossis 2001). Many of these islands maintain distinct cultural identities, and there are broad differences in economic development, access to services, and means of living. As of July 2016, the total population of Greece was 10,773,253, with one-third living in the Athens metropolitan area and 78 percent living in urban parts of the country (CIA 2017). Urbanization contributed to population loss and economic decline in a majority of the Greek islands from the 1950s to the 1980s, as young people in particular left to seek education or jobs in the cities and beyond Greece. The development of tourism since the 1980s has helped revive many island economies, although traditional ways of life are waning, and some islands continue to struggle with declining population (Coccossis 2001). Greece is considered a very high human development country, based on its population’s average life span, level of education, and earnings (UNDP 2016).

Greek Debt Crisis

Greece has been a member of the European Union (EU) since 1981. In 2001, it joined the eurozone and replaced the drachma, Europe’s oldest currency, with the euro. The recession that began with the U.S. subprime mortgage fiasco and financial crisis of 2008–2009 spread to Europe and caused widespread economic decline. In 2010, Greece admitted that it was billions of euros in debt, having engaged in borrowing schemes with banks to finance development and meet eurozone membership requirements. To prevent the collapse of Greek banks and the spread of financial chaos to the rest of Europe, the European Union, the European Central Bank (ECB), and the International Monetary Fund (IMF)—known collectively as the “Troika”—agreed to a bailout of €110 billion (US \$146 billion) (Simou and Koutsogeorgou 2014). Most of the money went straight to the banks to service Greece’s debt.

In exchange for the bailout, Greece was obliged to sign a Memorandum of Economic and Financial Policies and to adopt severe austerity measures intended to reduce spending and lower its debt. These policies resulted in extreme cutbacks across the public sector. From May 2010 to May 2011, more than 80,000 jobs were eliminated, public employees’ wages were cut by 15 percent, and pensions were reduced by 10 percent (Houston et al. 2011). In May 2008, Greece’s unemployment rate was 7.3 percent; by the end of 2010, it had climbed to 14.7 percent, and at the end of 2011, it was 21.3 percent (Eurostat 2017c). In 2012, the Troika agreed to a second bailout of €130 billion (US \$170 billion) and demanded further austerity measures in return. In 2013, unemployment in Greece reached 28 percent, with youth unemployment (ages 15–24) climbing to 58 percent (Eurostat 2016).

Economic data began showing signs of progress in 2013–2014, but the economy had already contracted by 26 percent, unemployment remained high, and the weight of austerity measures had taken a deep toll on the Greek population. Suicide rates rose at alarming rates over the first four years of the crisis (Simou and Koutsogeorgou 2014), and cuts to the public sector left mental health services severely understaffed. In Europe, the average number of nurses in the mental health workforce per 100,000 population is 21.7; in Greece, the most recent data show just 3 per 100,000 (WHO 2014).

In 2015, the leftist Syriza party ran on an antiausterity platform and won the largest share of seats in the Greek Parliament. The new prime minister, Alexis Tsipras, and finance minister, Yanis Varoufakis, pledged to resist EU demands for further cuts to wages, pensions, and public services. In response to Greece’s resistance, the ECB ceased lending to Greek banks and demanded that the country sell the port of Piraeus—since ancient times, the largest and most important seaport in Greece—to repay its debt (Skarlatos 2015). With funds about to run out and Greece facing bankruptcy, the government was forced to accept even harsher terms in return for a four-month extension of the bailout (Skarlatos 2015). Several more negotiations with the IMF failed. Finally, the Troika offered another five-month extension of the second bailout, with yet another package of austerity measures attached.

Tsipras called for a national referendum on the offer and ordered banks across the country to close in the meantime to prevent a run on the euro. Fearing economic collapse, Greeks lined up at ATMs, which quickly ran out of cash. A withdrawal limit of €60 (US \$66) per individual per day was imposed, and banks remained closed for three

weeks (*Huffington Post* 2015). When the bailout expired at the end of June 2015, the Greek government was unable to make a payment of €1.5 billion (US \$1.7 billion) to the IMF, effectively defaulting on its debt. On July 5, Greeks resoundingly rejected new austerity measures in the referendum, with 61.3 percent voting “no.” Despite this strong demonstration of popular support for Syriza’s antiausterity stance, the eurozone refused to back down, and Tsipras was forced to accept a new deal with essentially the same terms that the Greek people had refused in the referendum, including more cuts to wages and pensions.

A third bailout program of up to €86 billion (US \$91 billion) was approved in August, further splitting the governing Syriza party that had already divided over austerity concessions, and Tsipras resigned the following week, calling for new elections to be held in September. On September 20, Syriza won over 35 percent of the vote, and Tsipras was reinstated as prime minister. Since then, the antiausterity government has approved multiple rafts of austerity measures. From 2010 to 2016, Greece’s creditors approved three bailouts, and in return, Greece has accepted 13 austerity packages.

Despite massive reductions in public spending, slashed pensions and wages, and soaring taxes, Greece remains heavily in debt. As of 2016, its debt had reached 180 percent of its gross domestic product (GDP), and the IMF called upon the European Union to offer Greece unconditional debt relief. But Germany, in particular, has consistently refused to consider any forgiveness of Greece’s debt. An IMF analysis concluded that without relief Greece’s debt is insurmountable; the interest payments alone would consume 60 percent of its budget by 2060 (Elliott 2016). The recession in Greece has been compared to the Great Depression in the United States, but for Greece, there is no foreseeable way out of the debt crisis. The standard of living for Greeks has plummeted since 2007, and the country now has the third-highest rate of poverty in the European Union, after Romania and Bulgaria. A Eurostat analysis found that, based on a median income anchored to the 2008 precrisis level, 48 percent of Greeks were at risk of poverty in 2015 (Eurostat 2017a).

European Migration Crisis

Greece’s location at the crossroads of Europe and Asia has subjected the country to extraordinary stresses in recent years, as hundreds of thousands of migrants and refugees from war-ravaged Syria, Iraq, Afghanistan, and elsewhere,

seeking asylum and economic opportunity in Europe, have landed on its shores. According to Frontex, more than 1 million people arrived in Europe by sea in 2015, with at least 885,000 landing in Greece. For Greek authorities, the urgency to feed, house, provide medical services, and process asylum appeals has compounded the already deepening crises triggered by the austerity measures and systemic privatizations imposed by the European Union to service the Greek debt. Waves of migrants entering Greece in hopes of reaching more prosperous nations to the north and west (e.g., Austria, Germany, Sweden, Belgium, France, and Great Britain) have found themselves detained indefinitely in Greece, as Macedonia and other Balkan nations have imposed new border restrictions to stem the flow of migrants. Northern European nations such as Germany, whose once open invitation to Syrian asylum seekers magnified the pressures of migration (Horn 2015), have, by imposing stricter immigration standards since (Czuczka 2016), increased the pressures on the very country already hobbled by financial policies determined in Brussels and Berlin. As Eva Cossé, Human Rights Watch’s (HRW) Greece specialist, observed in 2016, “Trapping asylum seekers in Greece is an unconscionable and short-sighted non-solution.” She noted the terrible irony that, even as the European Union has agreed to a relocation plan, “some countries’ actions risk turning Greece into a giant refugee camp” (HRW 2016).

Overview of Women’s Lives

In 1975, after the fall of the military junta that was in power from 1967 to 1974, Greece adopted a new constitution (*Sýntagma*), which provided a framework for the equal rights of women. Amended in 1986, 2001, and 2008, the Constitution includes multiple provisions for equal protection under the law. According to Article 4, “Greek men and women have equal rights and equal obligations,” and Article 22 states that “all workers, irrespective of sex or other distinctions, shall be entitled to equal pay for work of equal value.” Further, Article 116 stipulates, “Adoption of positive measures for promoting equality between men and women does not constitute discrimination on grounds of sex. The State shall take measures for the elimination of inequalities actually existing, in particular to the detriment of women.”

In 2015, Greece was ranked 23rd among 188 countries on the United Nations Development Programme (UNDP) Gender Inequality Index (GII; 0.119). Although Greece has

risen from 28th place in 2014, several factors contribute to inequality for Greek women. One key indicator is their level of representation in politics. Women held only 19.7 percent of the seats in the Hellenic Parliament in 2015. Other markers of gender inequality are lower achievement in education and underrepresentation in the workforce. In 2015, fewer adult women than men had reached the secondary or postsecondary levels in education, and just 43.9 percent of women, versus 60 percent of men, engaged in paid labor. Moreover, while Greek women spent half as much time as men working for pay, they spent more than twice as much time performing unpaid labor (UNDP 2016).

As noted by Karamessini and Rubery (2014), austerity policies implemented in response to the debt crisis have undermined the economic advancement of women by forcing severe cuts in public-sector employment, including education and health care—fields in which women are the majority of the workforce—and by slashing social services and welfare, including subsidized child care and maternity benefits. Moreover, the intersections of gender with ethnicity, sexual identity, age, ability, immigrant status, and so on, differentiate the experience of inequality for marginalized groups, including women with disabilities, elderly women, Roma and migrant women, and lesbian, bisexual, queer, and transgender women.

Girls and Teens

About 23.6 percent of the Greek population is under 25 years of age, with girls representing slightly less than half of the youth population (CIA 2017). The under-5 mortality rate is 5 per 1,000 live births (UNICEF 2017). The coverage rate for routine childhood immunizations is roughly 99 percent. As of 2008, Greece's National Vaccination Program includes the HPV vaccine, which is provided free of charge to females between 12 and 26 years old. The HPV vaccination, which is known to reduce the risk of cervical cancers, is available on demand from health care providers; yet, coverage rates are low. A 2010–2011 survey of college-aged women in Greece found that only 25.8 percent had received the full series of HPV vaccines (Donadiki et al. 2012).

Literacy rates for girls and young women aged 15–24 are high (99.3%) and comparable to the rate for boys and young men (99.4%) (UNICEF 2017). Since the early 1980s, girls and boys throughout Greece have had equal access to educational opportunities, although stereotypical notions

about appropriate areas of study for each gender have remained entrenched. Research on girls' and boys' attitudes toward science, technology, engineering, and mathematics (STEM) fields found that “only girls made any reference to a future family when considering their choices of subject to study at university” and that both boys and girls commonly believed that “girls are not interested in mathematics” (Ridgway and McCusker 2008).

Primary and secondary education policy in Greece is controlled by the Greek Ministry of Education and Religious Affairs, which does not mandate sex education in Greek schools. Instead, health education programs are offered and may cover a variety of topics, ranging from healthy eating habits to tobacco and drug use. Approved topics in health education include gender relations, sexually transmitted diseases (STDs), AIDS, and hepatitis B, but the introduction of these issues is optional. Most Greek children receive their first information about sex from parents and subsequently from school, friends, television, and the Internet (Vassilikou and Ioannidi 2014). Although there has been a gradual egalitarian shift, conservative attitudes toward sex and gender roles remain entrenched in Greek society, perhaps based in part on the influence of the Orthodox Church (Papaioannou 2013). Traditionally strict gender norms and attitudes about sex likely also contribute to a higher average age of sexual initiation and a lower incidence of teen pregnancy and abortion for Greek girls than in most EU countries (WHO 2009).

Education

Public education is free in Greece, and children must attend school for a minimum of nine years, from ages 6–15. About 98 percent of girls attend school through the secondary level (UNICEF 2017). Public schooling includes mandatory education in Orthodox Christianity, although students of other faiths may opt out of religious instruction (Library of Congress 2016).

Girls generally outperform boys through secondary education, earning better grades and making higher scores on exams; yet, disciplinary stratification by sex is an ongoing issue (Maloutas 2003). In a 2008 study of attitudes about gender and STEM education, Greek teachers reported that girls who performed well in mathematics were also strong in other subjects. Nevertheless, among students with strong aptitude in both STEM and arts subjects, girls were far more likely than boys to choose arts over STEM (Ridgway and McCusker 2008). The researchers interviewed

teachers and students to learn about the factors influencing girls' reluctance to pursue advanced STEM education. Half of the teachers claimed that girls and boys received equal treatment, while half reported that they made special efforts to encourage girls and boost their confidence in math. The students believed that girls spent more time studying and cared more about school than boys, but that boys were more likely to answer difficult questions and volunteer to solve problems on the board (Ridgway and McCusker 2008).

The Greek education system is divided into three levels: primary, secondary, and tertiary. Primary education includes preschool, which is optional for children aged 4–5, and primary school, which is mandatory from ages 6–11. Secondary education includes a mandatory three-year lower level, known as *Gymnasium*, for ages 12–14, and an optional three-year upper level for ages 15–17. After completing *Gymnasium*, students may choose to enter either a *Lyceum*, which is similar to high school in the United States, or a technical vocational school. At the end of secondary education, students who wish to enter tertiary (higher) education institutions must participate in a competitive national examination. There is also the option to continue vocational training at a technological education institution (Tsakoglou and Cholezas 2005).

While there is almost full participation in primary and secondary schools among Greek youth, those from minority ethnic groups, particularly Roma children, have much lower enrollment and completion rates. The social and educational exclusion of Roma is widespread in Europe. In Greece, many Roma children live in rural, remote, or ethnically segregated areas and are ghettoized in predominantly Roma schools (Georgiadis and Zisimos 2012). Several European programs have been developed to create partnerships with the Roma community and promote teacher training in intercultural education, but their implementation in Greece so far has been limited (Georgiadis and Zisimos 2012).

Another challenge to the Greek education system is the integration of migrant and refugee children. In 2016, the Syriza government led by Prime Minister Alexis Tsipras announced that Greek schools would be opened to the children of thousands of families left stranded in Greece when the migration route to Western Europe was closed. While many parents and teachers across Greece welcomed the new students with small gifts and candy, some responded with suspicion. In October 2016, concerned parents in a small northern village padlocked the gates of

their local school and kept their children home to protest the integration of refugee children (Squires 2016). Since then, thousands of refugee and migrant children have begun attending Greek schools. With support from the European Commission and the International Organization for Migration, as of March 2017, at least 2,500 refugee and migrant children were being provided safe transportation to and from schools and equipped with school supplies (ECHO 2017).

As of 2012, tertiary educational attainment in Greece was at 27 percent of the total population. In 2013, women represented 48.8 percent of all students enrolled in higher education and 47.4 percent of those pursuing a doctorate. Greek women with a bachelor's degree or higher earned, on average, 40 percent more than women with only upper secondary education. Further, at the height of the economic crisis, women with higher educational attainment were more likely to be employed. The 2012 unemployment rate for women with tertiary degrees was 20 percent, versus 30 percent for those who had only finished secondary school (OECD 2017).

Health

For years, Greece was known as one of the healthiest countries in the world. The Mediterranean diet, which has been promoted in the United States and elsewhere since the 1970s for its health and weight management benefits, is based on traditional food patterns in Greece and southern Italy (Willett et al. 1995). Several studies have investigated the health habits of Greeks living on the island of Ikaria, where the average life span is 10 years longer than in the United States and the rest of Europe and a third of the population lives to be 90 or older (Anthony 2013).

Unfortunately, as in other highly developed countries, lifestyle and dietary habits have changed in many parts of Greece, particularly in urban areas, where the majority of the population now lives (CIA 2017). Greece's childhood obesity rates are among the highest in Europe, as the traditional Mediterranean diet has been replaced by Western dietary habits, especially among children and teens (WHO 2016). Health and risk behaviors have also impacted the adult population. Among EU countries, Greece has the highest rate of smoking and more than double the average rate of deaths caused by motor vehicle accidents (WHO 2016). In 2012, the life expectancy in Greece was 81 years; the average for women was higher, at 84 years, versus 78 years for men (WHO 2017).

Access to Health Care

The Greek National Health System (GNHS) has been subject to substantial cuts as a result of austerity measures imposed across Greece's public sector since the beginning of its debt crisis in 2009. Although these cuts prompted some needed reforms and gains in efficiency, the short-term impact has been a reduction in coverage and a deterioration of public health (WHO 2016; Simou and Koutsogeorgou 2014).

In 2008, Greece spent about 9.75 percent of its GDP on health care, on par with the average for eurozone countries. Between 2008 and 2014, average health spending in the euro area went up to 10.4 percent of GDP, while in Greece it declined to 8 percent (World Bank 2016). This reduction in spending reflects not only the efficiencies gained through necessary system reforms, but also the deep cuts to the GNHS workforce, including doctors, nurses, and other health care professionals. To meet fiscal austerity measures demanded by the Troika, Greek health services jobs were slashed by 10–40 percent, and workers' salaries and pensions were reduced by 40 percent (Simou and Koutsogeorgou 2014). The combination of staffing shortages and an increased need for services has reduced access to health care. Further complicating the issue, the economic crisis has been linked to a significant decline in self-rated health among Greeks, which may be a result of poor access to health care and worsening physical and mental health during the crisis (Simou and Koutsogeorgou 2014).

The European Migration Crisis of 2015 added further pressure to Greece's strained health care system. Hundreds of thousands of refugees and migrants arrived by boat, many rescued from the sea and suffering from hypothermia; many more were in need of psychological health services, having survived trauma and arduous journeys to escape war and violence. Under Greek law, asylum seekers are afforded free health services, and those with special needs, including children, pregnant women, the elderly, people with disabilities, victims of trafficking, and people arriving from conflict areas, are entitled to medical and psychological care equivalent to that available to Greek citizens (Library of Congress 2016). The public health system has collaborated with NGOs and international humanitarian aid groups in the attempt to provide services to migrants and refugees, but their efforts have frequently been overwhelmed by the demand and hampered by the EU-mandated austerity policies. In an ironic twist, despite the European Union's failure to deliver promised funds to

support the processing of asylum seekers, the European Commission has filed multiple infringement proceedings against Greece for failing to create and maintain a sufficient number of reception facilities for migrants (Library of Congress 2016).

Maternal Health

Declining fertility is an issue in many European countries, but in Greece, the birth rate fell dramatically—by nearly 15 percent—between 2008 and 2012, in part because of harsh austerity measures and high unemployment (Smith 2013). The overall fertility rate in Greece was 1.42 children per woman in 2016, among the lowest in Europe (CIA 2017). Unemployment for young people aged 15–24 reached as high as 60 percent in 2013, with even higher numbers for women, and many chose to postpone having children. Most workers who lost their jobs in the economic crisis also lost their health insurance. For uninsured pregnant women, there was a marked decline in access to prenatal exams and screenings, and between 2008 and 2011, the number of stillbirths rose 21.5 percent, from 3.31 to 4.01 deaths per 1,000 live births (Smith 2013). By 2016, the estimated rate of infant mortality had reached 4.6 per 1,000, and the maternal mortality rate was 3 deaths for every 100,000 live births (CIA 2017).

Employment

After Greece joined the European Union in 1981, the Hellenic Parliament enacted laws to promote gender equality in family, work, and education (Chionidou-Moskofoglou et al. 2008). More women began to participate in paid employment in the public and private sectors, there was a decrease in occupational gender segregation, and the pay gap between women and men narrowed (Maloutas 2003). The employment rate for Greek women, at 43.9 percent, is still well below the average for EU countries, and unemployment is a significant problem for both men and women in Greece. According to 2016 data, Greek women's share of paid non-agricultural employment was 46.2 percent, but the gross income per capita was only \$17,304 for women and \$32,683 for men (UNDP 2016).

Attitudes toward women's participation in paid labor liberalized substantially in the latter half of the twentieth century. Regarding matters of gender equality in Greece, women tend to be more socially progressive than men. In one study, Greek women were found to be more likely to approve of

women's employment in occupations traditionally dominated by men, and of men's employment in jobs typically performed by women (Marcos and Bahr 2001). Greek men maintain more rigid attitudes about gender roles, but collective transformations in Greek culture and society have led to improvements in the professional status of women, fostering success for many in the fields of business, media, government, and academia (Marcos and Bahr 2001).

Family Life

Traditional views about women's roles prevailed in Greece until the mid-1970s. Until then, patriarchal attitudes were enshrined in its laws. After signing CEDAW in 1982, the Greek Parliament unanimously approved a new family law in 1983. The former family law stipulated that "(a) the man is in charge of the family, (b) the wife should be responsible for the management of the marital household and the husband should be in charge of matrimonial responsibility, and (c) women should bear their husband's surname"; while under the new law, "(a) both spouses should make decisions about family matters, (b) there will be mutual responsibility in marriage and the family household, and (c) the woman may retain her own surname" (Marcos and Bahr 2001).

Although same-sex partnerships have been legally recognized in Greece since December 2015, marriage is still restricted to heterosexual couples. Among other EU countries, Greece has a higher-than-average annual rate of marriages, at 5 per 1,000 people in 2015. The average age at first marriage was 30.1 for women and 33.2 for men. The annual divorce rate in Greece is very low, at just 1.3 per 1,000 inhabitants in 2014, and the rate of births outside of marriage is by far the lowest in the EU (Eurostat 2017b).

As in other countries in Southern Europe, the family unit in Greece is an important social institution. When government systems of welfare are inadequate, strong family ties have traditionally provided a safety net. Since the onset of the economic crisis, many Greeks have struggled to sustain the burden of providing support and care for extended family members (Molokotos-Liederman 2015). With unemployment high among both men and women, patriarchal gender roles continue to place greater demands upon women to perform household tasks and provide caregiving to children, elders, and relatives who are out of work or disabled. The assumption that families, and particularly women, will fill the gap in state-sponsored social care allows the government to limit spending on public health and welfare (Molokotos-Liederman 2015).

Religion

Greece is an outwardly devout, religiously unified country: 98 percent of the population identifies as Greek Orthodox, 1.3 percent as Muslim, and .7 percent "other" (CIA, 2017). The Patriarch of the Eastern Orthodox Church, which split from Roman Catholicism during the Great Schism of 1054, resides in the former capital of the Byzantine Empire, Istanbul, a city that many Greeks still refer to as Constantinople. The clerical hierarchy is rigidly patriarchal. One of the holiest regions, the Mount Athos peninsula in the northeast of the country, is off limits to women, who are not permitted within 500 meters of its coastline. Other holy districts, like the monasteries of Meteora, include convents run by women.

The Greek Orthodox calendar is crowded with saints' days honoring both men and women. Icons, including ornate, silver-sheathed paintings of saints and the holy family, constitute an important focus of religious piety and are often kissed by the faithful as they enter a church. Pivotal celebrations like Orthodox Easter—the most important festival of the calendar—encourage the participation of the whole community. On the holiday of Good Friday, *epitaphios* processions wind their way through streets and cemeteries in ritual re-enactment of Christ's funeral; at midnight on Easter Sunday, a sacred flame from Jerusalem passes from the priest to the candles of parishioners, who emerge from their churches amidst a spectacle of fireworks.

While women have not made significant gains in access to positions of authority within the church hierarchy, many prominent Greek Orthodox theologians have recently concluded that no reasonable argument, beyond adherence to patriarchal tradition, exists to exclude women from ordination (Kalaitzidis 2014). Indeed, most scholars acknowledge that women in the early church occupied roles of greater authority than they have been afforded in recent times. Today, increasing numbers of Greek women are studying theology, becoming professors at Orthodox divinity schools, and working in educational and administrative lay positions within the church (Sotiriou 2010).

LGBTI Issues

The European Region of the International Lesbian, Gay, Bisexual, Trans, and Intersex Association (ILGA) publishes a yearly assessment of the status of LGBTI people in Europe. Greece ranked 15th among 49 European countries in ILGA-Europe's 2016 Rainbow Europe report, earning an overall score of 58 percent on ILGA's index of LGBTI

human rights (ILGA-Europe 2016). The index measures a country's achievements toward affirming and protecting the rights of LGBTI people in the areas of equality and nondiscrimination, recognition of family rights, policies against hate crimes and hate speech, legal recognition of gender and bodily integrity, freedom of assembly and expression, and asylum rights. While Greece has made measurable improvements in recent years toward equity and justice, more work lies ahead.

The term *lesbian*, despite its historic reference to the ancient Greek poet Sappho, who lived on the island of Lesbos and wrote about love between women, is considered an Anglo-American construct when used to describe same-sex desiring women. In 2008, three residents of Lesbos filed a lawsuit against the Lesbian and Gay Community of Greece (OLKE), demanding that the nonprofit gay rights group and others stop using the word *lesbian*. The plaintiffs, led by a right-wing magazine publisher, insisted that the term properly referred only to residents of the island and that it had been hijacked by the international gay community. They ultimately lost the battle to reclaim the word, and the island of Lesbos continues to draw lesbian tourists from around the world, particularly for the International Eressos Women's Festival held each year in September. Even so, many Greek women who engage in same-sex relationships are reluctant to identify themselves by commonly used Western terms, including *gay* and *lesbian* (Kantsa 2000; Kirtsoglou 2004). In Greece's patriarchal society, the normativity of heterosexuality is assumed, and high value is placed on marriage and motherhood. Thus, same-sex desire among women in Greece is often socially invisible (Kantsa 2000; Kirtsoglou 2004), and the subject has been "ignored and nonexistent from a legal point of view" (Maloutas 2003).

On the other hand, Greek transgender women have been harshly penalized for expressions of sexuality and gender identity perceived to violate patriarchal social norms. In 2012 and 2013, police in the cities of Athens and Thessaloniki were accused of systematically harassing transgender women, organizing sweeps and mass arrests on the pretext of verifying their identities and status as sex workers. On August 9, 2012, 25 trans women were detained by Athens police and forcibly tested for HIV (Greek Transgender Association 2013).

When the leftist Syriza party was elected to leadership in January 2015, their platform included support for the equality of lesbian, gay, bisexual, and transgender (LGBT) people, and they promised action on the issue of same-sex

partnerships. In December 2015, the Greek Parliament approved legislation that included the formal recognition of same-sex partnerships and the protection of transgender and intersex people from discrimination and hate crimes on the basis of sex characteristics or gender identity (ILGA-Europe 2016). Greece still does not provide civil marriage and adoption rights for same-sex couples, but the 2015 legislation offered hope to LGBT activists after several years of struggle. Prime Minister Alexis Tsipras apologized to the LGBT community for systemic violations of human rights and announced that the government would strive for justice in the future.

In a historic convergence of events, the island of Lesbos made international headlines again in 2015, as the Greek economic crisis and the European Migration Crisis peaked simultaneously. Of the more than 1 million refugees who made the perilous journey across the Aegean in 2015, some 60 percent landed on Lesbos, jeopardizing the island's vital tourist industry (Cheslow and Estrin 2016). Lesbians, tourists, and aid workers alike joined together in a humanitarian effort to rescue and support the hundreds of thousands fleeing war and seeking a better life in Europe. The residents of Lesbos—including fishermen who tirelessly patrolled the water and pulled hundreds of people out of the sea, and grandmothers who provided clothing, food, and comfort to exhausted and frightened children and their families—were nominated for the 2016 Nobel Peace Prize (Amin 2016).

H

Hungary

Overview of Country

Hungary is a landlocked Central European country in the Carpathian Basin. Bordered by Austria to the west, Slovakia to the north, Ukraine to the northeast, Romania to the east, and Serbia, Croatia, and Slovenia to the south, it is relatively small at 35,000 square miles (93,030 sq. km). Its population according to the 2011 census was 9,937,628. Hungary is divided by two main rivers, the Danube and the Tisza, and the geography is diverse: mountainous in the northeast, rolling hills in the northern parts, and fertile agricultural lands in the central and south regions. Lake Balaton and Lake Hévíz, both in western Hungary, are the largest lake and largest thermal lake in Central Europe.

Hungary ranked 43rd out of 188 countries in the UN Development Programme's (UNDP) Human Development Index (HDI) with a Gender Inequality Index (GII) score of 0.252 in 2016. Gender equality in Hungary appears high, but according to some important measures, such as women's representation in politics, it is one of the lowest in Europe. There are few women in government: they occupied 10 percent of the seats in Parliament and represented 12 percent of municipal councilors and 7 percent of the diplomatic corps in 2016. Despite the general global trend of decreasing gender inequality, the corresponding Hungarian data appears to have increased based on at least

some of the international measures, such as the World Economic Forum's (WEF) Global Gender Gap Index (GGI) in which Hungary slipped from 55th position in 2006 to 101st in 2016. According to the Gender Equality Index of the European Union's European Institute for Gender Equality (EIGE), in which 100 qualifies as perfect equality and the average among member states is 54, Hungary's score was 41.6; the highest ranking was Sweden's 74.2, and the lowest was measured in Romania with 33.7 in 2016.

The current Hungarian borders were established by the Trianon Peace Treaty of 1920. Hungary's turbulent history continues to affect its sense of self, its approach to gender roles, and its relationships with neighboring countries as well as alliances with international institutions and recognition of such norms as democracy and human rights.

Controlled by the Soviet Union since 1948, Hungary experienced revolution in 1956 in reaction to the totalitarian communist regime, but more years of repression followed. Hungary became the "most cheerful barrack" of the Soviet bloc in the 1960s, and economic reforms paved the way for small business entrepreneurs. Women benefited less than men from these economic opportunities, as few of them established such firms, and female-owned enterprises accounted for only one-third of all companies by the 1990s.

Hungary is moderately ethnically diverse. The population is approximately 90 percent ethnic Hungarians, but estimates place the Roma (Gypsy) population at 3–12

percent and the German, Slovak, and Romanian populations at about 1 percent each. In the 2011 census, nearly 15 percent of respondents did not specify an ethnic origin, which may reflect negative attitudes toward the Roma, Jewish, and immigrant populations. The same census counted 11,000 Jewish residents, but sociological estimates put the country's Jewish population at approximately 120,000.

Hungary is home to many religions. Christianity was introduced with the founding of the state in 1000 CE, and the Reformation brought Protestantism. Roman Catholics (38%) and Protestants (14%) constitute 52 percent of believers, and most of the Orthodox Christians (about 2%) live near the eastern and southern borders of the country. Jews arrived in the early medieval period, and people of the Islamic faith have lived in Hungary since the 150-year Ottoman occupation (1526–1686). Various small religious sects persisted despite the oppression during many periods of occupation. Before World War II, about 825,000 Hungarians were Jewish; approximately 565,000 of them were killed during the Nazi era. Those who returned from concentration camps and slave labor to live in communist Hungary continued to face persecution, as did other faith communities if they openly practiced their religion.

Travel and trade opened up again after the collapse of communism in 1989, and Hungarian society became more receptive to Western influences. Hungary joined the European Union (EU) in 2004 and the North Atlantic Treaty Organization (NATO) in 1999. Hungary has achieved 20 percent female participation in the armed forces—double NATO's rate—since its military opened to women in 1997.

With freedom of movement and education and employment opportunities open in the European Union since the late 1990s, many of the young and educated have left Hungary. Observers compared this unexpected mass exodus to two similar migrations in Hungarian history: one in the very beginning of the 20th century, with many poor landless peasants and workers looking for jobs and a better life, and the other after the Soviet Union crushed the 1956 revolution. However, in contrast to the earlier two waves, the current emigrants tend to be more gender-balanced and at least have the possibility of returning, unlike earlier times when mostly young men had to leave their families behind and the borders closed behind them. Young women today are more inclined to seek a better future abroad because Hungarian women's education is generally higher than men's, although women tend to study the humanities, law, and medical fields, while men choose engineering and information technology. However, many young and

less-educated Hungarian women are lured by the promise of fast money and work as prostitutes in Western Europe.

In response to the substantial political, social, and economic changes following the peaceful and negotiated end of communism in 1989, traditional norms, including more conservative attitudes to women, have reemerged. Attitudes toward ethnic, religious, and sexual minorities, such as the Roma, Jews, LGBT, and immigrants, became less welcoming under the guise of nationalism.

In the past five years, Hungary's turn away from the norms of democracy came as a surprise because this country was a stalwart of democratization in the 1990s. The emergence of public and officially condoned expressions of nationalism-based exclusion are in stark contrast to the minutely censored public discourse during the communist era, when economic class formed the official mode of discrimination and the one-party system eliminated freedoms of assembly, speech, and religion.

With the communist system progressively declaring men and women equal but oppressing them politically, the sexes joined in solidarity in the private sphere against the common public enemy, the ever-intruding state. The 40 years of Soviet influence left a mixed legacy regarding women's employment; educational, social, and political achievements; rights; desires; diversity; and ability to organize in pursuit of their and others' interests.

Health

The Hungarian population has been declining due to low birth rates and a recent immigration wave to the West that is especially prevalent among the young. Additionally, the number of elderly has become a female problem in Hungary: 80 percent of those over 80 years old are women, and every eighth woman is a widow over 60 years old. Consequently, women are more likely than men to live alone. These trends most likely will further intensify with the increased out-migration of the younger generation to study, work, and settle abroad.

Access to Health Care

The Hungarian state spent 5.2 percent of the gross domestic product (GDP) on health care in 2005, 4.5 percent in 2010, and 5.3 percent in 2015. While access to health care is officially free and universal, patients are expected to pay significant sums “under the table” to doctors, nurses, and (in hospitals) even cleaning staff. Both this unofficial but

deeply entrenched payment scheme and the ethnic discrimination against Roma challenge the implementation of universal health care access. The price of medications has been steadily increasing, reaching 5 percent of household expenses in 2012. The number of those who could not pay for their medications varied considerably (reaching over 10% among those aged 55–64), but in every age strata, women are the majority (Kovács 2014, 249–50).

According to the 2011 census, every fifth woman considers herself struggling with a prolonged disease, and one-third of women over 60 are chronically ill. Women's life expectancy in Hungary is 78 years, which is among the lowest in the European continent. Hungarian women are 70 percent more likely to die from cervical cancer and 10 percent more likely to die from breast cancer than their EU counterparts. Since 1997, mammography has been freely available every two years for women aged 45–65, and with a health care network that calls women to come for the screening, participation increased from 8 percent to 35 percent by 2003 (Kovács 2014, 234). Although a similar system is in place for cervical cancer screening, the highest participation rate was 56 percent in 2009, which is 10–20 percent below what is considered a high level of prevention.

The reasons for low participation are financial and informational: it is often difficult and expensive to travel to the centrally located health care facilities, and women may not have the education to understand why they should subject themselves to these often uncomfortable exams that are performed without regard for privacy. While both maternal and newborn mortality are low, the former is 100 percent higher and the latter is 30 percent higher than the average of the other EU member Central European countries (Kovács 2014, 217).

In Europe, only Romania has a higher rate of abortions than Hungary, with women younger than 20 requesting every second pregnancy terminated (Kovács 2014, 219–220). After a period of total prohibition of abortion in the early 1950s, abortion became legally available until the 12th week of pregnancy if a woman stated that she was experiencing a crisis situation. In 1992, the conditions were tightened by requiring two rounds of counseling and at least three days' waiting in between. Hospitals charge a sliding fee for the procedure. Women's reproductive rights have been increasingly challenged recently. First, the new constitution in 2012 declared that life begins at conception. Second, in 2013, a new law on child protection redefined a pregnant woman's crisis situation. Now a woman

concealing her pregnancy can be interpreted as threatening the fetus's life.

One of the first claims against the Hungarian state submitted to the UN Committee on the Elimination of Discrimination against Women (CEDAW) concerned the forcible sterilization of Roma women (*A.S. v. Hungary* 2004). Despite a favorable decision in the claimant's favor, the Hungarian state compensated her only after considerable foot-dragging in 2009.

Childbirth and Maternal Health

By closing local birth centers and eliminating independent midwifery, the process of centralizing maternal health care dramatically speeded up after World War II in Hungary. Within a generation, hospitals emerged as the exclusive setting where women gave birth. Birth became increasingly medicalized and began including invasive and often unnecessary interventions that eliminate the possibility of natural birth. For example, 33 percent of births are cesareans in Hungary, while the WHO recommends this procedure be used only in the most urgent 5–10 percent of cases.

Maternal health care in Hungary and women's choice of the mode of birth made international headlines in October 2010 because of a dramatic clash between the proponents of the Hungarian home-birth movement and state authorities that saw Dr. Ágnes Geréb, a highly respected obstetrician-midwife, shackled in public and sentenced to prison for allegedly causing the deaths of two newborns and injuring others. After more than two decades of intermittent negotiations with various Hungarian governments, the difference in values between a loose coalition of activists in support of Dr. Geréb; her group of independent midwives, doulas, and birth advocates; and the Hungarian legal and medical establishments escalated to the level of open confrontation and acute crisis (Fábián 2014a).

The case of home birth and midwifery in Hungary eventually landed in front of the Strasburg-based Court of Human Rights of the Council of Europe, which ruled that women in Hungary have the right to choose the place and mode of giving birth (Hayes-Klein 2012). The pressure from domestic constituents and international experts and organizations eventually shamed the government into legalizing home birth and independent midwifery in March 2011. The prosecution of Dr. Geréb and the emerging home-birth (midwifery) movement have highlighted, broadened, and problematized the previously taboo topic

of women's treatment during pregnancy and birthing. By choosing to give birth at home, offering alternative birth trainings, and providing entirely new frameworks of medical information through various media, as well as organizing protest rallies during times of crisis, these mothers-turned-activists framed birth in an entirely new way that is free, or at least freer, from state intervention and the power of medical establishment over women's bodies and decisions. The Hungarian home-birth movement's dramatic juxtaposition of women's dehumanization during the birthing experience in hospitals with the culturally elevated and rhetorically glorified act of giving birth has challenged many existing social and political hegemonies, such as the state and the (nearly exclusively male) gynecologists assuming to know what is best for women.

Girls and Teens

The teaching and imposing of gender stereotypes starts at birth, and is reinforced by parents, the family's broader network, and education. Gender markers include the selection of the baby's name as well as the clothes and colors the child would be surrounded by and wear. The prevailing gender stereotypes strongly encourage Hungarian women and girls to pursue the traditional rewards offered by beauty, obedience, housekeeping skills, and excelling in education. Women tend to earn better grades and are more likely than men to finish formal education.

Education Opportunities

Hungary spends approximately 5.2 percent of its GDP on education in 2015, which is below the EU average. In the 1990s, educational expenses dramatically increased, although they eventually dropped in 2009–2011.

In part due to gender stereotypes that encourage women to be diligent, obedient, and good students, women have greater educational achievement than men. Slightly more than 50 percent of women have finished at least high school compared to 42 percent of men.

Crèches for children under age 3 were provided by state-owned enterprises at a very affordable price during the communist era, but with the advent of mass privatization in the 1990s, such services nearly entirely disappeared, resulting in overcrowded facilities. Despite considerable demand for child care and with slightly increased investment to refurbish crèches, the state's message has been that mothers should stay at home with young children, thereby

removing many women from the official unemployment rolls.

Day care centers for children aged 3–6 have become unexpected battlegrounds for gender equality. In 1996, the official guidelines for the educational aspect of these institutions included a sentence that followed the principles of EU gender equality and asked such institutions to avoid strengthening gender stereotypes and to help eliminate prejudices concerning gender inequality. By 2012, increasingly conservative views and more openly expressed antigay sentiments led to all references to gender being eliminated, and the guidelines asked that employees avoid all kinds of prejudices.

Nearly all workers in crèches and day care are women, and 83 percent of teachers are women, although they tend to teach younger grades. Most university professors in the fields of education, social welfare, and health care are women. Whereas 54 percent of university students are female, only 19 percent of university professors were women in 2006 (Kereszty 2014, 290). In 2011, only 6 percent of members of the Hungarian Academy of Science were female.

While the number of children has been declining in Hungary, the total number of minors (younger than 18 years of age) registered under specific state protection (but not necessarily in an orphanage or in foster care) has been rapidly increasing. The number grew by 63 percent between 2000 and 2006 and further swelled by 50 percent between 2007 and 2011 (Farkas et al. 2014, 172). Foster parents have accommodated 60 percent of girls, leaving the others in state-run institutions. As with other politically sensitive important welfare considerations, the recording of ethnicity could be considered discriminatory, and statistics of welfare agencies do not note whether the children they encounter are Roma. According to anecdotal evidence, a considerable proportion of the children in orphanages are of Roma ethnicity, taken into state guardianship often due to their birth family's low standard of living.

Sex Education

After a 1973 (communist-era) government decision on population and demography, sex education was introduced in the second year of high school with the hope of enhancing family planning. Another high school program focusing on "family life" emerged in 1996. By 2002, the state had abandoned even the appearance of supporting sex

education and teaching about contraception, including the birth control pill. Certain groups have sporadically stepped in to fill in this void: the nongovernmental organization (NGO) Sex Education, for example, produced handouts and modules to be used as teaching aids in high schools. When LGBTQ groups attempted to offer similar courses in a few high schools in Budapest, some parents protested loudly enough that most principals stopped these projects. Sexual orientation, gender identity, and, since 2012, gender equality are missing from the National Educational Plan (*Nemzeti Alaptanterv*), which is the basic guide for the aims and development priorities of public education (Kereszty 2014, 280–285). It places heavy emphasis on love, marriage, family, and establishing a home.

An analysis of textbooks showed that few of Hungary's notable female writers and artists are represented on their pages. Hardly any LGBTQ and Roma made an appearance in the textbooks at all. The two sexes appeared as complementary and essentially different—similar to a yin-and-yang illustration.

Educational Opportunities for Roma Girls

Instead of recognizing intersectional discrimination—the combined effect of ethnic and gender discrimination as well as disadvantaged social and economic status, migration, and often living in a rural environment, where accessing public services is difficult—the Hungarian government and society have largely abandoned the problem of the Roma. Consequently, the segregation of the Roma population has continued and even worsened, in large part because of their substandard access to education. The Roma have lower literacy rates: 80 percent of Roma reported that they can read and write compared to 99 percent of non-Roma, with Romani women having 20–30 percent lower literacy rates than Romani men. The education gap stems from and strengthens ethnic and gender discrimination, leading to further social and economic exclusion and deeply entrenched traditional gender roles (EERC 2014).

Due in part to forced and child marriages, as well as being recruited into prostitution, Romani girls often drop out before finishing compulsory education at age 16. Only 5.8 percent of Hungarian Romani women have vocational qualifications, in contrast to 17.5 percent of Romani men (FRA 2013). The physical segregation of Romani children into Roma-only classes and schools for the disabled is common practice, which violates European Union, Council of Europe, and international law standards.

Young Women's Extracurricular Achievements

In sports, quite a few young female Hungarians have archived major success, breaking gender barriers and prohibitive stereotypes: Krisztina Egerszegi won her first of five Olympic gold medals in swimming at age 14, with Katinka Hosszú, the “Iron Lady” of swimming following these footsteps with three Olympic golds and six long-course world championships. The Polgár sisters have established themselves as chess champions, with one of them, Judit, being the number one rated woman in the world since 1989 and a grandmaster since age 15.

Employment

Hungarian women's opportunities in employment dramatically differ from men's. As in other parts of the world, women in Hungary work more and earn less than men, there are fewer of them in leadership positions, and they are more likely to juggle family and work obligations than their male counterparts. Significant inequality exists between men and women in Hungary: women account for 65 percent of the time spent on household chores and 70 percent of the time spent on child care.

In contrast to other European countries, Hungarian women's labor participation has dramatically declined in the past 25 years. During the first 6 years of the transition from communism to capitalism, women's labor participation dropped from 67.3 percent to 45.5 percent, and men's dropped from 82.9 percent to 60.1 percent. In 2013, women constituted 42 percent of the active labor force. With women staying at home to care for others, or taking up part-time and semi-legal or illegal jobs when they could not find full-time employment, their unemployment rate remained lower than men's. A more traditional interpretation of women's roles meant their declining labor force participation and long-term unemployment raised no alarm.

The Hungarian state has routinely subsumed women's employment policy under the seemingly more important considerations for demography. The proportion of GDP spent on child and family support shrunk from over 4 percent in the mid-1980s to 1.7 percent in 1997; it increased to 2.1 percent in 2010 and 3 percent in 2013 (Aczél and Gyarmati 2014, 175). Although Hungary pays a relatively high (7% of the average wage) universal basic allowance for children under age seven, it has proven inadequate for large families, which are disproportionately more likely among the Roma.

Two groups in particular have a very difficult situation in the labor market: mothers with small children and women over 50. Although women everywhere experienced a reduction in employment opportunities during the recent economic crisis, Hungarian women were the most likely in the European Union (67% compared to the European Union's 47% average) to be asked whether they had children during a job interview before being asked about their skills and experience. Becoming a parent reduces women's chances of employment by 37 percent and increases men's chances by 8 percent. In contrast to 5 percent of men perceiving prejudice against them in hiring and employment, one-third of Hungarian women feel discriminated against due to their gender and family status. Roma women and women with no vocational training often face insurmountable difficulties in finding and keeping jobs. Fear of retaliation and very low levels of trust are why four out of five people believe it is not worth reporting discrimination (Vajda 2014, 128).

Despite a notable advantage in formal education, females tend to advance only to midlevel leadership. The wage gap between the sexes has been 13.5 percent in 2015 and it would likely be much higher if the significant gray (semi-legal) economy were included. Vertical segregation (i.e., the disproportionate gender ratio of individuals in leadership positions) links with horizontal segregation, namely, that women tend to be more concentrated in low-paying and less respected jobs. The private sector continued to be dominated by men (61.7% in 2009) and the public sector by women (66.3%) (Szikra 2013, 4).

The wage gap in Hungary has actually shrunk (it was 35% in the early 1990s), probably due to the relative increase of value attributed to the service industry, such as health care, banking, and tourism, where many women are traditionally employed. Ironically, this contemporary advantage most likely emerged because of communist-era educational and employment incentives that led more women to low-paying jobs that required learning languages along with acquiring skills in finances, law, and medicine—all of which became much sought-after skills with the emergence of competitive service industries.

Women are in a disadvantaged position in the job market, but poverty affects 33 percent of people of both genders. With women seven times more likely than men to be single parents, and earning lower pensions and unemployment benefits, their ratio among the poor increases, but they are less publicly visible than the most frequently encountered poor people in urban settings: the mostly male homeless.

With the 1998 austerity measures, women's retirement age increased by 10 years, to 65, in a course of a decade. The creative and vocal protests of women's groups, especially trade unions, against the unexpected raise in retirement managed to slow down the implementation of this policy, which hit women who entered the labor force during the most trying years of postwar reconstruction and communist-era industrialization. Often well before retirement, older women became essential caregivers to the broader family, especially to the grandchildren, before then needing attention themselves.

Family Life

Declining birth rates and a growing elderly population tend to characterize late industrial societies where women postpone or opt out of childbearing in favor of education and rewarding careers. Few women plan more than two children, and the average maternal age moved from the early twenties in the middle of the previous century to 28.3 years in 2011 (Kovács 2014, 228). Hungarians, like many other relatively small ethnic groups, perceive the decline of the population as a forewarning of national extinction. Hungary used to have one of the highest rates of employment among women, but this proportion changed very fast in the 1990s to become one of the lowest in Europe. The long-standing and extensive social policies that encourage women to give birth and stay at home to raise children have had only short-term effects on increasing the birth rate. While the three-year-long paid maternity leave for each child appears to support women balancing family and work responsibilities, the extended departure from the workplace also creates a trap that is especially hard to escape from when a woman stays at home with two or more children for six years or longer.

With the shortage of early child care facilities, strong social incentives, and the three-year-long paid maternity leave in effect since 1967, traditional gender roles survived during communism and became further revived since the change of the political system. The now nearly 50-year-long continuity of maternity benefits brought much relief to many women, but they also reduced the likelihood of their return to the paid labor force. The assumption that women's paid labor participation negatively affects childbearing and child-rearing holds steady in Hungary. Although men in Hungary are entitled to take paternity leave, only 5 percent of fathers have used this opportunity since it became available in 2010 (Aczél and Gyarmati 2014, 176).

The Roma face particular problems concerning family size. The Roma migrated from Northern India to Europe more than 500 years ago, but they are still considered undesirable outsiders. With Roma girls marrying young, they have very little formal education and face intense discrimination in the labor market, leaving few options to gain their traditional communities' respect beyond having children. While children are highly valued in Roma families, a large family makes poverty more likely, and poverty would further challenge good educational and employment opportunities for both parents and children. When a Roma family and its kin are poor, the women may be forced to beg, often with their children, or work as prostitutes. The spiral of poverty, discrimination, and lack of education and employment opportunities further enforce the negative stereotypes against them.

Politics

With the appearance of the first written testimony of Hungarian women's organizing in 1790, women's voices began to emerge as one of many that called for modernization, education, and national independence. The first registered women's group was a charity association in 1817, leading the way toward fighting for women's education in the mid-1800s and their professional associations by the end of the 19th century. The close cooperation with international counterparts of the Hungarian female professional associations and suffragists was dramatically broken by World War I and the crisis-ridden interwar years. World War II maintained the distance of Hungarian women's groups from democratizing movements.

Women's suffrage arrived in 1945—to be curtailed by the communist takeover in 1948, when freedom of association, assembly, and speech were extremely limited. The communist system promoted women to serve its ideological, economic, and political aims. Women's quotas in the Communist Party-controlled legislature were much derided, which may explain why there are still so few supporters of the two parliamentary bills and one public referendum to reintroduce the quotas to address the low proportion of women's representation in formal politics. Despite the European Union's 1997 Amsterdam Treaty requirements and two recent (2007 and 2012) CEDAW country reports asking that Hungarian women be better represented in politics, gender equality is generally not considered in governmental decision making, and sexism

(often in the form of derogatory statements) became a mainstay in parliamentary debates and the media.

Participation in Government

There have always been many fewer women than men in Hungarian governments. No woman has been elected as head of state or prime minister as of 2015. In the 25 years since the collapse of communism, women have occupied 8 percent of positions in Hungarian governments, usually taking less prominent positions, such as family and social welfare or health and sports. In the 1990–1993 Antall administration, there was only one female minister; there were two in the Horn government and one in the first Orbán government. Between 2006 and 2009, the left-wing administrations offered government positions to more women: there were five female ministers in Péter Medgyessy's government (accounting for 20%), two in Ferenc Gyurcsány's first government (10%), and three in his second government (15%). In the Bajnai administration, there were no female ministers. The second Orbán government (2010–2014) had only one female minister, and there are no women in the third and current Orbán government.

In 1995, the Hungarian government established a secretariat to represent women's interests and created a coordination committee that included ministry officials and various nongovernmental women's associations. For the past 20 years, this government office has struggled to maintain its staff and relevance and it eventually entirely disappeared.

In local government, the proportion of women mayors had nearly doubled since 1990, reaching 19 percent in 2010, but it dropped to 12 percent in 2014. Only five women were elected to run cities over 20,000 inhabitants.

Female Parliamentarians

Women increasingly participate in the electoral process in Hungary: their proportion among the candidates for legislative seats has doubled since 1990, the date of the first free elections after communism. However, most political parties list women candidates in the lower ranks on their electoral list; only once has women's representation been higher than 10 percent in the national legislature (1994–1998, with 12.2%).

Women's Associations

Since 1989, as the near monopoly on political power held by the Communist Party has shifted toward a more democratic

political environment, so too have gender roles in the post-communist region been dramatically transformed, thoroughly affecting the ways women organize. The resultant emergence of a variety of new women's groups in Hungary has mostly been attributed to the newly achieved right of association and increased freedom. These women's groups have also contributed to a greater diversity of gender roles.

By establishing and strengthening a network of domestic groups and connecting to international NGOs, Hungarian women's groups and their activities have begun to slowly chip away at the exclusive state-centered focus of politics. The changes since communism in women's political status are most evident in their enhanced political representation that includes NGOs and unregistered associations that assist women and their allies in finding each other, forming groups, and publicly expressing their views and interests (Fábián 2009).

Only a minority of Hungarian women's groups identify with feminist consciousness. From the small number of feminist adherents, seven groups in particular stand out because of their persistence and prominence: the *Feministák Egyesülete* (Feminist Alliance), active 1904–1942; the *Feminista Hálózat* (Feminist Network), formed in 1990 and ceased operation around 2002; *Nők a Nőkért az Erőszak Ellen* (NANE, Women against Domestic Violence), a domestic violence hotline established by Feminist Network members in 1994; *Labrisz*, a lesbian association officially established in 1999 after many years of informal existence; *Nők lázadása* (Women's Riot), which was most active in promoting the criminalization of domestic violence that the Hungarian Parliament enacted in 2013; and *Magyar Női Érdekérvényesítő Szövetség* (Hungarian Women's Lobby), the Hungarian member of the European Women's Lobby (EWL) (Fábián 2014b).

Antifeminism and hybrid feminisms emerge as distinctive elements in Hungarian women's organizing. Hybrid feminism tends to focus on issues raised by foreign women's advocates, but it adjusts these topics according to the local culture and politics. In addressing local audiences, it often reframes Western feminist issues around defending or reviving, but not directly challenging or stamping out, traditions that view children's welfare as women's main public concern. Hybrid feminists situationally embrace or reject local understandings of motherhood, marriage, religious devotion, and domesticity or gender-specific discriminatory practices. Such hybridization has taken place

regarding many issues, but most notably the foremost agenda item of contemporary international human rights treaties has been domestic violence (Fábián 2014c).

Many women's groups remain informal, and those who formalize and establish an NGO struggle with collecting and maintaining funds for their operation and activities. In 2013, of 2,831 winning applications, the state funded 24 NGOs that had “women” in their names, but these did not include any feminist groups or groups that work to support feminist causes, such as domestic violence (Ilonszki 2014, 41).

LGBTQ Issues

LGBTQ issues are highly contentious in Hungary: sexual orientation and sexual identity appeared in the vocabulary relatively recently, and they are quite controversial in the public eye and for the legislative agendas. The first Budapest Gay Dignity Procession (later called Budapest Pride) took place in 1997 and grew into a weeklong series of activities: a film festival, public discussions, art exhibitions, theater productions, author readings, picnics, speeches, religious events, concerts, and parties. All these events culminate in the now annual parade across Budapest's best-known thoroughfare, from the Andrassy Boulevard to the Parliament. Due to sporadic counterprotests, the parade applied for and gained police protection as of 2007; for three consecutive years, many of the marchers were heckled and some even physically assaulted.

As in many other parts of the world, two women can publicly hold hands and kiss (on the cheeks) without repercussions: they would be seen as family members or friends. However, if these two women appear as lesbians and clearly express their affection for one another, they would most likely attract many negative comments or worse. Being openly gay is a personally and professionally dangerous choice that can leave one open to verbal and possibly physical attacks.

Although the EU-mandated Hungarian antidiscrimination laws protect sexual minorities against hate speech and mete out additional punishments for hate crimes, LGBTQ rights sharply split the Hungarian population into two groups. One group sees LGBTQ rights as features of a democratic society, and the other considers them an unacceptable outcome of what they call “gender ideology.”

While registered partnerships of same-sex couples were recognized and placed on equal footing with those of

heterosexual couples in 1996, the 2011 Family Protection Act weakened the legal status of same-sex couples, and the 2012 constitution defined marriage exclusively as a union between man and a woman. Given that only married couples can adopt, same-sex partners are excluded from adopting.

Religious and Cultural Roles

Women tend to be responsible for the ethnic and religious education of children. Both tasks are largely entrusted to women—as mothers, grandmothers, aunts, teachers, social workers, and so on—as they rear the younger generation. Religious life was revived with the reintroduction of freedom of worship and assembly in the late 1980s. The gender division in both new religious groups (such as Jehovah's Witnesses and Hare Krishna) and traditional ones is similar: the leaders are nearly all men, and the congregation tends to be (older) women. Age also influences the practice of religion. During the 40 years of communism, religious education and religious practices were initially banned and later strongly discouraged. These conditions have produced a middle-aged population that is either not religious (18% of the population) or has no religious affiliation (21%) according to 2016 surveys.

Issues

Domestic violence, trafficking, and prostitution remain invisible to the public and the political leadership of Hungary. The characterization of these problems as structurally gendered continues to be rejected, with violations of women's human rights attracting attention only because of international pressures and expectations. There is very little research and even less empirical data on each of these important problems because the various governments do not recognize the importance of gathering such evidence.

Domestic Violence

Hungary does not publish a report on domestic violence or provide sex, age, and relationship-segregated domestic violence statistics. It also does not collect national representative data in this area. The only large-scale survey on how many women are affected by domestic violence was conducted in 1998, when relatively few women were aware of the meaning of this term, despite being familiar with its occurrence. This lack of information seems to have continued, according

to the 2012 EU-wide comparative survey on the incidence of violence against women, because in every instance, except psychological violence by a partner, the Hungarian survey results are significantly below the EU average (FRA 2014).

It took over 20 years of pressure from local NGOs and individuals before domestic violence was officially recognized as a crime in 2013. Emergency restraining (protection) orders have been on the books since 2006, but they are rarely applied. Of the 16 family centers where women with underage children can find temporary shelter, not one is serving women victimized by domestic violence and only one rarely used shelter serves victims of trafficking (Hagemann-White 2014). With no conduct guidelines or self-regulatory standards for media professionals, news reports sensationalize cases of violence against women and describe killings of intimate partners as euphemistic *szerелеmfeltés* (love concerns). Hungary signed the Council of Europe's Istanbul Convention on preventing and combating violence against women and domestic violence in March 2014, but it has not yet ratified it. Prosecutors can only initiate criminal proceedings in the most severe cases of violence in the family and for sexual violence. Sexual harassment at work or in any other environment is not a specific criminal offense.

Prostitution and Trafficking

Since 1955, Hungary has been a signatory of the New York Convention that prohibits prostitution and the operation of brothels. However, prostitution did not cease to exist during communism; it was merely restricted to hotels for the privileged few and to specific areas of roads and inner cities, which everyone knew about but no one openly talked about. Since 1993, prostitution has been decriminalized, while pimping and running brothels remained criminal activities. The supposedly temporary measure in 1999 between legalizing prostitution (as the Netherlands, Switzerland, and Germany chose) and punishing the client (which Sweden established) was that Hungarian local governments established zones where prostitutes could offer their services, but not in the immediate vicinity of schools. The official attitude, even in 2010, was that child prostitutes chose this profession voluntarily in search of a better income. Only 1,155 people signed the petition of Hungarian human rights NGOs that demanded attention and services dedicated to resolving the plight of underage prostitutes in Hungary (Tóth 2014, 314). While human trafficking strongly correlates with sexual abuse and

prostitution, Hungarian research and data are scant on each of these issues and the relationships between them.

Iceland

Overview of Country

Iceland is a Scandinavian island country located in the North Atlantic and surrounded in part by the Greenland Sea. Iceland was ruled by a home government from 1904 to 1918, was under the Danish crown from 1918–1944, and finally won independence and full sovereignty in 1944. Iceland is almost 40,000 square miles (103,000 sq. km)—roughly the size of the state of Kentucky—and consists of 3 percent lakes, 11 percent ice caps and glaciers, 23 percent vegetation, and 63 percent wasteland. As of 2015, the total population of Iceland was 330,141, with the male population at 50.4 percent (166,307) and the female population at 49.6 percent (163,833). The ethnicity of Iceland is 94 percent a homogenous mixture of Norse and Celtic origin and 6 percent of foreign origin. The life expectancy of the population is roughly 82 years. Iceland ranks 223rd of 224 countries with an infant mortality rate of 2.06 percent, the second lowest in the world (CIA 2016). As of 2010, the maternal mortality rate was 5 in every 100,000 live births. Iceland's gross domestic product (GDP) was \$17.04 billion as of 2014, and it had an unemployment rate of 3 percent (World Bank 2016; Focus Economics 2016).

Iceland is a representative democracy and a parliamentary republic. The president is elected by popular vote for a four-year term; Iceland's first female president was elected

in 1980. Vigdís Finnbogadóttir held office from 1980 to 1996 and was the first female president in the world. Parliamentary elections are held at intervals of four years or less. Althingi, the Icelandic Parliament, is composed of 63 members elected for a period of four years and representing six constituencies. In the general elections in April 2013, 25 women and 38 men were elected to the Parliament (Icelandic Parliament 2016). In 2009, the first openly lesbian prime minister was elected as head of state. Jóhanna Sigurðardóttir served four years as prime minister.

The UN Development Programme (UNDP) ranks Iceland 13th out of 187 countries on the Gender Inequality Index (GII) with a ranking of 0.088 (UNDP 2013). Many sources list Iceland as the most feminist-friendly country in the world, while others note the country still has a long way to go, especially in terms of education, economics, and equal pay. Iceland ratified the Convention on the Elimination of All forms of Discrimination against Women (CEDAW) in 1985 and was formally reviewed by the United Nations on its implementation of CEDAW on February 17, 2016. The Icelandic Human Rights Center and the Icelandic Women's Rights Association released a shadow report for the implementation of CEDAW at the beginning of 2016, which will be referred to throughout this article (Icelandic Human Rights Center 2016).

On October 24, 1975, more than 25,000 Icelandic women walked off the job in Iceland to demand equal pay and benefits in what is now known as the Women's Day

Off, and since 2005, on the 30th anniversary of the walk-out, this has been celebrated annually.

Iceland has strong women's rights and feminist movements dating all the way back to 1907, when the Icelandic Women's Rights Organization was founded. In the 1970s, the Redstockings started a radical feminist movement. In the 1980s, the Women's Party replaced the Redstockings. In 1982, the Women's Alliance ran for local office in local elections, and the next year, they ran for parliamentary office in parliamentary elections. Finally, in March 2003, the Feminist Association of Iceland was founded. In 2011, Janet Elise Johnson of *The Nation* called Iceland "the most feminist place in the world" (Johnson 2011).

Nevertheless, Icelandic women still face many major issues inhibiting gender equality, including equal pay, trafficking of women and young girls, violence against women, abortion, and education. In a statement to the UN Global Leaders' Meeting on September 27, 2015, the prime minister of Iceland said, "Iceland is committed to closing the gender pay gap by 2022 . . . it may be as much as an 8% pay gap between men and women," which is relatively low compared to other countries but is still "unacceptable" (UN Women 2015). Prostitution has only recently been criminalized in Iceland (2009), with sex workers being treated as victims of sex crimes by those willing to purchase sex. Sex shops are still prevalent in the larger cities, although new laws banning strip clubs (2010) are being enforced with increasing regularity. In 2008, a survey of 3,000 women aged 18–80 years showed that 42 percent had experienced violence by men, 30 percent had experienced physical violence by men, and 24 percent had experienced sexual violence by men (Icelandic Women's Rights Association 2016). While abortion is legal, it is not available on demand or at the request of the woman; the law limits choice.

Girls and Teens

As of 2012, 90 percent of Icelandic children ages 1–5 are in some form of day care. Most municipalities of Iceland pay 85 percent of the operations cost of kindergartens (Center for Gender Equality in Iceland 2012). According to UNICEF, only 4 percent of infants in Iceland have a low birth weight. The under-5 mortality rate for children is 3 for every 1,000 live births. Malnutrition in children is not a concern for Iceland (UNICEF 2016). UNICEF also published information on immunizations in children, including for DPT 1, DPT 3, polio, and MCV. According to the Centre for Gender Equality in Iceland, in 2011, all girls

aged 12 will receive vaccination against HPV infections and cervical cancer.

UNICEF's statistics on Icelandic education are also encouraging. From 2008 to 2012, the gross enrollment ratio of males in preprimary education was 97.8 percent, and the same statistic for their female counterparts was 95.5 percent. Primary school enrollment for males for the same period was 98.8 percent, and for females, it was 99.3 percent. Numbers dropped for secondary school enrollment rates for the period 2008–2012. The net enrollment rate for males in secondary school for that period was 87.8 percent; for females, it was 89.1 percent (UNICEF 2016).

Sex Education and Teen Pregnancy

As part of mandatory education, Icelandic law mandates that sex education be taught. This includes education regarding sexuality, sexual ethics, and sexual diseases and protection. Icelandic girls lose their virginity sooner than in other European countries; Iceland has the highest rate of teen pregnancy (24 births for every 1,000 teenagers) of all the Nordic countries and one of the highest rates of teen pregnancy in the world. However, that rate is dropping due to increased sex education and access to birth control (UNICEF 2016).

Health

In Iceland, there is no private health sector; instead, all citizens, regardless of status, qualify for health care under the state health care service (Europe-cities 2016). Health care is universal, paid for mostly by taxes, and administered by the Ministry of Welfare; private insurance is practically nonexistent in Iceland. The National Hospital opened in 1930. There are 3.46 physicians for every 1,000 persons in Iceland. On the whole, Iceland's health care system is one of the best in the world, ranked 15th by the World Health Organization (WHO 2000). Icelanders are among the world's healthiest citizens, with 81 percent reporting they are in good health. Iceland has one of the lowest infant and maternal mortality rates in the world.

Sexually Transmitted Diseases

The number of registered cases of sexually transmitted diseases (STDs) in Iceland has increased in recent years, especially in registered cases of gonorrhea. As of 2009, there were less than 100 deaths related to HIV/AIDS. In 2002, there were only 35 deaths from HIV/AIDS-related

causes. There are fewer than 1,000 people living with HIV/AIDS in Iceland, with the prevalence rate being 0.3 percent of the adult population. Among individuals with HIV, the ratio of women and men is quite different and has also changed substantially in the last few years. In the period between 1996 and 2008, men were usually in the majority of HIV infected, but in 2009, of the total 13 infected, 3 were men and 10 were women (Center for Gender Equality in Iceland 2012).

Cancer

The Directorate of Health oversees compulsory cancer registration in Iceland. One in three Icelanders will be diagnosed with cancer in his or her lifetime. Cancer causes 25 percent of deaths in Iceland. After menopause, cancer is more common among women, while more men die of cancer at a younger age. Fifty percent of cancer is diagnosed after age 65 in Iceland. As of 2003, incidents of breast cancer are increasing, and cervical cancer is reported in less than 30 women annually (Center for Gender Equality in Iceland 2012).

Reproductive Health

The use of contraception is less common in Iceland than in other Scandinavian countries. In 1975, a law was passed to make access to contraceptives and abortion easier for women. Abortion in Iceland is permitted based on medical criteria and social conditions before the 12th week of pregnancy. After the 16th week, abortions are only permitted if the health of the mother is in jeopardy or if fetal deformity is present. Abortions are not available on request, but they may be performed to save the life of the woman, to preserve physical health and mental health, in the case of rape or incest, in the case of fetal impairment, or for economic or social reasons. Two physicians must submit a written report in support of an abortion. In the case of social conditions, a physician and a social worker must certify the abortion. In Iceland, almost every pregnant woman screens for Down syndrome, and 100 percent of women who have a positive diagnosis now terminate their pregnancies (Gee 2016). According to the Directorate of Health in Iceland, abortions have been on the increase every year since 2004, with most cases of abortion attributed to social conditions.

Depression

In 2015, Iceland had the fourth-highest proportion of people with depressive systems among all European

nations (European Health Interview Survey 2015). Icelandic women suffer more frequently from depression than Icelandic men, with 20 percent of women suffering from depression in comparison to 10 percent of men. The gender gap is largest among 15–24 year olds and people aged 65 years and over. Compared to other European countries, young Icelandic women are more likely to report depressive symptoms (EHIS 2015).

Education

With the literacy rate in Iceland at nearly 99 percent for Icelandic children over the age of 15, the country's educational system is generally considered one of the best in the world. The core principal of the Icelandic educational system is that every person should have equal opportunities to acquire an education, regardless of gender. However, this does not necessarily translate to equal access to education for all, especially outside of Reykjavik. This is not necessarily due to gender inequality, but rather because of the remote geographic conditions in much of Iceland. Especially with university-level education, most study programs are only available in the capital area of Reykjavik as face-to-face study. However, the range of remote and distance learning programs in Iceland is increasing (Faber et al. 2016). There is a marked difference between educational culture and attitudes in the capital area versus the rural areas that make up the majority of the country.

In general, however, educational conditions in Iceland are quite progressive. Icelandic women have equal access to education and are strongly represented in the educational system. Among the Nordic countries, Iceland has the second-highest percentage of university students, and women make up the majority of students. In 2013, women accounted for 64 percent of the graduates from universities (Haagensen 2014).

Rural Education

The educational system in Iceland is unique in that there are many small rural schools in the country—this is defined as schools with fewer than 120 students. In 2014, small rural schools accounted for approximately one-third of schools in Iceland (Wildy et al. 2014). In fact, the current understanding of a “school” is a relatively new conception in Iceland. Although compulsory schooling was introduced in 1936, up until the 1960s, it was still common for children in rural areas to stay at home and help the family

rather than attending school. This continues to affect the attitude toward education in rural areas of Iceland today.

Studies of Icelandic educational conditions in rural areas have found that a general school culture of acceptance exists in these areas (Wildy et al. 2014). This “culture of acceptance” means that there is a general attitude that every child should have equal access to a good and solid education. However, these studies note that, especially in rural Iceland, the “culture of acceptance” may keep teachers and communities from more exploratory approaches to teaching that might question traditions and norms. This could translate to the educational system in rural areas being less likely to question conventional gender roles and standards.

University Education

The University of Iceland was founded in 1911, and in the same year, Iceland passed a law to enforce equal access to education and work for women. Education is cheaper in Iceland than in other European countries, but the government has recently cut collegiate education from four years to three years.

More women than men earn university degrees in Iceland, although PhD studies are more gender balanced. Sixty-six percent of the graduates at the University of Iceland were women in the 2008–2009 academic year, and of those who earned graduate or master’s degrees, women accounted for 60 percent of the population. This reflects the gender distribution in the larger university system in Iceland as well, where women account for 64 percent of the graduates from all Icelandic universities (Haa-gensen 2014). This overrepresentation of women in the Icelandic university system could be due to the fact that the Icelandic government does not provide financial support to students. For those who see opportunities in the local labor market that do not require a university degree, especially men, it may appear more attractive economically to leave school early and pursue paid work (Faber et al. 2016).

Teaching

Although women are overrepresented in the Icelandic educational system as students—especially in universities, where they make up the majority of students—women continue to be underrepresented in teaching positions. In universities, for example, Icelandic women continue to hold a minority position in teaching roles. In 2010, women

represented only 25 percent of all university professorships in Iceland (Heijstra 2013). This disparity reflects a larger gender gap in the economic sector of Iceland, where women are overwhelmingly overrepresented in public-sector social service jobs, including teaching.

Employment

The labor market in Iceland, as with most other social sectors, is largely divided between the urban and the rural areas. Over the last decade, Iceland has been transitioning from an industry-based labor market to a knowledge-based labor market. However, many rural areas of Iceland are still reliant on an industry-based economy. Traditionally, men have held these industrial jobs in Iceland. As such, although the Icelandic economy is undergoing a shift away from industry-based labor, the labor market in Iceland remains highly gender segregated (Faber et al. 2016).

Professional Workforce

While women make up a large majority of those working in the public sector in Iceland, mostly in caretaking, teaching, and other services, male employees dominate in the private sector, particularly in the primary area of this sector, which includes agriculture, fishing, and manufacturing. Men also hold most of the top positions in the finance sector in Iceland (Center for Gender Equality in Iceland 2012). Researchers believe this gender division is largely a result of the education system, where Icelanders tend to make education and career choices by excluding certain careers based on their gender. For example, women are less likely to pursue a career in construction or fishing because, traditionally, men have dominated these economic sectors. However, this trend is shifting, with more Icelandic women beginning to choose traditionally male jobs. This trend has not necessarily worked the opposite way, though, as men have not to a similar extent sought employment in jobs that have traditionally been held by women, such as teaching or caretaking.

In Iceland, all companies with 25 employees or more have been required by the Icelandic parliament since 1993 to have a gender equality policy, and the Centre for Gender Equality in Iceland is allowed to fine companies that have not put such a policy in place (Icelandic Women’s Rights Association 2016). However, this has not necessarily resulted in gender equality across the labor sectors in Iceland. Despite this equality plan, the Icelandic

parliament has never actively attempted to alter the distribution of men versus women in traditionally female jobs, such as those within the social care sector. Instead, the emphasis has been on increasing the recruitment of women to traditionally male jobs. For example, in 2011, the proportion of male students in nursing education systems was less than 5 percent. Thus, while Icelandic women have made substantial strides in entering fields historically dominated by men, the reverse has not been true, leaving women to be responsible for the majority of public-sector jobs.

The Icelandic labor market is also characterized by unequal pay, as Icelandic women are paid less than Icelandic men. The largest gender pay gaps are found in the rural and peripheral areas of Iceland, where men earn on average 38 percent more than women. In metropolitan areas, Icelandic men make on average 10 percent more than Icelandic women (Center for Gender Equality 2014). This pay gap remains, despite efforts on the part of the Icelandic government, which created an Equal Rights Monitoring group in 2008 to monitor gender equality and the economic status of men versus women.

Parental Leave

Parental leave is one area of gender equality in which Iceland has been used as a global model because of the country's progressive stance. In 1975, salaried women in Iceland who were new mothers were entitled to three months of paid leave. In 1987, this leave was extended to six months. In 1998, new fathers were entitled to two weeks of paid paternity leave. In 2013, Iceland passed a law that grants three months of nontransferable parental leave to both mothers and fathers, with an additional three months of leave granted to the couple to share as they choose. The law was soon reformed with a 5-2-5 policy, with mothers and fathers each entitled to five months of leave and an additional two months of paid leave. Research has found the law to be a success, with nearly 90 percent of Icelandic fathers taking parental leave (Gunn 2013). Researchers have also concluded that this policy has affected larger issues of gender equality in Iceland; there has been more equality between men and women at work because of equal distributions of parental leave. The law also may have long-term effects on how men and women share household and child care duties, with men spending more time on domestic work and women spending more time in the professional workforce after being exposed to this policy.

Family Life

In Iceland, where women have made major strides toward gender equality in the realms of politics and education, there is still a relatively conservative stance when it comes to gender roles in the home. This is largely due to long-standing, traditional views on Icelandic women's role in society, which have been slow to change, especially in the rural areas that make up the majority of the nation. This even holds true for the younger generations of Icelanders. For example, in a recent study of Icelandic youth aged 16–19, a considerable percentage displayed conservative views on issues of gender equality. When asked whether women should stay at home and take care of the children, 46 percent of male youth agreed (Center for Gender Equality 2012). Negative attitudes toward gender equality and feminism seem to be accepted among many youths in Iceland, especially males. The widespread perception of Icelandic women and their role in society can be seen as an invisible yet powerful barrier preventing women from gaining social equality in Iceland.

Marriage and Divorce

In Iceland, marriage rates are low, and divorce rates are rising. Iceland has the highest divorce rate in Europe. "Merged families" are also increasing with remarriage and stepfamilies on the rise. In Iceland, civil marriage is administered in the capital by the Reykjavik District Commissioner and requires documentation that includes a birth certificate, a certificate of marital status, and a valid passport. There are other documents and paperwork required. Civil marriage is available to gay or straight couples as long as they are not already married (Iceland.is 2017).

Household Roles and Responsibilities

In Iceland, women spend significantly more time on unpaid household work than men. Unpaid work is defined as productive activities that are necessary for the functioning of society but have no remuneration. This includes domestic and family work, such as housework and caring for children and elderly family members. This is especially true in the rural communities of Iceland, where there is substantially more unpaid household work, which women are overwhelmingly expected to perform (Faber et al. 2016). One factor contributing to this gender disparity in unpaid household work could be that men in peripheral areas of Iceland are increasingly commuting long distances for work, leaving women to be responsible for caretaking in the home.

Politics

Although Iceland is a relatively progressive nation, it was one of the last Nordic countries to grant women the right to vote, in 1920, which is also when Icelandic women were granted the right to hold national office. However, since that time, the representation of women in the Icelandic Parliament has steadily increased. Today, Iceland has one of the highest levels of gender equality in terms of political representation in the world. The first female cabinet minister of Iceland was appointed in 1970 and the first female prime minister in 2009.

Suffrage and Political Parties

As far back as 1882, unmarried Icelandic women over the age of 25 who paid taxes as well as widows had the right to vote in local elections. In 1908, women were allowed to run for office for the first time. In 1922, the first woman was elected to Parliament.

Iceland was the first country in the world with a political party formed and led entirely by women. Founded in 1983,

the Women's Alliance, or Women's List Party, was founded specifically to advance the political, economic, and social interests of women. The party was active in Icelandic politics from 1982 to 1996 and helped to increase the proportion of female parliamentarians by 15 percent. In 1999, the Women's Alliance Party merged with other political parties on the Left to form the Social Democratic Alliance Party. Although the party is now disbanded, it had a strong effect on Icelandic politics. In 2017, every major party in Iceland has a 40 percent quota for women, and women make up 48 percent of the members of parliament (IPU 2017).

LGBTQ Rights

Iceland is considered a liberal nation when it comes to LGBTQ rights. On June 27, 1996, the Icelandic Parliament passed legislation to create registered partnerships for same-sex couples, which conferred nearly all the rights and benefits of marriage. In the year 2000, lesbians and gays in registered partnerships were allowed the right to step-adoptions. In 2006, same-sex couples were granted the same rights as heterosexual couples in adoption,

Women's Voices

Jóhanna Sigurðardóttir

Born in Reykjavik in October 1942, Jóhanna Sigurðardóttir became prime minister of Iceland in 2009. Her victory not only opened doors for other women because she was the first woman in the office, but it also opened doors for gays and lesbians because she was the first openly gay head of government in the country.

Sigurðardóttir began her political career as an activist working within labor unions. As a social justice advocate, she fought for welfare reforms and for political party realignment, which led to the ultimate creation of the Social Democratic Alliance. It is from this party that she sought and won the prime minister seat and began the role that she would leave behind in September 2012 as the longest-serving member of Parliament (1978–2012).

Sigurðardóttir married her partner, Jónína Leósdóttir, on June 27, 2010, the day gay marriage became legal in Iceland. Of her legacy, it is said, "No matter what one thinks of Sigurðardóttir's politics, she played a historically important role. Having an openly gay national leader, even in a small country such as Iceland, sends a clear message to everyone, wherever they live—'If we can do it, you can too'" (Gay Iceland 2013).

parenting, and assisted insemination treatment. Finally, on June 11, 2010, lesbian and gay marriage was legalized, with the Icelandic Parliament amending the country's marriage law to make it gender neutral. This made Iceland one of the first countries in the world to legalize same-sex marriage. The National Church of Iceland also recognizes gay marriage.

Inheritance and Property Rights

In 1850, Icelandic daughters were entitled to the same inheritance rights as sons. Up until that point, daughters only had the right to one-third of the family inheritance. In 1861, unmarried women over the age of 25 retained majority rights, but married women relied on their husbands and were not granted full legal rights as citizens. In 1900, Icelandic women gained legal rights to control their own income and property.

Gender Equality in Legislation

In 2008, the Icelandic government passed the Gender Equality Act, which included the creation of the Centre for Gender Equality and allowed the government greater authority in dealing with gender discrimination and other gender issues. According to the shadow report by ICEHR and IWRA, the last Government Equality Action Plan was valid until the end of 2014, and a new one has not yet been accepted as stipulated by the Gender Equality Act (Icelandic Human Rights Center 2016).

Religious Roles

The majority of the population in Iceland belongs to the National Church of Iceland, or the Evangelical Lutheran Church of Iceland (ELCI). At present, 90 percent of the population is Lutheran, of which 85 percent belong to the ELCI and 5 percent to Lutheran free congregations (World Council of Churches 2016). One-third of the pastors in the ELCI are women, and 66 percent of the bishops are female. Kvenna Kirkjan, or the Women's Church, was founded in 1993 as an independent group within the National Church by the Reverend Audur Eir Vilhjalmsdottir, the first woman ordained in the Lutheran Church of Iceland. The Women's Church was founded on the feminist principles of inclusivity and participation. Although it officially functions as part of the National Church, Kvenna Kirkjan acts on its own. The group holds monthly services in churches across Iceland and has creatively translated some biblical texts

into nongendered language; for example, it has rendered the masculine word "disciple" as "male and female friends of Jesus" (Keller et al. 2006).

Issues

The Icelandic Shadow Report for CEDAW introduces several initiatives and measures that the government might make to improve the lives of women in Iceland. This list includes a lack of an action plan against domestic and sexual violence, more funding for an action plan against trafficking in human beings, more funding for the Parental Leave Fund, a plan to continue the government's revision of the National Curricula of compulsory and secondary school, a plan to make gender studies a required course at all levels, and a plan to review the legislation on abortion to fully support women's agency and choice. These are the issues facing Icelanders today, not to mention the wage gap and the employment gap that women continue to face in Iceland.

Depending on the field, the wage gap can be anywhere from 6 percent to 16 percent. While they attend university and have more education than their male counterparts, women in Iceland continue to work in lower-paying fields, such as teaching, while the men work in more profitable fields, such as finance. There is much to be done to sustain Iceland's reputation as the most feminist country in the world, although the groundwork is in place. Icelanders can look forward to a successful 21st century if they continue on the path they have broken for themselves with the implementation of CEDAW, the creation of the Center for Gender Equality and the provisions made for gay, lesbian, and transgender rights.

Violence against Women

In the 1980s, feminist groups in Iceland increased the public's awareness of domestic and sexual violence. The first women's shelter was opened in Reykjavik in 1982, and in 1990, a center for survivors of sexual violence opened. In 2011, Iceland's Parliament passed a law allowing for stricter provisions and protections for victims of domestic violence and rape. There is a special restraining order that can be put in place should such violence occur. Kvennaathvarf, the Women's Shelter in Reykjavik, offers services to women and children who have suffered abuse in their own homes. Immigrant women represent a large number of those seeking shelter due to domestic violence. Stigamot,

the Icelandic Counseling and Information Center for Survivors of Sexual Violence, is based in Reykjavik and offers counseling and education services to survivors of all ages. Children under the age of 18 are welcome once a report has been filed with Child Protective Services.

Ireland

Overview of Country

The Republic of Ireland has existed since 1922. It is made up of 26 counties and is home to 4,761,865 people, according to the 2016 census (CSO 2017a). In the years since it achieved independence from the United Kingdom, the Republic of Ireland has undergone a period of profound transformation, from an agricultural, traditional, rural, and monocultural society to an industrialized, modern, urban, and multicultural one. The impetus for such change was influenced by internal as well as external factors. Irish women have been the major recipients of this social change, but they have not been passive bystanders. In some instances, Irish women worked collectively to help instigate some of this change, especially in the areas of reproductive rights. However, there are still areas that need to be addressed, such as child care and political representation.

Demography in the 21st Century

The 2017 census of 4,761,865 people marks the largest population in Ireland recorded since the 1901 census (CSO 2013c). The number of Irish children under the age of 14 in 2016 stands at 1,000,652 (CSO 2017b). This represents the third time since 1987 that the 1 million mark has been

broken by this age group (CSO 2013b). As a result, Ireland has an emerging youth population. There are more women than men in the country, with 97.8 males for every 100 females (CSO 2017c, 24). However, this gender ratio is unevenly distributed across age, with more boys than girls among those aged 18 or younger, and more females to males in the 24 to 65 (CSO 2017c, 24). Life expectancy at birth also shows a gender difference. Women, on average, have a life expectancy of 82 years, whereas Irish men are expected to live until they are 77.3 (WHO Europe 2013). As women on average live longer than men, there are more elderly women in Ireland. For example, there are 52 men to every 100 women over the age of 85 (CSO 2017c, 20).

Since 2000, Ireland has experienced an increase in its birth and fertility rates. The Irish birth rate (per 1,000 population) in 2000 was 14.5 (CSO 2013a), and it grew steadily to a peak of 16.7 in 2009. Since then, the birth rate has slowly fallen, and by 2012, it was 15.8 (Department of Health 2013, 9). Irish total fertility rates (TFR) for the same period also show signs of growth: in 2001, Irish TFR was 1.98 (Martin and Kats 2003, 4); by 2009, it was 2.06; and by 2012, it was 2.01. Ireland's TFR is higher than that of EU member states as a whole (Department of Health 2013, 9).

The infant mortality rate (per 1,000 live births) has fallen over the past decade. In 2003, the Irish infant mortality rate was 5.3, whereas it was 3.5 in 2012 (Department of Health 2013, 22). Ireland has one of the lowest rates of maternal and perinatal mortality rates in the world (Larkin, Begley, and Devane 2012, 98), and so it is assumed to be one of the safest places to give birth. Under the 1954 Maternity and Infant Care Scheme, pregnant women are offered free medical and dental care for the duration of their pregnancy and up to six weeks after childbirth. As a result, maternity services in Ireland are free for all women who meet residency requirements (Kennedy 2010, 146). Hospital births are the norm in Ireland, with only 200 home births recorded in 2011 (O'Boyle 2013, 988).

The peculiarity of Irish birth and fertility rates needs to be interpreted. In 1981, the population of Ireland was just over 3.3 million (CSO 2013c). From 1980 to 1994, the birth rate fell by 33.3 percent (Ferriter 2008, 190), from 21.8 to 13.5 (CSO 2013a). Also, the probability of women marrying fell from 90 percent in 1975 to 60 percent in 1995 (Ferriter 2008, 190). However, since 1994, Irish society has undergone a phase of accelerated economic growth. From 1994 to 2008, the Republic of Ireland experienced a period of unprecedented economic growth and prosperity that resulted in high employment levels (68.1% in 2006), strong

economic productivity, and good standards of living. This period in Ireland's recent economic history is called the "Celtic Tiger." By 2005, Ireland was the second-wealthiest country in Europe after Luxembourg in terms of gross domestic product (GDP) (Kirby 2008, 19).

During this time, the population steadily increased, from 3,626,087 in 1996 to 4,239,848 in 2006 (CSO 2013c). There are two main reasons put forward to explain this population increase. First, this development can be attributed to a natural increase in the population. In 1980, the birth rate in the Republic of Ireland reached an unprecedented high of 74,064 births. This equated to a birth rate of 21.8 (CSO 2013a). It is reasonable to surmise that the coming-of-age of this birth cohort could explain this population growth. Second, because the demand for labor for the Celtic Tiger could not be matched by the domestic population, Ireland became an ideal destination for economic migrants from all over Europe, but especially Eastern Europe, and beyond. From 2005 to 2008, Ireland experienced a peak in inward migration. For instance, in 2006 alone, 60,300 males migrated to Ireland, and in 2007, 52,100 female migrants came to Ireland (CSO 2012c, 11). As a result, Ireland has become more ethnically and linguistically diverse. By the 2011 census, more than 100 different nationalities were shown to reside in Ireland.

It is clear to see how Ireland's economic boom contributed to the emergence of a different demographic pattern. However, it must be noted that Ireland was hit by a crippling economic recession in 2009, which was caused by an overheated housing market, a poorly regulated banking sector, and the onset of a global recession. A strict policy of austerity has since been adopted in relation to all state expenditures (*The Economist* 2013). These economic factors have had an impact on Irish demographic trends, with the 2006 and 2011 population change rates falling from 8.2 percent to 3.8 percent in the 2016 census. Despite this decline, Ireland recorded a positive natural increase of 196,100 from 2011 to 2016 (CSO 2017c, 9). Over this same period, net migration fell to -22,500 (net outward flow) (CSO 2017c, 10). This represents the first time since 1986–1991 inter-census period when net outward migration was so low. During the peak years of the Celtic Tiger (2006–2011) net inward migration was 115,800 (CSO 2017c, 10).

Girls and Teens

We have already mentioned that Ireland has one of the youngest age profiles in Europe. As a result, it is important

to reflect on the experiences of childhood and adolescence in Ireland. According to UNICEF indicators for children's well-being, Ireland has an overall ranking of 10.2, placing it 9th in terms of education and well-being, 7th for family and peer relations, and 19th for material well-being and health and safety (Cullen 2013, 31). In Ireland, education is highly valued, which is reflected in the high educational attainment of its population. In 2010, 1,103,000 Irish children and adults were enrolled in all levels of education, from primary to tertiary education (Cullen 2013, 26). Of people aged between 15 and 64, 71.7 percent had attained higher secondary level education or above in 2014 (CSO 2015). In fact, the average Irish person spends 17.7 years in education, slightly above the EU average of 17.3 years (26).

The primary school completion rate for girls is slightly higher than for boys, at 95.9 percent and 94.9 percent, respectively (Hiraga and Posadas 2013). In 2011, Ireland took part in the Programme in International Reading Literacy Study (PIRLS) to assess the reading abilities of fifth graders in reading, earning an average reading score of 552, on par with the United States and Great Britain.

Secondary-level education has been free to all since 1966 (Ryan 2010, 327). Prior to that, an educational inequality pervaded among the lower classes, with only middle- and upper-class families sending their children to secondary education. However, since then, attainment of secondary-level education has continued to improve, and by 2011, 89 percent of the Irish population was expected to complete upper secondary education (OECD 2013b). Despite this affirming statistic, research suggests that educational attainment at the secondary level is somewhat differentially experienced according to gender. In 2009, Irish literacy rates among 15-year-olds were measured by the Programme for International Student Assessment (PISA). It revealed a mean reading score of 495.6, which is consistent with the OECD average. Ireland placed 21st out of 65 participating countries and 17th compared to those in the OECD (Cullen 2013, 26). At age 15, Irish girls, on average, score 515 points in PISA reading assessments, whereas Irish boys score 476 points (OECD 2013c). Furthermore, more boys than girls are ranked in the poor reading skills category. Though 23.2 percent of teenage boys had poor reading skills, 11.3 percent of teenage girls also had poor reading skills (Cullen 2013, 26).

In 2010, the early school dropout rate was 12.6 percent for boys and 8.4 percent for girls (CSO 2012c, 10). The decision to leave school at the secondary level has direct economic impact: 21.7 percent of 25–64 year olds with less

than an upper secondary education were unemployed in 2011. This level of unemployment is nearly three times the prerecession unemployment figure in 2008 of 8.2 percent (OECD 2013b). For women, 14.2 percent of those with less than a secondary education are currently unemployed.

Performance in state examinations at the secondary level also reveals a gendered trend. In 2011, boys scored higher in math, physics, construction studies, and engineering subjects in their Leaving Certificate exam results, whereas girls scored higher in English, Irish, French, biology, chemistry, art, and music (CSO 2012c, 10). Structural and cultural factors have as much a part to play in explaining this divergent trend as an argument about “natural ability.” Research by Darmody and Smyth (2005) found that there is still profound gender stereotyping in the subject choices that students make in Irish secondary schools. They established that male students are overrepresented in material technology, metal work, and technical graphics subjects. This was attributed to a number of reasons: First, not all schools offer a full complement of subjects. In this way, the whole student body is presented with restricted choice. As a consequence, smaller and single-sex schools tend to adopt a gendered approach to subjects being provided. Second, even when technology-related subjects are offered, girls are less likely than boys to take them up. This lack of uptake can be due to scheduling clashes that place “traditionally female” subjects such as home economics at the same time as technology subjects as well as peer pressure. Preconceived notions, such as technological subjects are “dirty” and require physical strength, can prevent girls from choosing to pursue these courses. These reasons point to the persistence of gender stereotyping in the choice of subjects in secondary school (Darmody and Smyth 2005).

This gender stereotyping appears to continue when students pursue third-level education. In 2011, the majority of engineering, manufacturing, construction, and science graduates were male, whereas 82 percent of health and welfare graduates, 74 percent of education graduates, and 63 percent of arts and humanities graduates were female (CSO 2012c, 10). Despite this gender stereotyping, Irish women are more likely to have a third-level qualification than Irish men. This trend first emerged at the turn of the 21st century. In 2000, the percentage of the population aged between 25 and 34 with a third-level education was 29.6 percent, 31.1 percent females and 28.1 percent of males (CSO 2003, 43). By 2011, 53 percent of women between the ages of 25 and 34 had a third-level qualification as opposed to 39 percent of men of the same age (CSO

2012c, 10). By 2013, the percentage of females aged 25–34 years with tertiary qualifications was 55.3 percent and 42.7 percent for males (CSO 2013d, 4.4).

Such educational success offers women a number of protections and status in society. Participating in education has a positive impact on people’s employability, income levels, and occupation (Carnoy 2000; Schuller 2004, 3). Before the onset of the current recession in 2008, only 2.7 percent of female university graduates were unemployed. However, in 2011, this had risen to 6.3 percent (OECD 2013b). However, the unemployment rate for men is more pronounced. For men with a college education, their respective unemployment rates were 3 percent in 2008 and 7.1 percent in 2011 (OECD 2013b). Clearly, the more qualified women are the more protected they can be in times of economic crisis.

Employment

It has already been noted that Irish women have more educational qualifications than Irish men. However, only 63 percent of Irish women and 77 percent of Irish men enter the workforce once they have completed their education (OECD 2013c). As a result, there are slightly more men than women currently in the workplace, to a ratio of 0.80 (WEF 2013, 228). According to *The Global Gender Gap Report 2013* (WEF 2013), 52 percent of Irish women are employed in the nonagriculture sector (228). It also reveals that more Irish women than men work part-time, with 39 percent of all Irish female workers in part-time employment as opposed to 13 percent of all employed men (228). Most Irish women work in professional occupations (23.7%), and 20.9 percent work in administration and secretarial occupations. Men, on the other hand, are more represented in the skilled trades sector (24.7%), and 15 percent are in the professions (CSO 2012c, 11). Women are also overrepresented in the health and education sectors. Four out of every five people who worked in the health sector in 2010 were female (11). However, only 36 percent of women are consultants, 53 percent of primary school teachers are managers, and 41 percent of secondary school teachers are managers (11). Construction, agriculture, and transports remain male-dominated occupations (11).

It has been estimated that women do more unpaid work than men. The OECD (2013c) reports that Irish women perform 296 minutes of unpaid work every day, and Irish men perform 129 minutes of unpaid labor per day. Recent research suggests that there is a 10 percent income gap

between men and women in Ireland (OECD 2013c). However, one report has claimed that Irish women typically earn 30,457 euros (approximately \$35,212 US) per annum as opposed to 40,000 euros (approximately \$46,245 US) for men (WEF 2013, 228). This brief snapshot of the employment opportunities of Irish women reveals a picture not dissimilar to other developed Western countries, one that demonstrates the existence of horizontal and vertical segregation, a gender pay gap, and higher rates of female part-time employment and work arrangements.

While each of these features denotes the existence of employment inequality, it is worth noting how much progress there has been in terms of women's economic participation in Ireland. Irish feminists have repeatedly highlighted the extent to which Ireland's economic development has historically been at the expense of women's full participation in the workplace. This "patriarchal state policy" (Mahon 1994, 1285) dates to the early years of the Irish Free State. For instance, in 1929, the Marriage Bar Act was instated, which stipulated that female civil servants had to give up their jobs when they married. The Conditions of Employment Act (1935) restricted the number of hours that women could work in any employment sector (Mahon 1994, 1283) and curtailed women's industrial opportunities in the textile, shoe production, and confectionary industries (Mahon 1994, 1283). Even as late as 1969, the Irish Development Authority, whose role is to source and support foreign industrial development in Ireland, stipulated as one of the conditions of its lucrative financial packages that the workforce of any new industry should be 75 percent male (Mahon 1994, 1285). These, among other social, ideological, and political factors (which will be discussed in the following sections), were successful in keeping women's employment participation rates low for the majority of the 20th century.

Though Ireland's membership in the then European Economic Community (now called the European Union) in 1973 brought with it a decade of progressive employment equality legislation that overturned the previous decade's discriminatory employment practices, such as the removal of the Marriage Bar from 1973–1977, and introduced more employment protections for women, such as the Employment Legislation (Equal Pay) Act in 1974, the Equal Treatment Act in 1977, and the Protection of Employee Act (maternity leave) in 1981 (Mahon 1994, 1286), the number of Irish women in the workforce was still at 31 percent in 1986, 1 percent below the 1926 participation rates (O'Sullivan 2012, 223).

Since the 1990s, the number of women participating in the labor force has steadily increased. In 1994, it stood at 40 percent; by 2002, it was 55.2 percent; and by 2008, it was 60.5 percent (O'Sullivan 2012, 223). Interestingly, it was during this period of economic growth that women working in the home fell, and by 2005, only 33 percent of women stated that they worked in the home, the first time in the state's history when working in the home was not the main occupational status of Irish women (O'Sullivan 2012, 223). It has been reported that 90 percent of the increase in the Irish labor force participation rate from 1990 to 2006 was due to female uptake (O'Sullivan 2012, 223). This has led many to ascertain that the Celtic Tiger was in fact a "Celtic tigress" (O'Sullivan 2012, 223).

The increase in women's participation during this time was also, for the first time observed, among married women. Though the number of working mothers in formal employment had been rising since 1986 (O'Sullivan 2012, 223), in 2004, only 52.4 percent of women in the workforce had children under four years old, and 87.2 percent had no children (O'Sullivan 2012, 223). Married women's participation in the workforce has also increased in the past three decades. In 1986, the participation rate for married women stood at 34 percent (O'Sullivan 2012, 223), and by the summer of 2005, it was at 51.2 percent (O'Sullivan 2012, 223). The working pattern of women also shows an interesting development over time: Irish women are more likely to work part-time than Irish men. In 1992, 18.7 percent of women worked part-time, a figure that rose to 20.5 percent in 2002. By comparison, only 3.8 percent of men worked part-time in 1992 and 6.5 percent in 2002 (O'Sullivan 2012, 224). Irish women also have care and domestic responsibilities (Hilliard 2006; O'Sullivan 2012, 224), with the majority of those working outside the home doing the "second shift" (O'Sullivan 2012, 224).

Family Life

A particular model of family life is enshrined in the Irish Constitution. Article 41 states the following:

Article 41.1. The State recognises the Family as the natural primary and fundamental unit group of Society, and as a moral institution possessing inalienable and imprescriptible rights, antecedent and superior to all positive law.

Article 41.2. The State, therefore, guarantees to protect the Family in its constitution and authority, as the

necessary basis of social order and as indispensable to the welfare of the Nation and the State.

The constitution asserts a functionalist understanding of the family as a key institution to society. It goes on to affirm that the marital nuclear family is deemed to be the ideal family type for Irish society.

While the marital nuclear family unit remains the most prevalent family type in Ireland, there is increasing evidence of the emergence of alternative family forms. One in every six families, or 16 percent of families in 2006, were one-parent families (CSO 2007). This rose to approximately 18.2 percent according to the 2011 census (215,315 households) (CSO 2012b), and again in 2016 when 218,817 households were single-parent households, 86.4 percent of which were female-headed (CSO 2017a). The majority of these one-parent families in 2011 had children over the age of 15 residing with them (CSO 2012b). Single-parent households are more at risk of poverty than other family types, with only 42.5 percent of single parents employed (CSO 2012b). There has also been an increase in the number of families with children where the parents are not married. Only 23,000 cohabiting families were recorded in 1996, but by 2011, this had risen to 60,269 (CSO 2012b) and again to 75,452 in 2016 (CSO 2017c, 41). While family forms are changing, the ideology of family and marriage is still strong in Irish society (Byrne 2008, 30; Inglis 2005).

Despite these changes, the consistent finding is that Irish women still appear to be assuming the care responsibility for their children (Drew and Humbert 2012, 49). Though Irish family sizes are falling—from 2.2 children in 1986 to 1.38 children in 2011 and 2016 to (CSO 2012b, CSO 2017c)—a gendered division of labor continues. Based on the analysis of 600 diaries, McGinnity and Russell (2008) found that Irish men spend most of their time in paid employment, whereas women spend more time on caring and household work. The division of domestic labor was also gendered, with most men performing household repairs and gardening while women were preoccupied with cleaning, cooking, and shopping for the household (McGinnity and Russell 2008, x). The gender gap becomes more pronounced on weekends, when “women’s unpaid work and caring time remains virtually unchanged,” resulting in less leisure time for women (x). There is a further asymmetry to child care labor: Men are more likely to perform the “social/emotional caring” whereas women are left with “physical care/supervision” tasks (x). In sum, this research reiterates the existence of a “second shift” for Irish

women with children (McGinnity and Russell 2008, xi). In fact, Drew and Daverth (2007, 13) surmise that “there has been little progress towards dual roles for working fathers,” and as a result, “asymmetrical family roles” (14) continue.

Another major change in Irish family form has been the introduction of divorce in 1997. In 1986, the first divorce referendum was defeated by 63.5 percent of the vote (Ferriter 2008, 198). However, in recognition of the need for action on marital breakdowns, the first judicial separation was granted in 1989 (Crowley 2011, 229). By 1996, there were 87,800 separated people in Ireland (CSO 2012a). By 2006, the figure was 166,799 (Crowley 2011, 228). In 1997, a second divorce referendum was called and voted in on the narrowest of margins (Ferriter 2008, 198). Nevertheless, a strict divorce legislation was agreed on, whereby divorce could only be granted after a couple was legally separated for at least five years. Despite this, the number of divorced people is rising, from 87,770 in 2011 to 103,895 in 2016 (CSO 2012a, CSO 2017c, 33).

Politics

For the first 90 years of the Republic of Ireland, the political aspirations of Irish women have been largely unfulfilled, with women remaining broadly underrepresented in elected offices. A female cabinet minister, Constance Markievicz, was in the first Parliament in 1919. However, it would be another 60 years before another woman, Maire Geoghan-Quinn, was named as a government minister (Ferriter 2008, 188). Since then, the number of women running for and being elected to public office has slowly increased. In 2011, only 15.1 percent of Teachta Dála (TDs, or elected representatives) and a third of state board members were women. Only a fifth of local authority councils and a third of Vocational Educational Committee (VEC) boards had women members (CSO 2012c, 10). However, the EU average for female representation in national parliament is 25 percent (10).

The elections of Mary Robinson as Ireland’s first female president in 1990 and Mary McAleese as president of Ireland in 1997 and again in 2004 are deemed by some to mark the beginning of a liberalization in Irish society (Cronin 2004, 251) and the emergence of a public discourse about and recognition of equality. Though the role of the president is a largely ceremonial and symbolic one (Article 13, *Bunreacht na hÉireann*), gender inequalities in EU leadership positions exist in both public and political sectors, so the election of two female presidents in Ireland in recent

Women's Voices

Mairead Corrigan-Maguire and Betty Williams-Perkins

Mairead Corrigan and Betty Williams created the Women of Peace movement (later the Community of Peace People and Peace People Organization) in August 1976 in Belfast, Ireland, at the funeral of the three Maguire children (children of Corrigan's sister) who were killed by a runaway car when its IRA driver was gunned down by the British Army. Corrigan's work was shaped by her involvement in her youth with the Legion of Mary, a Catholic volunteer organization devoted to bringing the teachings of the church to the masses.

The movement began with a march of 50 Belfast women pushing baby carriages in protest in Andersontown, where the deaths occurred, followed by Williams' gathering of over 6,000 signatures on a petition to end the violence. The Peace People movement "helped to de-legitimize violence, increase solidarity across sectarian lines, and develop momentum for peace" (Lehman 2011). Corrigan and Williams were belatedly awarded the 1976 Nobel Peace Prize. In a 2006 interview, Corrigan stated, "Militarism . . . [does not] solve problems of injustice and inequality. We must sit down around the table and have a conversation" (Nobel Prize Organization 2016).

times should be acknowledged. These two women presidents, Mary Robinson and Mary McAlesse, represented the first instances of "activist presidency" (Galligan 2012, 596). Mary Robinson's presidency reflected her "humanist" concerns with rights and "moral and political conscience" (613). As a result, she concerned herself with attending to the forgotten voices and experiences in Ireland, such as women's groups, and that of the Irish diaspora (O'Hagan Hardy 2008, 48, 56). The motif of Mary McAlesse's two-term presidency, on the other hand, was that of "reconciliation" between Northern Ireland and the Republic of Ireland (Galligan 2012, 613).

Three main reasons are given to explain the low political participation of Irish women. First, the low number of female elected representatives can be attributed to the ideology of nationalism, which emerged in the early years of the Irish republic. Though women gained the franchise in 1928, there was a steady rolling back of women's rights at that time (Luddy 2005, 175). In 1927, the Juries Act made it difficult for women to sit on juries, and in 1929, the Censorship of Publications Bill prohibited the advertising of

contraception in Ireland. These acts, in addition to the aforementioned Marriage Bar, curtailed the public role of women (Luddy 2005, 175–176). In these ways, Irish women's involvement in the war for independence was quickly being forgotten, and a new model of Irish femininity was promoted in which the private role of motherhood was understood as women's ultimate calling. This patriarchal move culminated in the 1937 constitution, which would uphold a new definition of womanhood in Ireland, that of "the quiet, modest, self-sacrificing role" (Valuillis 1995; Inglis 2005, 20) of mother. This reconstruction of Irish femininity was in part due to the close allegiance between the fledgling state and the conservatism of the Catholic Church, but also to the patriarchal nature of nationalism itself (O'Hagan Hardy 2008, 49).

Second, others contend that the low level of female participation in political decision making can also be attributed to the nature of Irish politics. The Republic of Ireland is made up of two houses of Parliament: the lower house, called the Dáil, and the upper house, the Seanad. The electoral system is one based on a system of proportional

representation, or the single transferable vote. This means that when people are casting their votes, they may do so either because they support the individual or because they support the political party of the candidate. To get a majority in the Dáil (i.e., Irish Parliament), political parties need the support of nearly 50 percent of the electorate. In a race to appeal to the majority of voters, it has been claimed that Irish politics and elections tend to focus on securing the “popular vote,” that is, “promising the most to the widest possible range of beneficiaries” (Breen et al. 1990, 34). As a result, the Irish political system has been found to be “locally centred rather than focused on major national economic or social policy issues” (Breen et al. 1990, 21).

Success in Irish politics then depends on the personal and popular appeal of candidates or party manifestos. Key to ensuring this level of regard among the local community is a “community reputation for concern and activity” (Komito 1984, 177). As a result, politics in Ireland requires elected and prospective politicians to insinuate themselves into the daily life of their community and constituents. While the small Irish population is conducive to this personal aspect of Irish politics (for instance, Irish politicians often attend funerals, community events, etc.), it can take many years for individuals to build up such a profile in a community. Such an investment of time and energy can be argued to be easier for men to achieve than for women.

Third, some political scientists have observed how political parties can act as “gatekeepers” in keeping women out of politics (Galligan 1999; Finnegan and Wiles 2005, 374). In an attempt to counter this level of inequality, Ireland passed a legislative quotas bill in 2013. This bill saw all Irish political parties committing themselves to having 30 percent female representation by the next elections and up to 40 percent after seven years (European Commission 2013). Noncompliance to the Electoral (Amendment) (Political Funding) Act will result in financial penalty (Buckley 2013, 341) for the parties in question. In this way, Ireland is trying to rectify the gender inequalities that exist around leadership positions for women, not only in Ireland but also across Europe (European Commission 2013).

It is important to state that the low level of women in Irish politics does not mean that Irish women have no interest in public issues. Irish women have been good at organizing themselves at the local level and forming special interest groups. For instance, in 1942, the Irish Housewives Association (IHA) was founded with the initial purpose of calling a debate on the then rising price of food and fuel (Ferriter 2008, 181). Similarly, the Irish Countrywomen’s

Association (ICA) was established to lobby government for more services for rural Ireland, such as rural electrification and running water. By 1965, it had 20,000 members (181).

In the 1970s, the Irish women’s movement was established, and they immediately set themselves the task of interrogating the ban on artificial contraception (Inglis 2004, 28) as well as marriage breakdown, rape, and violence against women (Ferriter 2008, 187). In 1974, Women’s Aid was set up, offering refuge for abused wives in a four-bedroom house in Dublin. In its first year of operation, it housed 117 women (187). In a one-day survey of its service on November 6, 2013, Women’s Aid reported that 467 women and 229 children were accommodated or received support from its domestic violence service (Women’s Aid 2013). In 1979, the Dublin Rape Crisis Centre was founded in response to the gang rape of a 16-year-old girl who was left for dead by her attackers in a basement in Dublin (Ferriter 2008, 188). Through the work of this organization, the silence around sexual violence was addressed and lifted (188). In 1990, marital rape was criminalized (189).

Women also have a strong record in community work, both as community project volunteers as well as project leaders (Acheson and Harvey 2008, 127; the National Committee on Volunteering 2002, iii; CSO 2007; Neville 2012). In this way, it is argued by Coulter (1993, 59) that Irish women’s involvement with community groups is an example of women’s organizing and activism beyond the formal patriarchal structures.

Religious and Cultural Roles

Uniquely, the Irish Constitution explicitly defines women’s role in Ireland. Article 41 states the following:

41.2.1 In particular, the State recognises that by her life within the home, woman gives to the State a support without which the common good cannot be achieved.

41.2.2. The State shall, therefore, endeavour to ensure that mothers shall not be obliged by economic necessity to engage in labour to the neglect of their duties in the home.

With these articles, the Constitution offers a decidedly patriarchal, conservative, Catholic, and maternal construction of femininity (Hanafin 1997). It presents that the natural place for women is in the domestic sphere and offers motherhood as the main source of feminine identity.

However, the symbolic status of motherhood is restricted to a rather Catholic and conservative construction. As a result, motherhood, and female sexuality by implication, is seen as a product of marriage. In this respect, Irish female sexuality and motherhood became bound up with the Catholic values of “chastity, virginity, and modesty, as well as piety and sobriety” (Inglis 2005, 11).

By regulating female sexuality through marriage, two issues arose. First, issues around intimacy and sexuality were interpreted not as private issues but rather as issues for social debate and concern. The human body and notions of desire become subject to social scrutiny, leading to fears about the general morality of Irish society. To instate social control and order, repression and “self-denial” became the principal ways through which Irish society policed behavior (11). The impact that such a climate of repression had on Irish society, and especially family life, is well-documented (e.g., Humphreys 2006; Messenger 1969; Brody 1973; Inglis 2005, 10). In his analysis of the letters to Ireland’s most popular “agony aunt,” Angela Macnamara, from the 1960s to the 1980s, Ryan (2011) finds a disturbing portrait of Irish men being emotionally unavailable to their wives, and yet their wives feel obliged to allow sex whenever their husbands want it (225–226). In fact, they reveal the confliction that married women felt at that time: while they felt that sex was shameful, they were also tormented by the notion that it was a sin to refuse their husbands (226). It would also appear that this culture of repression and self-denial resulted in ignorance around sex and reproduction and apprehension about sex, even marital sex.

Hilliard’s (2003) interviews with a group of working-class women reflecting on their family lives in the early 1970s reveal the full and personal effects of living in such a climate of Catholic rules and regulations. The unavailability of contraception until 1979 (even then only permitted on prescription from a general practitioner) meant that all the women interviewed felt that they had no control over their sexuality. This fear of becoming pregnant became associated with a fear of sex itself. Nevertheless, the women also felt that a woman had to permit her husband to have sex whenever he wanted to (32). As a result, a powerlessness and shame complex emerged for the women, and sex was interpreted as something with which they did not associate pleasure. Further, they also recalled it as a time of great ignorance around contraception, sexuality, and reproduction for both men and women (34).

Under such a rigid definition of femininity, any women found to transgress or contravene this code would have

severe consequences meted out to them. There was a huge stigma associated with being unmarried and pregnant in Ireland for the most of the 20th century (Luddy 2011, 110). A woman who found herself pregnant and unwed had two options. She could either leave for England and give her baby up for adoption there, or she could stay in Ireland and spend her pregnancy in an institution specially designed to cater to unwed mothers. Single pregnant women, either voluntarily or forcibly, were brought to these houses by their families. Once their babies were born and adopted, the women could go back and rejoin “respectable” society (Luddy 2011, 118, 120). Those who had more than one child out of wedlock were from the lower classes and could find themselves in other institutions (O’Sullivan and O’Donnell 2007, 33, 39).

Magdalen Homes were funded and run by female Catholic religious congregations. During the 1950s, thousands of women were housed there (37). Much has been written about the experiences of women who went to Magdalen Homes at this time. The 2002 film *The Magdalene Sisters*, directed by Peter Mullan, offers a fictionalized account of the lives of three young women who stayed in one Magdalen Home in the 1950s. It is now well-documented and acknowledged that for the women held in Magdalen Homes, “Life within these institutions was restricted and restrictive. . . . Their daily life was made up of prayer, labour, recreation, and silence” (O’Sullivan and O’Donnell 2007, 38). By the mid-1970s, the numbers of women sent to these homes had steadily dropped, as the taboo about illegitimacy gradually subsided, and by the mid-1990s, they were all closed (38).

Historically, women in Ireland have had little personal control over their reproduction, with artificial contraception being banned until 1979 and the sale of condoms regulated until 1993. It was not until the Family Planning Bill (1979) that contraception became available, but only to married couples and with a doctor’s prescription (Ferri-ter 2008, 191). In 1978, the country’s first family planning clinics were opened in Dublin. In that year alone, 25,000 patients availed of its services (191). Contraception was very much connected with the Catholic doctrine of procreation. To convey how observant the Irish people were to Catholicism, in 1973–1974, weekly attendance at church was at 91 percent, and 69 percent of Irish people believed in papal infallibility (Ryan 2010, 326). In 1983, the ban on abortion was written into the Irish Constitution. In what was an incredibly divisive campaign by pro-life and pro-choice campaigners, the amendment was passed by a

two-thirds majority (Ferriter 2008, 194). According to the Eighth Amendment to the Irish Constitution, “The state acknowledges the right to life of the unborn and, with due regard to the equal right to life of the mother, guarantees in its laws to respect, and, as far as practicable, by its laws to defend and vindicate that right” (Gilmartin and White 2011, 276).

This amendment was tested in 1992 with the X case. The X case emerged when a 14-year-old girl was prevented from traveling to the United Kingdom to terminate her pregnancy. Although the pregnancy was the result of a sexual assault and she had the support of her parents for a termination, the state intervened and refused her permission to leave the country. Irish women have been traveling to the United Kingdom for abortions since the U.K. Abortion Act 1967 allowed women to travel from abroad for the purpose of securing an abortion (Rossiter 2013). While the teenager in the X case inevitably suffered a miscarriage, the Supreme Court overturned the state’s objection to her traveling abroad. Since then, the right to travel to obtain an abortion has become part of the amendment (Gilmartin and White 2011, 277). The subsequent referendum on abortion in 1993 also allowed for informational access to abortion services in the United Kingdom as well as acknowledging that the threat of suicide was grounds for permitting abortion in Ireland.

The number of women traveling to the United Kingdom to procure an abortion has been falling since the 2000s; nevertheless, 45,645 women who provided a home address in the Republic of Ireland visited an abortion clinic in the United Kingdom between 2001 and 2008 (Gilmartin and White, 2011, 276). While Irish women are allowed to travel abroad for an abortion, no support or counseling is available to them in Ireland (Gilmartin and White 2011, 277). Nevertheless, the decision to go abroad for an abortion brings with it “unnecessary risk, stigma, shame and anguish” (279).

Attendance at the Catholic Church had fallen to 43 percent as of 2008 (Nic Ghiolla Phadraig 2009, 3). Sexual norms and mores are also changing. For instance, in 1994, 49 percent of Irish people thought that premarital sex was wrong, but by 2008, this fell to 23 percent. In 2008, 60 percent said that it was not wrong to have sex before marriage, whereas only 35 percent of people said so in 1991 (2). Attitudes toward contraception and abortion have also changed. Sixty-five percent of married women in Ireland use some form of contraception (WEF 2013, 220). In 1973, 74 percent of the Irish public were against abortion (Phadraig 2009, 2).

In 2008, only 51 percent agreed that abortion was always wrong when a defect is found in the baby (2).

This sense of social change seemingly coincides with a sense of continuity regarding gender roles in Irish society. O’Sullivan (2012) examined survey data from the International Social Survey Program, which was carried out in Ireland in 1998, 1994, and 2002. Overall, she found that Irish society is generally favorable to the labor participation of women, a trend posited by others (e.g., Craven 2004; Fine-Davis 1988; Hilliard 2006; O’Sullivan 2012, 225). However, she also found that people’s opinions on whether a woman should work were influenced by whether the woman had children and the age of her children. In 1988, survey data found that 52.4 percent agreed that women with preschool-aged children should stay at home. This fell to 33.1 percent in 2002. In 1988, 8.9 percent felt that women should be able to continue working full-time with preschool-aged children; this only rose to 9.0 percent in 2002. Support for women to work full-time with school-aged children remained relatively stable from 1998 to 2002, with 21.2 percent in 1998 agreeing with the statement and 22.0 percent in 2002.

The option of part-time work appeared to be more favorable to the survey respondents. In 1998, 49.3 percent supported the idea that women with school-aged children should work part-time; this fell to 45.2 percent in 1994, but it rose again to 53.8 percent in 2002 (O’Sullivan 2012, 229). When women had no children or their children were no longer living with them, the consensus was that women should work full-time (229). This attitudinal survey was administered again in 2013 (223), but its results have yet to be published. Despite this gap in recent attitudinal data, based on the previous survey findings, it is fair to assert that while Irish society is positively inclined toward the idea of women in employment, the Irish public still see a woman’s role as a caring, domestic, and maternal one.

Issues

Reproduction Rights

In October 2012, the issue of abortion in Ireland reemerged because of the death of Savita Halappanavar. Halappanavar was 17 weeks pregnant when she presented to University Hospital Galway with bleeding. When she was informed that she was miscarrying, she requested an abortion but was refused because of the blanket ban on abortions—medical or elective. She subsequently

underwent a protracted miscarriage and developed an infection. She died of sepsis a week later. Her death caused public controversy, with many women organizing local and national protests on the unavailability of medical abortions in Ireland as well as the apparent prioritizing of the life of the unborn at the expense of the mother's.

On June 12, 2013, the Draft Protection of Life during Pregnancy Bill was published. It still upholds Ireland's general prohibition on abortion, but it outlines how doctors should assess whether a mother's life and not her health is at risk. A gynecologist and a second expert must agree that a termination is in the best interest of the mother. If the risk to life is due to suicide, then three experts must deliberate over the case, one obstetrician or gynecologist and two psychiatrists. They all must be in agreement that terminating the pregnancy will save the life of the mother. Anyone assisting in an unlawful termination is subject to a 14-year prison sentence (Rossiter 2013). The draft bill was signed into law in July 2013. However, since Ireland voted for marriage equality in May 2015 there has been a feminist grassroots movement called "Repeal the 8th Amendment" lobbying for a change in Irish abortion legislation (Repeal the 8th 2017).

Child Care

Despite the growing number of women participating in the workplace, Ireland has had, until recently, a poor record in the area of early child care services and provision. Ireland has adopted a low public investment, mixed market model regarding child care (Bennett 2005). Such an approach to child care is also found in the United States, Canada, and South Korea. With this approach, the government takes the view that child care is the responsibility of parents and families, and not that of the Irish state. As a result, the issue of child care has evolved into a private concern, primarily of working mothers.

The minimal level of involvement shown by the Irish state is reflected in the low level of national early child care policies in Ireland as well as regulation of the sector. In 2009, one concession was made by the government wherein they offered one year of free preschool education to Irish children (WEF 2013, 220). Throughout the Celtic Tiger economy, Irish parents were found to have the highest cost of child care in Europe, and they spent more of their income on child care than elsewhere in Europe (Allen 2009, 27). In 2008, Irish working parents spent more than 30 percent of their income on child care (OECD 2013a).

Even with rising unemployment levels, child care remains a huge financial burden.

Italy

Overview of Country

Italy is a boot-shaped peninsula stretching down into the central Mediterranean, with two large islands and 4,583 miles of coastline. On January 1, 2016, almost 60.7 million inhabitants lived in Italy's roughly 116,631 square miles. The north of the country is crowned by the Alpine chain, along which runs the border with France, Switzerland, Austria, and Slovenia. At the toe of the boot, the island of Sicily extends far enough into the Mediterranean as to leave only 87 miles between its southernmost point and Cape Bon, Tunisia, in North Africa.

Italy is one of the most densely populated countries in the world. It is also one of the grayest countries, with 258 elderly residents (older than 65 years) for every 100 minors (younger than 14 years). Fertility reached record low levels in the mid-1990s, and the average is currently below 1.5 children per woman. Another reason for the aging population is long life expectancy, which in Italy is nearly 80 years for men and up to 85 years for women. According to the Italian National Institute of Statistics (ISTAT) Web site, the Italian population is forecast to decline after 2040, when increases from migration and further improvements in life expectancy will no longer be able to compensate for below replacement-level fertility rates.

Of the nearly 61 million inhabitants, roughly 5 million are regular "foreigners" with a slight majority of women. Immigration on a relatively large scale is a recent development for Italy, as the country "exported" significant portions of its population until the early 1980s (Bonifazi et al. 2009). The first significant inflows date to the 1990s, the aftermath of the fall of the Berlin Wall and the collapse of formerly planned economies. Some of the largest initial flows were women from Eastern European countries who would eventually find work in the household sector as caregivers or housekeepers (Bettio, Simonazzi, and Villa 2006).

The largest minority groups in Italy originate from other European countries, Romania in particular, followed by Morocco, Albania, China, Ukraine, and the Philippines.

Compared with other European countries, the number of migrants in Italy is modest, but immigrants are highly visible in the media, chiefly due to the stir over “boat people,” migrants who are loaded aboard precarious vessels by smugglers and sent toward Sicily from the North African coast. Despite the high risk of drowning before reaching their destination, a record number of people made the dangerous journey to Italy across the Mediterranean in 2016. From January 1 to November 6, there were at least 163,989 migrant arrivals to Italy by sea, and at least 3,755 people died attempting the crossing (International Organization for Migration 2016).

Rome, the current political capital of Italy, was once the capital of the Roman Empire, which at its peak in the 2nd century CE reached from what is now England in the north to Egypt in the south, and from Portugal in the west to Russia in the east (Ruffolo 2004). Some thousand years after the fall of the Roman Empire, in the 15th and 16th centuries CE, the city of Florence rose to prominence throughout Europe as the cradle of the Renaissance. With the advent of the industrial revolution, Italy lost ground to other European countries and began catching up again only after the Second World War was over and 30 years of Fascism came to an end. However, some of the legacy of its artistically rich and often sumptuous past filtered through to the postwar period when the country was again to become known worldwide thanks to the fashion industry. The lavish lifestyles of local nobility over the past five centuries have also nourished a regionally diverse cuisine that now ranks alongside fashion for international reputation. A rich historical heritage also bequeathed a huge artistic and architectural inheritance that continues to attract tourists from all over the world. Italy is home to 50 UNESCO World Heritage Sites, the largest number held by a single country in the world.

Given this long history of cultural achievement, it is hardly surprising that Italy belongs to the group of very high human development nations. It is ranked 27th out of 188 countries according to the United Nations Development Programme’s (UNDP) 2014 Human Development Index (HDI), having increased its HDI nearly 21 percent between 1980 and 2014. The average income per capita is somewhat lower than in other high human development countries, but Italy has the third-highest life expectancy in the world. According to the Organization for Economic Co-Operation and Development (OECD), a reasonably effective public health care system has contributed to keeping Italians healthy (OECD 2015).

Italy is ranked 10th out of 155 countries on the 2014 Gender Inequality Index (GII). In the algebra of the index, the disadvantage of having one of the lowest female labor market participation rates in Europe is counterbalanced by the advantage of very few adolescent births. Somewhat paradoxically, these two factors stem in part from a common root: a cohesive family structure. The abortion rate in Italy (6.6 per 1000 in 2015) is among the lowest globally; however, over two-thirds of gynecologists avail themselves of the right to conscientiously object to provide abortions. The debate accompanying the introduction of women’s quota on company boards convinced some parties to adopt more or less informal quotas in the 2013 parliamentary elections. As a result, women’s share of parliamentary seats jumped to 30 percent, further improving the country’s ranking on the GII. This recent development, however, may not outlast the reform of Parliament and of the electoral law that is currently being debated.

Other gender equality indexes are less favorable to Italy, starting with the sophisticated European Institute for Gender Equality (EIGE) index, which ranked Italy fourth from the bottom in the EU27 group of countries around 2010 (EIGE 2013). Such discordant measurements are revealing of the uneven status of gender equality in the country.

Girls and Teens

Habits and Lifestyles

Compared to boys, Italian girls report being more discouraged about job prospects after completing their studies. They also engage in fewer sports and, unlike male peers who often continue to dream of being “footballers,” they focus on more concrete aspirations and no longer fantasize about becoming “ballet dancers.” Girls who frequent on-line social networks, where what matters is how many “likes” one scores on message boards or how one gains top popularity, report insecurity and dissatisfaction with their physical appearance. These girls would like to be leaner, have larger breasts, different legs and, in general, “be more beautiful.”

Bullying and Cyberbullying

Lately, violence against girls has been changing shape, becoming increasingly subtle and increasingly invasive of privacy and damaging to intimacy. The Internet and social media have become catalysts of psychological violence,

which especially targets (young) women. Occasionally Web-based violence leads to suicide, as in the case of Carolina Picchio, who died at 14 years old, the first known case of cyberbullying in Italy. More generally, this type of violence leads to a whole range of psychosomatic problems, from eating disorders to self-injury. According to data released by the National Observatory on Adolescence in 2016, girls make up 70 percent of the victims of cyberbullying and 52 percent of the victims of revenge porn. Widespread among girls is the experience of being verbally abused, and they are more often targeted because of the way they look or behave, including in intimacy.

The first law on cyberbullying in Italy was introduced in May 2017. One notable provision in the law is the possibility for the young victim, even without the parents' knowledge, to ask directly the owner of the Web site to obscure or remove the instance of "cyber aggression." If the owner ignores the alarm, within 40 hours the victim, this time together with the informed parents, will be able to contact the national Data Protection Authority (*Garante della Privacy*). Moreover, a teacher trained in digital citizenship will operate in each school, with the help of the police whenever needed.

Health

Access to Health Care

The *Servizio Sanitario Nazionale* (SSN), the Italian equivalent of a national health service, was set up in 1978 to ensure universal access to health care funded by taxation. The funding is channeled to regional governments that produce and deliver the services. Central coordination is ensured by specifying basic health service standards (*livelli essenziali di assistenza*), which identify the set of services to be guaranteed in all areas of intervention. In 2015, a little more than 80 percent of total health expenditure in the country was public, corresponding to USD\$2,029 per capita (ISTAT 2016). This amount financed, among other services, one family doctor for each 1,160 inhabitants and one family pediatrician for each 890 children under 14 years old.

With a life expectancy of 85 years, the fifth highest in the world—Italian women clearly benefited from the national health care systems, although fiscal pressures are forcing cuts to services and fee raises that may endanger past achievements. At the same time gender differences have attracted selective rather than systematic attention, particularly in reproductive health and hardly anywhere

else. For example, there is no gender sensitive approach to health care for an aging population, despite the disproportionate incidence of older women, and gender medicine is still in its infancy. Only recently has the think-tank and monitoring arm of the Health Ministry (the *Istituto Superiore di Sanità*) set up and financed a dedicated clinical research network to investigate gender differences in health and medicine under a four-year strategic project for women's health (*Progetto Strategico Salute Donna*). However, there is little evidence that the project has had any significant impact on health guidelines and service standards. Lack of relevant, gender-disaggregated statistics stands in the way of effective implementation of a gender health and medicine approach.

Maternal Health

In the mid-1970s, the Family Counselling Services (*Consultori Familiari*) legislation was introduced to promote clinical and psychological support to maternity and paternity, to offer counseling with regard to contraception, to protect women's and children's health and to offer information on infertility and sterility. However, legal provisions were never implemented in full. The holistic, interdisciplinary approach of the Family Counselling Services is believed to be in conflict with the organization of the rest of the SSN which pivots on medical specialties. Also, the Family Counselling Services faced the opposition of the Catholic Church, which feared that they would actively promote abortion. Maternal health has thus gone down a medicalization path, with mixed results. On the one hand, mortality has declined dramatically for mother and child: infant and maternal mortality have gone down to 2.9 and 2.6 deaths for every 1,000 live births in 2012. On the other hand, there is high prevalence of caesarean sections, 368 per 1,000 deliveries in the same year (OECD 2015). In response to mounting public concern over caesarean sections, the Health Ministry is trying to revitalize the network of Family Counseling Services to promote natural childbirth.

About four-fifths of mothers breastfeed in Italy. While prevalence of breastfeeding has been relatively stable in recent years, the breastfeeding spell has lengthened from about six months in the late 1990s to about seven months in the mid-2000s (ISTAT 2015). Like elsewhere in the United States or in Europe public opinion is moving in favor of longer breastfeeding and at children's will rather than at regular intervals. However, there is no clear consensus on this point and the debate is still open. Most

specialists agree that breastfeeding is less important to a child's development after the first six to seven months.

In a societal context of low fertility, family cohesiveness, and catholic ethic children's health has traditionally been a priority concern for both families and policy makers. As a result even sophisticated neonatal care is generally accessible. If anything, the Italian medical profession has started questioning those neonatal treatments that may border on *accanimento terapeutico* (aggressive treatment of dubious efficacy).

Assisted Reproductive Technology (ART)

Over the past decades, young Italian women have consistently postponed giving birth until later in reproductive life. With one-third of all women currently giving birth after their 35th birthday, access to assistive reproductive technology (ART) is not a minority issue. Before 2004, ART was not regulated. A draft law was actually presented to the Parliament much earlier, in 1998, but issues concerning reproduction are politically divisive in the country; some compromise was reached only six years later (Zanini 2011). Law 40/2004 is considered very restrictive. It has swollen the number of couples seeking ART in health clinics of more permissive countries, and it has been repeatedly challenged by lower courts chiefly on the grounds that it is harmful to women's health (Normattiva.it 2004). Court cases and, finally, a constitutional court ruling have radically altered the law, for example, by removing previous restrictions to the number of embryos to be created and allowing flexibility as to the time of embryos' transfer to the woman's womb.

Disorders

Traditional attention to women's reproductive health has also favored mass screening to prevent two of the most frequent cancers among women, breast and cervical cancer. Roughly 1.25 million of Italian women were diagnosed with cancer in 2014, the overall risk of cancer being slightly higher in the female population. Breast cancer alone accounted for more than 500,000 cases, followed by colon, womb, thyroid, and cervical cancer. On the bright side, the survival rate for breast cancer for women five years after first diagnosis is high, second only to skin cancer, at about 80 percent (AIOM et al. 2014).

In comparison to cancer, fewer resources have been devoted to date to chronic diseases that disproportionately affect women in old age, including depression (17% of

elderly women suffer from it) and dementia (ISTAT 2013), but attention is growing.

While fighting against cancer is given top priority, smoking, alcohol abuse, and even sexually transmitted diseases raise fewer concerns, although women have become more exposed over time in comparison to men. The main reason is overall low or decreasing prevalence. Take HIV and nicotine addiction to smoking for example. Among individuals with sexually transmitted diseases in 2012, about 8 percent of men tested positive for HIV and a little more than 2 percent of women. In regard to smoking, only one out of six women smokes and the share of regular, daily smoking is rapidly decreasing fast among younger women and men (Istituto Superiore di Sanità 2014; ISTAT 2013).

Education

As in many other countries, Italian women are overtaking men in education in both numbers and levels of achievement. However, this does not mean that they are more highly educated than women in countries of similar levels of development or that all gender gaps have reversed in their favor.

Women's educational attainments in Italy must be placed in context. The country's education spending is less than the average among Organization for Economic Cooperation and Development (OECD) nations and shows slightly lower levels of achievements. In 2013, about 11 percent of the GDP was spent in education (public or private), five points less than the OECD average. Education is public, although the incidence of private educational concerns is significant at both ends of the spectrum: preprimary education and university-level education. Funding is, again, largely public, but private funds—chiefly from households—account for over one-third of total spending on tertiary education, much less on primary and secondary education. Formal vocational training (as opposed to formal education) has never really gained ground in the country.

The educational career comprises six levels, from preprimary schooling to postgraduate studies. Schooling is compulsory until 16 years; that is, after completing lower secondary education and receiving some vocational or upper secondary education. A "regular" Italian student is expected to enter schooling between two and three years of age, earn a diploma when she is 18 or 19, and earn a bachelor's degree (*Laurea*) at 22 years if she decides to enter university education. The equivalent of a two-year master's

degree course (*Laurea Specialistica*) is an increasingly popular choice, while fewer go on to earn their doctorates.

While teaching is normally done in Italian, foreign language schools are increasing at all levels, as are university courses taught in English. Currently, however, young Italians with a lower secondary education have the highest chances of studying or learning a foreign language if they compete for an Erasmus scholarship to be spent in a different European country. At 52 percent of the total, young women are well-represented among students on Erasmus scholarships. Since Erasmus scholarships are awarded for high academic performance, the preponderance of young women is consistent with the fact that they tend to outperform young men in tertiary education.

Performance-based gender differences are hardly noticeable in early schooling. The enrollment and completion rate for young girls and boys are very high at preprimary and primary schools (95% for boys aged between 3 and 10 years old in 2015 and 94% for girls). Both levels of schooling are believed to be of comparatively good standards in Italy. Differences become noticeable in upper secondary and tertiary education, where girls surpassed boys in rates of both enrollment and completion in the late 1980s. In comparison to other rich countries, however, enrollment rates at the university level are low (around 30% among the 20-to-24 year olds); yet, again, young women have been doing better than young men since the early 1990s.

Although there is no formal system of quality ranking of public educational concerns in Italy, an informal ranking does exist. Thus, students often commute daily from smaller to bigger towns if they wish to attend “better” schools. Universities trigger huge migration flows of students from southern to central and northern regions as well as within regions. This geographical mobility is an added cost for families, but it has an important advantage, especially for young women. It legitimizes leaving the family nest and allows them to first experience independent living.

As in many other countries, higher educational achievements for women do not imply that they excel in all fields. The traditional gender divides of women’s better performance in reading and weaker performance in mathematics also holds for Italy. So does the division between the feminized Arts disciplines and the male-dominated hard sciences and engineering. In fact, traditional gender stereotypes influence young women’s choice of field of study in Italy, as in most other rich countries. Most people agree

that the best time and place to combat such stereotypes is preprimary and primary schools. However, actual implementation often provokes opposition. An example is the textbook *Acero Rosso*, which was accused of spreading the “ideology of gender” and subsequently removed from the syllabus of the schools that adopted it. Allegedly, the book spread the view that having two fathers or two mothers following divorce and re-marriage is part of modern life. Critics strongly opposed this view and argued that such “gender theory” ends up legitimizing transgender and homosexual choices.

Although things are changing, some find that the pace of change is slow or uneven. For example, female students are becoming the majority in such traditionally male dominated disciplines as law, medicine, and even mathematics. A “public sector” effect may be at work here, as the state is the largest employer of doctors and law graduates to this date. Public sector jobs are coveted by young women because they often facilitate a better work-life balance than many private sector jobs by offering shorter or more flexible hours, longer parental leaves, higher tolerance for absenteeism, and more discretionary career paths. By contrast, the share of young Italian women choosing to study engineering has been growing slowly even over the recent decades, despite the fact that engineers still have better chances of finding a job than other graduates.

Employment

Labor Market Participation

Compared to their Northern or Eastern European counterparts, Italian women take less part in the labor market. Their behavior is more similar to that of women from other Southern European countries (Spain, Malta, and Greece in particular). For every 100 women of working age (14 to 65 years), fewer than 47 were employed in 2015, and an additional 13 were seeking work (i.e., unemployed). However, average labor market figures for Italy tend to obscure the considerable regional differences. The north-south divide that characterizes most aspects of the economic and cultural life in Italy is especially prominent in women’s work, with women from the “Mezzogiorno” (southern regions and the islands) much less likely to work and more likely to end up in unemployment. Differences are marked also between well-educated and poorly educated women. The former women are far likely to work and to avoid long interruptions to care for children or relatives. Poorly educated women are far less likely to be employed, especially in

the Mezzogiorno. This difference between well- and poorly educated women is to be found in most countries across the world; but what distinguishes Italy and other Southern European countries from the rest of Europe is that poorly educated women are far less likely to return to the labor force after marriage or childbearing (Eurostat 2016).

Maternity, Employment, and Discrimination

For every 100 Italian mothers in employment, about 30 stop working, often motivated by the necessity or desire to care for children or other relatives. Of these, only about 12 go back to work at some point, much less in the south of Italy. Not infrequently, however, the decision to stop working is forced on women. A special survey conducted in 2008–2010 revealed that nearly 9 percent of mothers who had worked at some point in their lives had been forced by employers to “voluntarily” quit upon becoming pregnant (Sabbadini 2012). Italian law forbids dismissals of pregnant women, but employers typically circumvented the law by asking young women to sign an undated resignation letter the moment they were hired (so called *dimissioni in bianco*). A legal remedy has been implemented, but, in the absence of any monitoring, we cannot know how effective it really is.

Wages and Earnings

For every hour worked, the average Italian woman earned 6 percent less than the average Italian men in 2014. This is the smallest percentage difference within Europe and a very small gap worldwide. The fact that, in comparison to men, Italian women earn comparatively more than elsewhere on an hourly basis, and yet are employed less than elsewhere, may sound puzzling. One key to the puzzle is that the average working woman is better educated than the average working man, precisely because fewer but better-educated women work in Italy than, say, in northern European countries.

If, however, we look at gross monthly earnings, Italian women earned, on average, the equivalent of \$2,412 USD in 2014, men the equivalent of \$3,101 USD. In percentage terms, the gender differential rises to 22 percent on a monthly basis, because women work fewer hours while earning less per hour (Eurostat 2017).

Female Migrant Workers

Italy is quickly becoming a country of immigrants, but unlike high-immigration countries of the past—including

the USA—the first large-scale inflows were largely feminized. With the collapse of the Soviet Union in the early nineties, female migrants from the East found employment in Italy (and other European countries, mostly Southern European) as elder carers, child carers or simply house workers (Bettio, Simonazzi, and Villa 2006). While care work and housework continue to pull female migrants from within and outside Europe (chiefly Latin America and the Philippines), other sectors also attract female migrants, chiefly low-pay sectors like catering, tourism, cleaning services, and retailing. At the same time, and as a consequence of the crisis, Italian College graduates—both young women and young men—as well as qualified researchers, find it difficult to get jobs that match their qualifications, and they tend to emigrate to Europe or worldwide. Via female migration, Italy thus takes an active part in the “care draining” of poorer countries while suffering from brain draining to the advantage of countries less severely hit by the economic crisis. However, the brain-drain phenomenon mainly concerns graduates and may be temporary.

Family Life

Fertility and the Character of the Italian Family

Fertility is very low in Italy despite the fact that about half of the women of working age are not active in the labor market. In 2015, the mean number of children per woman of reproductive age was 1.35. It is well-known that two children per woman are needed to keep the population from declining and aging. Given that the mean age of children per woman has stayed well below the two-per-woman threshold for over 30 years, the local population is aging quickly in the country. For every woman between the ages of 45 and 64, there are about 0.4 people over 80, a ratio that is expected to grow over in time (Accorinti and Pugliese 2015). However, the total population is not yet declining thanks to the increasing inflows of migrants.

The fact that Italian women tend to participate less in the labor market and yet bear few children warrants an explanation. It has been argued that, paradoxically, this is due to the nature and the role of the family (Bettio and Villa 1998). The Italian family still retains a key role as a productive unit because a large percentage of firms in Italy are still family-type firms. The family retains a key role as a welfare institution because income is still transferred within and across the generations to ensure continuity in the living standard of its members, whether they are

children who need to buy a house or elderly parents on a low pension. Moreover, publicly subsidized care of children, the elderly or the disabled, is scarce, and buying such care on the market is often very costly. Care of dependents is perhaps the most prominent aspect of family assistance. However, the Italian family is a flexible provider of many different forms of help to friends and noncohabiting relatives—financial assistance and care services, but also keeping company, doing housework, assisting with bureaucracy, etc. An earlier estimate of instances of help of any kind given by families to other families in one month placed them at 8 million for the whole of the country, involving 23 percent of families as givers and 19 percent as receivers (Sabbadini 1994). This compared to 15 million instances of medical care, 8 million medical examinations, and only 500,000 instances of home assistance provided by the state or private institutions.

Last but not least, the Italian family has responded to secularization by combining traditional values of solidarity with modern values of individual emancipation. For example, adolescent children are not encouraged to leave the parental nest early or to become independent, financially or otherwise (Aassve et al. 2002). Throughout Italy, the average age of leaving home has gradually increased to 30 years old in 2014 (29 for girls). Yet, within the parental household, children enjoy substantial freedom after adolescence, including privacy with sexual partners.

In such a cohesive family context, raising children is labor intensive and costly, especially for women who still provide the bulk of unpaid household and unpaid care. Some women give up having children altogether—and they are increasing in number—while others prefer to “invest” in few children, doting on them and making sure that they are well-cared and well-provided for into adulthood.

How Couples Allocate Time and Roles

Housework, including care work, is still largely the women's province. It occupies them for three hours per day compared to the 57 minutes of their partners. Some rebalancing is under way, but at a slow pace and mostly between young, more educated partners. Gender disparities in housework peak between 25 to 64 years of age, and they are not fully compensated by the fact that men tend to work more hours and travel longer distances to go to work. As a result, women have less time for themselves: 50 minutes a day less than men (ISTAT 2016). What is currently

changing at an appreciable pace is the way child care is shared among young partners, although change is uneven across tasks. Mothers are still primarily involved in the physical care and in the surveillance of their children—to feed, dress, sleep, or keep them under control. By contrast, fathers spend more time playing with them.

Politics Suffrage

During the Second World War, Italian women mobilized for the right to vote. Some were directly involved in armed resistance, many others in civil resistance. A Pro Voting Committee was among women's organizations set up during this period. On February 1, 1945, when Italy was still partly occupied by the Nazis in the north and by the Anglo-Americans in the south, the government presided over by Ivanoe Bonomi decided to pass legislation granting women the right to vote. Italian women voted for the first time on March 10, 1946, with a massive turnout at the polls. On that occasion, about 2,000 candidates won a seat in the newly elected municipal councils. Two months later, on June 2, 1946, the population was called to choose between the monarchy and the republic, and to vote the representatives at the Constituent Assembly (*Assemblea Costituente*) that would discuss the new Italian Constitution. In this election, 21 women were elected to the Assembly.

Women's Rights

Italian women can avail themselves of a large body of legal provisions enforcing their rights and ensuring full citizenship, despite remaining gaps. The feminist movement, the trade union movement, and pressure from Europe take a significant share of the credit in this respect. As in other areas of the economic and social life, however, the problem is not lack of good legislation but uneven enforcement.

Concerning employment and wages, key legislation was enacted between the late '70s and the early '90s (Law 903/77 and Law 125/91). More recently the National Code of Equal Opportunities between Women and Men (D.L. 198/2006) consolidated previous legal provisions under a consistent set of legal norms (Rosselli 2014). Direct and indirect discrimination in any aspect of employment, training or pay, are ruled out by the existing body of laws, including unequal pay for work of comparable value. Existing equal opportunity legislation also envisages policies pursuing *de facto* rather than formal equality. In the past

it also contributed to designing an institutional machinery presiding over and monitoring actual enforcement of equality legislation. A notable example is the creation in 1991 of Equality Advisors (Consigliere di Parità) operating in every province and region with the main task of dealing with cases of employment discrimination. At the top of the equality machinery stands a Ministry of Equal Opportunity (*Ministero delle Pari Opportunità*) that was set up in the Prime Minister's Office in 1997. However, the scope for action was, and remains, severely limited by the fact that the ministry was never assigned an independent budget. The economic crisis further reduced funding for the entire equality machinery, with the result of marginalizing it conclusively.

Concerning rights within marriage, divorce was legally introduced in 1970 (Law 898/70), and in a referendum to repeal it in 1974, pro-divorce organizations won nearly 60 percent of the votes. This victory paved the way to a radical reform of family law starting in 1975 and culminating in 2013 with Law 219. More recent, procedures for separation and divorce have been further simplified and sped up by Law 107/2015, nicknamed the “quick divorce law” (*divorzio breve*).

Divorced spouses have the right to alimony ensuring a standard of living comparable to that enjoyed during marriage. The protection that this grants married women has, however, been lessened by a recent court ruling declaring that spouses have the right to alimony ensuring a “decent” standard of living.

Reproductive rights pivots on the abortion law (Law 194/78) that was enacted in 1978. The law was challenged by means of a referendum and eventually confirmed. As noted above, actual implementation of the law is made difficult by the right to conscientious objection. Assisted reproduction was first regulated in 2004 (Law 40/2004), but it remains rather restrictive.

Recent years have witnessed legal innovation mainly in the area of violence against women, where Italian legislation has truly lagged behind. So called “honor crimes” (allowing male relatives to harm or kill a woman guilty of adultery) remained legal in Italy until 1981, when legislation on honor crimes was repealed. Rape ceased to be classified as a crime against public morality and not against an individual person only in 1996 (Law 66/1996) and not until 2009 did stalking become the object of a specific law (Law 38/2009). In fact, the said Ministry for Equal Opportunities approved the first National Plan Against Gender-Based Violence and Stalking as late as 28 October

2010. As in other areas, the main problem with legislation against gender-based violence is implementation of the law. In this case, there are issues of adequate training of the police force and inadequate funds for support centers and shelters for the victims of violence.

Political Participation

By international standards, Italy currently fares well regarding the presence of women in decision making positions. However, this is a rather recent development, and much remains to be done. Women's representation remains modest or very modest in public institutions and private companies alike. Law No 120/2011 was the first significant attempt to redress the imbalance in representation. It imposed gender quotas (men can benefit too if they are in a minority!) for the boards of public companies. Thanks to the law, the percentage of women sitting on the boards of Italian public companies jumped from about 6 percent in 2011 to the current 30 percent (Ferrari et al. 2016).

Electoral rules for local governments have also been amended to ensure a significant presence of women. Law 215/2012 rules out single-sex local government teams. Moreover, thanks to informal quota rules adopted by some of the most important political parties, women reached the record share of 30 percent in the last Parliament elections—the highest share in the history of the Italian Republic. However, instances where women sit at the very top of companies or organizations are still uncommon, and it the rule of thumb, that the larger the budget the thinner the presence of women in charge, remains hard to disprove. In national or regional governments, for example, female representatives, including ministers, mostly deal with family, health care, welfare or education while they seldom preside over financial or other prestigious positions.

Religion

Religion still plays an important part in the political, economic, and social life of the country. The Vatican—an independent town-state within the city of Rome—is home to the institutions governing the Catholic Church worldwide and hosts its spiritual leader, the Pope. Roughly two thirds of Italian citizens (about forty million people) declare themselves Roman Catholic, although only a quarter of them are churchgoers. Each of the two largest minority religions—Christian Orthodox and Muslims—is currently below 2 million followers in size.

Younger women and men are the least religious, and equally so (Matteo 2012). Yet, Catholic principles and beliefs still influence welfare provisions, civil liberties and even scientific research. For example, euthanasia is still not regulated by law although many surveys find that the majority of Italian citizens approve of the idea. Also, the rights and duties of co-habiting partners (as opposed to husband and wife) were first regulated by law as late as 2016. Court cases sometimes compensate for legal voids in civil rights, but their coverage is inevitably patchy. Against this background the LGBT community—both men and women—may find it difficult to garner support for their demands, although a host of organizations voice their requests and organize support. Some scholars argue that Catholic religion hindered women's employment (Pastore and Tenaglia 2013). While this may be disputed, it is hard to deny that the Catholic institutions favored social and economic policy in support of the traditional patriarchal family and opposed devolving the role of the family as the main supplementary welfare institution to the state.

Issues

LGBT Rights

According to the 2017 annual report of the European Fundamental Rights Agency, Italy is among the countries to have taken steps to advance LGBT equality over recent years, although actual implementation may not yet match the legislation. Legislation allowing for same-sex marriages came into force in Italy in June 2016 with the Regulation of Partnerships and of Civil Unions between Persons of the Same Sex (*Regolamentazione delle unioni civili tra persone dello stesso sesso e disciplina delle convivenze*). The law was passed following months of social and political debate and numerous demonstrations both for and against it. The text of the law does not explicitly allow for step-child adoption, but court rulings provide precedent for such adoption in Italy. The first ruling was issued by the Rome Juvenile Court (*Tribunale per i minorenni di Roma*), which in July 2014 legally recognized a woman's adoption of the biological daughter of her partner.

Legal advances notwithstanding, the perception of discrimination on the basis of sexual orientation in Italy is high, according to 73 percent of the respondents to the last report of Eurobarometro. Bias is especially perceived in the labor market: 61.3 percent of respondents believe that gays

and lesbians had fewer opportunities to find a job or to obtain a job promotion than heterosexuals. Although the majority of Italians—especially the female population—consider workplace discrimination on the basis of sexual orientation unacceptable, transgender discrimination is seen as more tolerable. The National Office against Racial Discriminations (UNAR) has supported initiatives for LGBT labor inclusion—including career days and a web platform specifically aimed at matching people with job opportunities—by involving companies willing to hire people from these target groups. UNAR has also drafted a multi-annual national strategy aimed at preventing discrimination towards LGBT people in Italy.

K

Kosovo

Overview of Country

The Republic of Kosovo is the youngest country in the world. It is home to the oldest ethnic group in the Balkan region of Europe. Kosovo is 6,778 square miles in area and borders Albania, Macedonia, Montenegro, and Serbia; 52.8 percent of the land is used for agriculture. Another 41.7 percent is forest. Its terrain ranges from flat fluvial basin that is 1,300–2,300 feet (400–700 meters) above sea level to the surrounding mountain ranges of 6,000–8,200 feet (2,000–2,500 meters). This relatively small country is rich in natural resources, such as nickel, lead, zinc, magnesium, lignite, kaolin, chrome, and bauxite, and it has the most coal reserves in the region (CIA 2016).

Ethnic Albanians make up 92.9 percent of Kosovo's total population (CIA 2011) of 1,883,016 (CIA 2016). Other ethnic groups include Bosniaks (1.6%), Serbians (1.5%), Turks (1.1%), Ahskali (0.9%), Egyptians (0.7%), Gorani (0.6%), and Roma (0.5%), according to a 2011 estimate. Religions primarily represented include Muslim, Orthodox, and Roman Catholic. Languages include Albanian, Bosnian, Serbian, Turkish, and Romani (CIA 2016).

Nine years after liberation from Serbia, on February 17, 2008, Kosovo declared and gained official independence. The framework for equality in Kosovo is imbedded in its

constitution and laws. From its inception, Kosovo has set multiethnic and gender standards of equality with its declaration of independence more civic than nationalistic in nature, promising dedication to protecting, promoting, and honoring the diversity of its citizen, and its constitution provides a clear legal framework for equality for all citizens, guaranteeing the rights and civil freedoms of every citizen (Republic of Kosovo 2008).

The World Economic Forum (WEF) has not officially included Kosovo in its Gender Inequality Index (GII), which benchmarks national gender gaps on economic, political, educational, and health criteria (WEF 2015). In almost every area of life and sector of government as they relate to gender equality or overall well-being of the women of Kosovo, there have been significant achievements and improvements in this young country; yet, there remains space for improvement. In education, women are now at least equally represented in primary and secondary schools, and they outnumber men in colleges and universities (Kosovo Agency of Statistics 2015). Though the dynamics of the workforce in Kosovo have changed dramatically in favor of equality and with significant focus on the issue from the government, there remains room for growth in the private and public sectors of the labor force as well as leadership and decision-making positions. Health care also remains an area of focus, especially in relationship to quality, accessibility, and assimilation of knowledge for preventative care.

Girls and Teens

Kosovo has one of the youngest population distributions in Europe with 43.5 percent of the population under the age of 25 and another 42 percent between 25 and 54 years old (CIA 2016). Of these age groups, women make up slightly less than half of the population. These young women of Kosovo have a tremendously positive outlook, and they are experiencing a dynamic focus shift in their favor with significant efforts being made for equal inclusion (Kosovo Agency of Statistics 2014).

Family Roles

Family roles are evolving in Kosovo as the country's political leaders strive to meet EU stipulations for gender equality and to fulfill its own constitutional standards of equality. Kosovar Albanians are traditionally patriarchal; the head of the household is the oldest man of the house, in some cases the oldest brother or uncle, but not always the father. The Albanian family unit takes responsibility for each member through a cycle of reciprocity. Parents support their adult children in education, marriage, work, and child-rearing, and then, as parents age, the children assume full responsibility for the parents' care (Latifi 2014). Women are responsible for the household, including home maintenance and care for every member of the family especially children and the elderly. As of 2014, the women of Kosovo spent 80 percent of their time on household chores and 10–20 percent working outside the home, while men spent 50–80 percent on work outside the home and 10–15 percent of their time at home (Agency for Gender Equality 2014).

Sports

In an effort to engage and empower the youth of Kosovo in public life, the Ministry of Culture, Youth, and Sport has developed action plans that are aimed at offering equal opportunities for sports participation and competition. It encourages the inclusion of men and women to represent Kosovo in international competitions. As with every other aspect of living, sports teams and athletic programs are in the development stages. Kosovars are working toward the organization and structure necessary for success in athletic training and competition as well as international acceptance of involvement in international competition. Success in this sphere included being recognized by the 205th national Olympic committee in December 2014, paving

the way for Kosovo to compete as an independent nation in the 2016 Olympics in Rio (Qena and Stojanovic 2014) which resulted in Kosovo's two-time judo world champion, Majlinda Kelmendi, taking home the gold medal in women's 52kg judo competition (Delauney 2016).

Women are also included in Europe's most popular sport; nine women's soccer clubs had been formed as of 2015. The latest club, Dukagjini, has received particular attention as several members have been considered by international scouts. The ages of these players ranged from 10 to 22 (BalkanInsight 2015).

Health

Life expectancy at birth in Kosovo is 70.2, 10 years lower than the EU average of 80.2 years (CIA 2016). Since the 1990s, Kosovo has experienced dramatic challenges and shifts in its health care system and health outcomes. In 1989, when Kosovo's autonomous status within the Republic of Serbia was revoked, the health care system was one of the hardest hit sectors. The Belgrade Ministry of Health assumed control, leading to a mass firing of Albanian health workers and a dramatic decline in access to health care with 50 percent of the population lacking access to health care. Albanians responded by developing a parallel primary health care system known as the Mother Teresa Society, which operated 96 clinics throughout Kosovo, offsetting some of the damage; however, the health of the population deteriorated throughout the 1990s, leading up to the conflict in 1998–1999, when violence and displacement took its highest toll.

The postwar health care system faced shortages of physicians and personnel, damaged and neglected facilities, inadequate supplies and equipment, and water and electricity shortages (Percival and Sondorp 2010). Postconflict health reform efforts are a part of other major social reform efforts and highly influenced by the international community of donors (Percival and Sondorp 2010). Both of these factors simultaneously strengthen and complicate implementation of the reforms.

The World Health Organization (WHO) developed the guidelines for Kosovo's new health care system, in which family-medicine teams would be developed to strengthen primary care and specialized care would be provided through referral from primary care. The size and location of facilities would be based on population demands, and all provisions of health care and employment would be non-discriminatory (Percival and Sondorp 2010). The result

was that family doctors were trained, family medicine centers were established, and legislation devolved responsibility for primary care and public health to the local level.

Access to Health Care

The law determines every citizen equal rights and access to health care. Health care is provided free of charge by the public health institutions for special groups, including children and young people younger than 15 years of age, students until the end of regular education, citizens older than 65, and disabled persons (Ministry of Health 2012). There are two types of insurance for all citizens and communities in Kosovo. The basic medical insurance is mandatory for all citizens who are in a formal work relationship, and private insurance is a voluntary insurance provided by citizens or employers (Ministry of Health 2012).

Maternal Health

In Kosovo, family medicine centers are responsible for maternal and child health care, including family planning, reproductive health services, and antenatal and postnatal care. However, the majority of women still visit a gynecologist rather than family physician for their antenatal care (Basha and Hutter 2006). Time constraints, especially in public facilities, limit doctors' ability to give adequate explanation and counseling. Doctors report 5- to 10-minute checkups with over 10 women waiting to be seen in public facilities. Private facilities offer more time to patients, but the expense is out of reach for most women (Basha and Hutter 2006). Travel costs are also an issue for many women who live in remote regions (UNICEF 2009).

Some positive trends in maternal health have been noted. Gynecologists report there has been increased interest in the care and health of pregnant women in the years following 1999. During pregnancy, women gain respect and are treated with care within the family. Women also show increased understanding of their own health care during pregnancy, which is evident in their determination to prioritize their own health and the health of the baby, increased attention to nutrition, regular punctual checkups, and careful attention paid to the health care providers during checkups (Basha and Hutter 2006). The percentage of women who give birth in a health facility and are attended by a skilled health professional was greater than 98 percent in 2013–2014. After birth, about 97.4 percent of women report staying in the health facility for at least 12 hours (Kosovo Agency of Statistics 2014).

Infant mortality rates, at 9–11 in every 1,000 live births, are double that of the EU average rate of 4 per 1,000 births, but they have significantly decreased from 2005, when rates were 44 per 1,000. This is in part because, until about 2010, babies were taken to nurseries directly following birth and not given back to the mother until her discharge from the maternity ward. Babies were also typically fed on intervals, or with formula or water and sugar, rather than on demand. Only 12 percent of infants under six months were exclusively breastfed. In 2013–2014, that percentage had climbed to near 40 percent, and nearly 97 percent of women who have given birth in the last two years, report having breastfed, 45.5 percent within one hour of birth (Kosovo Agency of Statistics 2014).

In 2009, Kosovo passed the first termination of pregnancy law since its liberation. The law provides for protection from forced termination as well as elective termination up to 10 weeks of pregnancy and the right to consultation for termination of pregnancy up to 22 weeks of pregnancy in the case of health conditions of mother or child or for criminological reasons (Ministry of Health 2008).

In 2014, the World Bank approved a USD\$25.5 million Kosovo Health Project to specifically support health spending for the poor and improve quality of care, with priority for maternal and child health equipment for primary care facilities and hospitals and noncommunicable disease services (World Bank 2014). In addition, thanks to the outreach of Kosovo's President Jahjaga to United Arab Emirates' Queen Sheikha Fatima, a donation of 22 million euros (USD\$25.6 million) will be used to build one of the most modern pediatric hospitals in the region, which is set for completion in 2018 (Jahjaga 2016).

Disease and Disorders

Noncommunicable diseases (NCDs) are an emerging priority in Kosovo, with respiratory conditions and circulatory disease key health indicators and already a major cause of morbidity and mortality. Due to the high rate of smoking and related incidence of cancer and heart disease (Percival and Sondorp 2010), in 2013, Kosovo adopted a tobacco control law that falls in line with WHO Framework Convention on Tobacco Control and includes measures said to be the strongest protection against the tobacco industry (WHO 2013).

In terms of communicable illnesses, tuberculosis (TB) is under close surveillance, and rates have decreased from 1,443 cases in 2002 to 968 in 2012 (Veen et al. 2013). As of

2013–2014, nearly 99 percent of children 12–23 months had received TB immunization coverage by their first birthday, and 78.5 percent of children 24–35 months had received all recommended vaccinations by their first year (Kosovo Agency of Statistics 2014). In relationship to HIV/AIDS, Kosovo is grouped among countries with the lowest rates of HIV/AIDS, with less than 1 percent of incidents among the general population and less than 5 percent among key populations at risk (UNAIDS 2014).

Breast cancer is the second most common cancer in the world and, by far, the most frequent cancer among women, with an estimated 1.67 million new cancer cases diagnosed in 2012 (25% of all cancers) (Shuleta-Qehaja, Sterjev, and Shuturkova 2015). A study of cancer incidence in Kosovo that focused on breast cancer between 1999 and 2004 showed it to be the most common cancer in Kosovo. The incidence shows an upward trend, increasing at a rate of 4.35 percent. In 2004, the incidence was 120 newly diagnosed cases per year (Krasniqi et al. 2007). According to the annual report for 2011 by the Kosovo Institute of Public Health (IPH), the most common diagnosis in tumors group classification was breast cancer (11.8%), whereas the number of women who detect cancer in its early phases remains very low (National Institute of Public Health of Kosovo 2011). Hence, in 2014, within the scope of early cancer detection month, the Ministry of Health received a mobile mammography machine, purchased through the initiative of the women members of parliament (MPs) of the fourth legislature of Kosovo. Since then, the mobile mammography machine team has offered its services to the women throughout Kosovo with the aim to aid women in both rural and urban areas to detect cancer early.

Education

Education in Kosovo is carried out by public and private institutions and is legislated and assessed by the Ministry of Education, Science, and Technology (established in 2002). In line with European contemporary standards, Kosovo adopted a system where primary education covers first through fifth grades, lower secondary covers sixth through ninth, and high secondary covers the next three to four years, depending on the path, which may be general or professional. By law, primary and secondary education is free; however, it is only mandatory from 6–15 years of age (Ministry of Education, Science, and Technology 2016). Current public expenditures on education are

at 4.7 percent of the total gross domestic product (GDP) (Ministry of Education, Science, and Technology 2016).

Preschool and Preprimary

For the 2014–2015 school year, 3,774 students were enrolled in preschools that served children ages 1–5, and 22,154 enrolled in preprimary schools serving children 5 and 6 years of age. Girls and boys are equally represented in preschool and preprimary schools; however, minority children are underrepresented (Ministry of Education, Science, and Technology 2015). The National Development Strategy includes a plan to increase overall enrollment by 5,000 by 2021. This will involve an increase in the number of public kindergartens, inclusion of private institutions, and optimizing teaching personnel with the goal to enhance cognitive development and performance in later stages of education and increase women's participation in the labor market (Office of the Prime Minister of Kosovo 2016).

Primary, Lower Secondary, and Upper Secondary

Kosovo has reached nearly gross enrollment for all mandatory levels of education. For the 2014–2015 school year, there were 273,649 students in 985 schools throughout the country, with equal representation among male and female students in primary (grades first through fifth) and lower secondary (grade sixth through ninth) (Ministry of Education, Science, and Technology 2015).

There are 120 upper secondary public schools throughout the country with a total of 83,743 students and equal representation of male and female students enrolled for the 2014–2015 school year (Ministry of Education, Science, and Technology 2015). Kosovo offers two primary paths for upper secondary education: gymnasium, which prepares students for higher education, and vocational, which prepares students for the workforce. Currently, there is almost equal enrollment in each of these paths, with gymnasium up by only 0.4 percent (Ministry of Education, Science, and Technology 2016). At the completion of upper secondary, students are required to take the State Matura Exam with the purpose of proving the level of knowledge of the student for work and continuing the tertiary education (Ministry of Education, Science, and Technology 2015).

Strategic plans for upper secondary education include developing a national test for teachers and a teacher

licensing system; building a stronger connection between teacher evaluation and pay systems; expediting the process of teachers' professional development with a special focus on science, technology, engineering, and math (STEM); expanding the adoption of new curriculum; reviewing existing textbooks; and developing new curriculum in line with expected learning outcomes. A more credible final test following fifth grade will also be implemented as well as a teacher grading and evaluation system (Office of the Prime Minister of Kosovo 2016).

Postsecondary, University, and Job Training

Due to a significant increase in higher education enrollment over the past six years, Kosovo is now one of the most densely student-populated countries in Europe, with 6,669 students per 100,000 people (Ministry of Education, Science, and Technology 2015). For the 2013–2014 school year, more women than men enrolled in higher education programs, with a combined total of 122,000. Though increased enrollment is a positive trend, the challenge now is to provide quality in education with these increasing demands for expansion of infrastructures, faculty, and staff. With more than 400 study programs, there are currently 7 public universities and 30 private colleges; however, 30 percent of the student population studies at private institutions (Istrefi 2015).

In 2001, the University of Pristina adopted the EU Bologna Declaration, which led to reforms affecting all institutions of higher education in the country in relationship to credit systems, curriculum reform, a three-cycle degree system, student and staff mobility, diploma supplement, and quality assurance system (Istrefi 2015; European Commission 2016).

Three of the greatest challenges related to higher education currently being addressed are (1) the disconnect that exists between vocational school and higher education learning outcomes and the needs of the labor market, (2) the nonsystematic funding of the education system, and (3) the need for an increase in scientific research (Ministry of Education, Science, and Technology 2015). Over the next several years, the National Development Strategy will attempt to strengthen the connection between all education programs and labor market demands by creating a skills-forecasting system and developing coordination between university research work and industries and as well as practical vocational training with industries (Office of the Prime Minister of Kosovo 2016).

Employment

Kosovo is not a member of the United Nations, which is considered a key obstacle to political integration and socioeconomic development (World Bank 2015a). Regardless, Kosovo has drafted advanced legislation based on internationally recognized principles of gender equality and has ratified a number of international agreements and legally binding norms, which according to the Kosovo Constitution have superiority over the laws of the Republic of Kosovo (Republic of Kosovo 2008). To speed up its integration process into the European Union, Kosovo has gone through the course of negotiation of the Stabilization and Association Agreement (SAA) whose Article 106 on social cooperation expects Kosovo's alignment with the EU *acquis* in the field of labor law and women's working conditions (European Commission 2015).

In April 2008, the Government of Kosovo approved the Kosovo Program for Gender Equality, which also requires a greater commitment of interested parties (Agency for Gender Equality 2008). Establishment of institutional mechanisms and affirmative measures for gender equality in all levels has created a positive environment for inclusion of women in the labor market and decision-making process. There are two entities in the Office of the Prime Minister that are responsible for monitoring government bodies in the sound implementation of human rights, gender equality, and good governance. The Office for Gender Equality was established in 2005, which was transformed into the Agency for Gender Equality (AGE), within the Office of the Prime Minister, in 2006. The Advisory Office on Good Governance, Human Rights, Equal Opportunities and Gender Issues (AOGG) was established in 2002 and functions within the Office of the Prime Minister. It is mandated to mainstream the promotion and protection of human rights across policies and activities of the government of Kosovo.

The contributions of civil society and the media in raising awareness have been an important factor. Women activists have also contributed to increase the number of women in all spheres of life. They have worked with young girls and women as well as men throughout Kosovo to convey the importance of education, which has had positive results. Hence, the percentage of educated women has evolved through the years, not only in secondary high schools but also in higher education, where the ratio of students is in women's favor: 52.9 percent women and 47.1 percent men (Kosovo Agency of Statistics 2015).

In the meantime, the number of employed women in government and the private sector has also increased. Legal regulation of relations between the employer and the employees, working hours, salary, night shifts, and maternity leave have contributed to this increase, although there is still much to be done to reach aimed quotas.

Inclusion of Women in the Working Market

The process of women's economic empowerment in Kosovo has not been an easy venture, as it still encounters numerous problems that are mostly related to traditionally established gender roles. This has particularly been experienced by the women living in rural areas, as they are still marginalized and have relatively limited access to all resources.

The annual report on labor and employment shows that the total stock of persons registered as job seekers with the Kosovo public employment offices at the end of 2014 consisted of 127,921 women (compared to 146,566 men), though according to the researchers in this field, this is not the real unemployment picture. Moreover, a worrisome fact, highlighted on several occasions by civil society and media, is that among the job seekers are young women and men with higher education, which perhaps means that educational institutions have "produced" a considerable number of educated persons without a proper preparation for the working market. Hence, this problem coupled with limited employment opportunities make it difficult for young people to access and retain jobs (Benzenberg 2015, 7).

In this context, it is worth mentioning that participation of women in the labor force, according to the *Annual Report of Industrial Development in Kosovo for 2014* by the Ministry for Trade and Industry, has marked an increase by reaching the value of 21.4 percent, compared to the previous years that had a value of only 17.8 percent (Ministry of Trade and Industry 2015).

Against Stereotypes

Women in Kosovo have entered all spheres of public life; they have entered even the so-called male-dominated professions, such as the police force, with women being around 14 percent of those in uniform and 10 percent of civil staff and the security force. During the last few years, Kosovo has gone through a very dynamic political life that has been enabled by the Election Law of Kosovo and the Law on Gender Equality, which calls for both women

and men to hold at least 40 percent of positions at all levels of decision making (Assembly of Republic of Kosovo 2008; Official Gazette of the Republic of Kosovo 2015). Because of active participation during the electoral campaign, although men still occupy most of the high-level decision-making positions in the country, in 2011, Kosovo elected the first woman president in the Balkans (Office of the President of Kosovo n.d.). As of the 2014 parliamentary elections, 32.5 percent of the seats are occupied by women, although out of 20 ministers in the current Kosovo government, only two are women (Office of the Prime Minister of Kosovo 2016). The last local elections in 2013 resulted in an increased number of women in decision-making positions at the municipal level, from 30 percent to approximately 34 percent. Furthermore, because of these elections, the city of Gjakova elected Kosovo's first woman mayor. This is a significant sign that women's role in state building has finally been acknowledged, which will help to motivate young women to further work on the gender equality agenda.

Another worthy and welcoming trend is the dramatic increase in the engagement of women in diplomatic missions. In 2016, out of 23 Kosovo embassies, 8 are represented by women in addition to several women who have been appointed as heads of consular services (Ministry of Foreign Affairs 2015).

Labor Market and Gender Differences

As emphasized earlier, Kosovo has a very advanced legal framework that regulates employment and equal gender representation. What still needs to be changed is how women are perceived by the part of society that is still skeptical when it comes to the role of women in business. At present, only approximately 21.4 percent of women of working age are active in the labor market, compared to 61.8 percent of the male population of working age. Labor Force Survey (LFS) data shows that there are large gender differences throughout the labor market, specifically regarding self-employment, where only a slight growth has been registered over the past few years (World Bank 2015b). The percentage of women who are self-employed without employees is larger compared to the businesses run by men.

According to the statistics, family responsibilities were the main reason for women's inactivity in the labor market, with 38.8 percent of female respondents giving this reason, which has been in a way also confirmed by Brikena

Sylejmani, a women's rights activist (UNDP in Kosovo). On this point, Sylejmani said that when we talk about the position of women in the public sector, figures indicate a significant percentage of employment of women in technical and assisting positions more than in managerial or decision-making positions. According to her, this happens due to the influence of political parties during the procedures of employment and because of the reluctance of women to apply and fight for decision-making positions; women see these positions as a very demanding and requiring more time dedication, which is considered a limiting factor due to family reasons and obligations. It is important to mention that women are mostly employed in the education and health sectors, consisting of almost 40 percent of employed women, whereas men are mostly employed in the manufacturing, trade, and construction sectors, consisting of more than 40 percent of employed men.

Women Entrepreneurs

In today's Kosovo, women are present in all institutions and organizations, as the Labor Law regulates their employment as well as the Law on Civil Servants and the Law on Gender Equality. Still, there are two worrisome facts with which Kosovo society needs to be concerned: the low number of employed women and the low number of women in private sector. Despite the favorable Article 49 of the Labor Law on Maternity Leave, through which an employed woman is entitled to 12 months of maternity leave, there are still cases where women do not return to the workplace after giving birth. Or, there are employers who fire women as soon as they find out that they are pregnant because they do not want to pay for their maternity leave, although the law is (sensibly) favorable. According to the law, the first six months of maternity leave are covered by the employer with the compensation of 70 percent of basic salary, whereas the following months, the maternity leave is paid by the Government of Kosovo with the compensation of 50 percent of average salary (Republic of Kosovo 2008). The Law on Civil Servants, whose Article 36 covers working hours, paragraph 1 specifies that civil servants' working time shall not exceed 40 hours per week, and paragraph 3 states that pregnant women and mothers with children up to three years old shall not be required to work night shift nor more than 40 hours per week (Assembly of Republic of Kosovo 2010). This has been respected in all Kosovo institutions, but it is not respected in the private sector, with the exception of small businesses that are run

by women, which account for only 6 percent Kosovo's business owners.

Of businesses run by self-employed women, according to the statistics, the profession of hairdressers is the most widespread (40%), and the second is beauty salons (27%). There are other professions that are labeled as women-centered, such as nursing and kindergarten owners, which are represented with only 8 percent in the labor market. According to statistics, there are women who are operating driving schools, Internet cafes, and insurance companies, among other businesses, though they are considered traditional male businesses (Kosovo Agency of Statistics n.d.).

Women's in Agriculture

According to statistics, 49.4 percent of women work in public sector, but there are also 54 percent of women who own land and are heads of an agricultural household, out of 8.3 percent of the households that are headed by a woman. When covering self-employment, it should also be mentioned that two-thirds of the population lives in rural areas and develops family economies mainly in the agricultural sector. Women make indispensable contributions to the agricultural and rural economies. As revealed in the 2010 census, when households are headed by a woman, in 64.1 percent of cases, she is a widow and the main source of living is "support by others" (Kosovo Agency of Statistics n.d.). Their activities typically include caring for family members and maintaining their homes, producing agricultural crops, tending animals, and food preparation and processing, and these activities are not defined as active employment. Hence, to get the most from local resources, there is much to be done in agriculture, an important engine of growth and poverty reduction (World Bank 2008).

Tremendous efforts of the national institutions and the international community have taken place during the last 10 years to revitalize agricultural development in Kosovo and through it economic growth and food security. To strengthen and accelerate their contributions, numerous actions have taken place, and financial aids have been released for agricultural activities undertaken by women, though until now most of the funds have been dedicated to the organized groups of women in home food processing. In some cases, funds have not been released because the property is in the name of a man, usually in the name of the father, brother, or husband, as the women's property ownership is estimated at 8 percent. Legislation offers

equal rights to inheritance for children in and out of marriage, but during the inheritance disbanding in courts, women often waive their right to inherit, giving their share of family property to their brothers, a practice that is part of the established national mind-set (Agency for Gender Equality 2014). This occurrence is especially evident in the more remote areas of Kosovo.

Family Life

Though under permanent social and political changes, families in Kosovo are still close to each other. Nowadays, most families consist of the parents and children until the latter wish to live separately (Assembly of Republic of Kosovo 2004). According to Brikena Sylejmani, women in Kosovo carry the main burden for families in terms of care for children and for the family in general. Moreover, Sylejmani attests that this has influenced the position of women and has affected and prevented them from gaining independence and from entering decision-making positions in society.

Because of emancipation, women are better educated and have better-paying jobs; hence, the average age of marriage for women has risen to 27.4, and it is 31.1 years for men. The fertility rate averages 1.9 children per mother, which when compared with the fertility rate during the 1990s, 3.9 to 3.0 children, is quite low. The reason behind this decrease is that after the war, with the deployment of international organizations, the need for English-speaking employees emerged. Young boys and girls who could speak English became active and very focused on getting jobs to help renew their families' economies and to rebuild destroyed houses, which resulted in postponing marriage and having fewer children once married (HRW 1999).

In Kosovo, divorces during the postwar period have been more frequent in comparison to the past. The top age group for women to divorce is 25–29 years old (26.3%), and for men, it is also 25–29 years old (25.9%) (Kosovo Agency of Statistics n.d.).

Child Adoption

Children are a very important part of Kosovo society. Article 22 of the Constitution of the Republic of Kosovo includes human rights and freedoms guaranteed by the international agreements and instruments as well as the Convention on Children Rights, which is the most important international instrument that recognizes children as the most vulnerable members of society and oversees

and requires rights and special protections for children (Republic of Kosovo 2008). Thus, Kosovo has no orphanages for children, and foster care is being developed as one of the best alternative forms of child protection (KOMF 2014). To ensure that every child grows up with love, security, and respect, the government of Kosovo cooperates with SOS Children's Villages Kosovo, a nongovernmental organization (NGO) that was established to provide homes and families for children without parental care (SOS Children's Villages Kosovo 2015).

The Law on Social and Family Services covers the very sensitive issue of the fates of abandoned children. It oversees and regulates alternative forms of child care, such as adoption. The adoption of a child is permissible if it serves the child's well-being, and it is to be expected that a parent and child relationship will be created between the prospective adoptive parent and the child (Assembly of Republic of Kosovo 2011).

Domestic Violence

For the time being, in Kosovo, the most disturbing issue remains domestic violence, a behavioral pattern that has been identified as a problem by many societies. Prohibited by law in the Protection against Domestic Violence (Assembly of Republic of Kosovo 2010), domestic violence remains one of the most prevalent forms of gender-based violence that is experienced predominantly by women around the world, preventing them from enjoying their human rights and fundamental freedoms (Assembly of Republic of Kosovo 2010; United Nations 1995). Commonly known as a violence that occurs in a private dwelling between spouses, data has shown that it is also committed against children and other cohabitating individuals, such as men and elderly persons (Farnsworth et al. 2008). Statistics gathered by Kosovo Police show that, in 2014, 1,179 incidents were reported across all of Kosovo and that the majority of victims were women and the majority of suspects were men (Kosovo Agency of Statistics n.d.). Reliable data and information about the domestic violence in Kosovo before 1999 is lacking, but according to the 2008 study, 43 percent of Kosovo women and men have suffered domestic violence at some point in their lives (Farnsworth et al. 2008).

In postwar Kosovo, a worrisome fact was that victims felt that they should not talk about the domestic violence, which was often considered by the representatives of public safety institutions as a private issue that should be

resolved within the family. This perception, the mentality of the society, and the inability of institutions to ensure access to justice for all victims of domestic violence represent a challenge and are the contributing factors to the persistence of the problem. Hence, law enforcement agencies whose responsibility it is to investigate, prosecute, and penalize perpetrators of domestic violence need to engage more to send a clear message that such acts will not be tolerated and that they are in a position to offer effective remedies for victims.

A number of efforts have been made in recent years to achieve such responses in Kosovo. An institutional structure has been established under the National Coordinator's Office against Domestic Violence that aims to prevent domestic violence and to improve the responses for victims in terms of protection, rehabilitation, and reintegration (Ministry of Justice, National Coordinator's Office against Domestic Violence 2012). Given that Kosovo Police are often the first responders to incidents of domestic violence, their responsibilities are outlined under Article 24 of the Law on the Protection against Domestic Violence, which clearly stipulates that police must respond to all reports of domestic violence and arrest the alleged perpetrator. Police must also complete a number of other actions, including, but not limited to, informing the victim of his or her rights, informing relevant service providers about the case, providing transport for the victim to a medical facility, and providing transport for the victim to a shelter, if requested by the victim (Assembly of Republic of Kosovo 2010).

Moreover, to gain the trust of victims, a female officer is always part of the patrol sent to a domestic violence scene, and she remains at the scene until the specialized domestic violence investigator arrives who is responsible for providing a shelter for victims. There are six shelters in Kosovo for women who are victims of domestic violence, where they can stay for six months. When a victim arrives at the shelter, she is provided with a resting period of 48 hours. The shelter then takes a statement, and if the victim desires, psychological and social services are provided. After that, the victim's case file is sent to the Centre for Social Welfare.

To raise awareness of the victims of domestic violence about possibilities for protection, civil society organizations have provided great contributions. They have engaged in numerous activities after which considerable advancement has been made in reporting and combating violence against women (Kosovar Gender Studies Centre 2008).

Domestic violence is not a matter of choice and does not result solely from alcohol or drug abuse, physical or mental illness, or a problematic relationship (OSCE and USAID 2008, 33). Kosovo's poor socioeconomic conditions, including high rates of unemployment and financial instability, contribute to domestic violence, which highlights the role of employment of women as well as the need to decrease the unemployment rate (Buzawa, Buzawa, and Stark 2012, 107). Through the decrement of contributing factors, a decrease in the number of domestic violence incidents will be reached over time, which will contribute to the end of the culture of violence.

Same-Sex Marriage and LGBTI

Kosovo is one of few European states to have constitutionally banned discrimination on the ground of sexual orientation. According to the former president of the Constitutional Court of Kosovo, Enver Hasani, during a visit to SMU Dedman School of Law in Dallas, same-sex marriage is legally permissible in Kosovo, as Article 37 of the Constitution of Kosovo addresses the issue of marriage, stating that based on free will, everyone enjoys the right to marry and the right to have a family as provided by law (Fowler 2014; Republic of Kosovo 2008, 11). According to Hasani, because there is no mention of gender or sexual orientation, the law can be interpreted as being inclusive. On the other hand, the Family Law of Kosovo, Article 9, on engagement, clearly stipulates that an engagement is the mutual promise of two persons of different gender to get married in the future. Also, Article 14, paragraph 1, defines marriage as a legally registered community of two persons of different sexes, through which they freely decide to live together with the goal of creating a family. Because the Constitution of Kosovo is the highest legal act, it can be considered that same-sex marriages are not explicitly forbidden and that the Law on Family should be amended in accordance with the Constitution.

Despite the advanced Constitution, Kosovo society remains deeply traditional and even hostile toward sexual minorities, as they believe that LGBT individuals are deviant or suffer from a mental illness (Fauchier 2013). Hence, though a small number of LGBT individuals have dared to break the silence and speak out, they still socialize in closed groups and are not that visible, which has been an increasingly common reason for asylum seekers from Kosovo to claim sexual orientation as a ground of persecution and a right to asylum.

Women in Politics

Aside from ensuring that the basic rights of both genders are respected, women's inclusion in electoral and political processes has multiple benefits for everyone and contributes to better governance (Manual for Gender Equality in the Electoral Process 2016). Women's participation in Kosovar institutions is low, including in politics. While gender equality in Parliament has improved, thanks to the implementation of quotas, the inclusion of women in electoral processes remains a challenge. Women are inadequately represented among election staff, and until misconceptions about their competency and suitability are overcome, their voice in politics will not command the respect they deserve.

The 30 percent gender quota for candidate lists has resulted in more women being directly elected without the need of the quota. For the first time, in the 2014 parliamentary elections, 20 out of 39 women members of parliament did not need the quota to be elected for these positions. However, while a growing number of women are elected to Parliament, their inclusion in electoral processes lags behind. In the same elections, the percentage of electoral staff filled by women was only 20 percent, marking a small increase from the 17 percent in the municipal elections in 2013. The percentage of women in field-level management positions is even lower (Tota 2014).

Religious and Cultural Roles

The Constitution of Kosovo establishes the country as a secular state that is neutral in matters of religious beliefs and where conscience and religion are guaranteed (Republic of Kosovo 2008). Four religions, Islam, Orthodoxy, Protestantism, and Catholicism, have a long history of coexistence in Kosovo. As Albanians do not define national identity through religion, but through language and tradition, they have a relatively relaxed approach toward the observance of all forms of religion. Moreover, neither religious leaders nor religion have played any significant roles in Albanian history, in the past nor in recent history. However, most Kosovo Serbs do consider Orthodoxy to be an important component of their national identity.

Kosovo has a unique community known as "Laraman" (colorful) who are converts. For approximately 200 years (since the Ottomans), these Albanians have practiced two faiths, Islam and Roman Catholicism. During the Ottoman

occupation, Islam was practiced publicly during the day, and Catholicism was observed secretly at night to avoid punishment. As part of this tradition, even today, names and family names have elements of both religions, Islamic and Roman Catholic; for example, Mark (Roman Catholic name) Abazi (Islamic surname), or Dom Shan Zefi, the chancellor of the Kosovo Diocese, and Demush Zefi, his brother and a well-known journalist, whose first names are Islamic and surnames are Roman Catholic. The most emblematic Albanian figures are Gjergj Kastrioti Skenderbeu (George Castriot and his alias, Skanderbeg), and Mother Teresa; their names have been given to the two biggest boulevards in Prishtina.

Moreover, Kosovo and Albania never showed any sign of anti-Semitism during World War II and helped the Jews. In April 1941, Kosovo was annexed to Italian-controlled Albania. By September 1943, both territories were under German occupation. Throughout this period, including the attempt to turn over Jews to Nazi authorities en masse, Albanians refused to cooperate. They hid Jews in their homes, provided them with food and clothing, and gave them Muslim names and fake documentation. In Kosovo, 258 Jews were deported to Bergen-Belsen, 92 of whom perished. But more than 2,000 Jews were saved throughout Albania and Kosovo (Hoare 2013).

For a random visitor, the streets and boulevards of Kosovo are similar to those in other European countries. The way women and men act and the way they are dressed are clear signs that the Kosovo society is Western oriented.

When it comes to women's representation in the cultural sphere, Kosovo has been represented in Europe and beyond through young artists engaged in a number of opera houses in Europe and also through the singer Rita Ora, who lives in the United Kingdom, but her family is from Kosovo; singer Dua Lipa; and songwriter and singer Era Istrefi. Since 1999, the National Theatre of Kosovo has been managed by two women whose contribution to the arts, especially in film and theater directing, is worth mentioning.

Due to the large number of artists, Kosovo hosts a number of theater, film, music, and visual art festivals whose managers and organizers are women, such as FemArt, the only feminist festival in Kosovo and the biggest feminist festival in the Balkans; the international students' festival SkenaUp; and the international documentary and short film festival DokuFest. Hence, it can be said that the contributions of women in art are recognized, and women are well integrated.

Highlights of Accomplishments of Women in Kosovo

The women of Kosovo have played a key role in the success of Kosovo's building of a democratic state by focusing attention on the future rather than the past and forging paths for peace, security, inclusion, and reparation.

Atifete Jahjaga

Atifete Jahjaga, Kosovo's first women president, first non-partisan candidate, first candidate to be voted in office in the first round of voting, and Europe's youngest female head of state, is known around the world as a tremendous example of public service. Jahjaga began her career in the police force with two primary goals, in both of which she is recognized as having found success: to build trust in the law enforcement institution so that it might serve the people and to involve women in the process to bring about its success. As president, Jahjaga has strengthened Kosovo's sovereignty and international relationships, democratic formation and function of the government, the electoral process, relationships with Yugoslavia, rule of law, peaceful relationships among various ethnic groups within the country, and partnerships between the government and the people of Kosovo (Republic of Kosovo 2008). To enhance women's leadership roles in Kosovo, Europe, and around the world, she is a member of the Council of Women World Leaders, and under her leadership, Kosovo hosted the International Women's Summit "Partnership for Change—Empowering Women," with more than 200 women from all over Europe, North America, Africa, and the Middle East in attendance (Alexander, Koppell, and Shauket 2012).

Edita Tahiri

Edita Tahiri, a Harvard graduate with a PhD from the University of Pristina in cooperation with John Hopkins University and now serving as minister of dialogue, was a founder and key leader of Kosovo's movement for independence as Minister of Foreign Affairs of Republic of Kosovo (1991–2000). During this time, she played a key role in drawing international recognition to Slobodan Milosevic's oppression and genocide of the Kosovar people and in negotiating the Rambouillet Peace Conference (1999), which led to NATO intervention and eventually Kosovo's independence. As deputy prime minister from 2011 to 2014, Tahiri negotiated the last European Territory

conflict (the first in-person negotiations between Serbia and Kosovo) and has been Kosovo's chief negotiator at the Brussels Technical Dialogue with Serbia since its beginning in 2011.

She is also the president of reformist party Democratic Alternative of Kosovo (ADK) and is a founder and the chair of the Regional Women's Lobby for Peace, Security and Justice in Southeast Europe (RWLSEE), which includes 23 members from 7 difference countries (Croatia, Montenegro, Albania, Serbia, Macedonia, Bosnia, and Herzegovina) interested in the role of women in decision-making, peace, and security processes in Southeast Europe. The group actively promotes and explores women's role in speeding up Euro-Atlantic integrations and has successfully opened dialogue between leaders of Kosovo and Serbia and is addressing the concerns from women of all ethnic backgrounds within Kosovo (Regional Women's Lobby in Southeast Europe 2015).

Arbana Xharra

Arbana Xharra, the editor in chief of the Kosovo daily *Zeri* and an alumna of the Balkan Fellowship for Journalistic Excellence, is an investigative journalist from Kosovo. Xharra is a three-time winner of the UN Development Programme's prize for her articles on corruption in Kosovo in 2006, 2007, and 2008. In 2012, she was awarded a Balkan Fellowship for Journalistic Excellence and studied the changing attitudes toward Islam in Kosovo. In 2013, she was awarded the Rexhai Surroi Award by the KOHA Group for an article on extremism and the Stirring Up Debate Award from INPO Ferizaj (Progress Initiative) for creating public discourse on religious extremism. In 2015, she was awarded the U.S. Secretary of State's International Women of Courage Award for the European division.

Valdete Idrizi

Valdete Idrizi is the executive director and founder of the NGO Community-Building Mitrovica, which works for peace and builds community in the Mitrovica region in northern Kosovo. Idrizi is an ethnic Albanian from North Mitrovica who lost her home in 1999 when Serbia invaded, but through her NGO, which funds more than 200 projects, she is working to link Albanians, Serbians, and Roma to heal the wounds of the war (Poggioli 2008). In December 2011, CiviKos, an initiative of civil society organizations in Kosovo, "aimed at creating an enabling environment for cooperation of formal civil society sector and the

Government,” chose Idrizi as executive director (Platforma CiviKos 2015). In celebration of International Women’s Day 2008, Secretary of State Condoleezza Rice presented the second annual Award for International Women of Courage to eight women from around the world, including Valdete Idrizi (U.S. Department of State 2008). Idrizi also received the 2009 Sopromist International Peace Award (Sopromist International 2011, 48).

Igballe (Igo) Rogova

Igballe (Igo) Rogova has been actively involved in women’s rights in Kosovo since the 1980s, and by 1989, she had started the first women’s rights organizations in Kosovo. In 1999, she began serving as executive director of the Kosovo Women’s Network, a multiethnic network of 100 women’s organizations. Her focus, as with many others, has been on protecting women’s rights and preparing women for leadership roles in decision-making and peace processes. She received the Woman of the Year Award from the International Network of Women’s Organizations, as well as the Lydia Sklevicky Prize for innovative work with women’s groups.

Aferdita Syla

Aferdita Syla is one of the nearly 1 million refugees who fled the terror of Slobadon Milosovic. She returned to Kosovo in the summer of 1999 and immediately began helping people through the International Rescue Committee and then led the Gjilan Youth Center to help youth focus on their futures. She then joined the International Democratic Institute to focus on women’s postconflict issues. She also leads the Informal Group of Women Parliamentarians, which seeks to encourage and prepare women for involvement in the political process and to link women parliamentarians to women in local governments to promote grassroots policies. In 2012, Syla won the Andi Parhamovich Fellowship (National Democratic Institute 2012).

Latvia

Overview of Country

Latvia is a country on the coast of the Baltic Sea; it shares a border with Lithuania, Estonia, Belarus, and Russia. The land of Latvia is split in two by the Daugava River. The south side of Latvia is covered with plains, and the north and east have hills and lakes. The land also has swamps, small lakes, and dense forests. Latvia is about 24,940 square miles, and as of 2013, there are 2.013 million people living there. Latvia's biggest city and capital is Riga, which is located in the Gulf of Riga on the northwestern edge of the country.

Latvia became a country that was recognized by the United Nations in September 1991. Prior to being an independent country, Latvia had a long history of being ruled and occupied by foreign bodies of government. In the 1500s, Germany occupied the country, creating the upper class. In the mid-1500s, Poland gained control until Sweden took command in 1629. After Sweden, Russia controlled Latvia from 1721 to 1918. While Latvia was occupied by Russia, Latvians kept their heritage and language alive and preserved. In the middle of the Russian Revolution, Latvia gained independence in 1918, although it would be an unstable country, politically, and fall under a dictatorship with President Karlis Ulmanis. Latvia was occupied by Russia once more and became a part of the Soviet Union in 1940. After World War II and an occupation with German

troops, Latvia gained independence and became its own country.

Most of the Latvian population lives in cities, and although Latvian is the only state language, the *CIA World Factbook* reports that only 56.3 percent of the population speaks Latvian in their homes. Russian is the next most spoken language in Latvia at 33.8 percent of the population (CIA 2016). Other languages include Polish and Ukrainian. On the UN Development Programme's Gender Inequality Index (GII), Latvia is ranked 48th out of 178 nations (0.222) (UNDP 2016).

Girls and Teens

Latvians are very "reserved, professional, and formal," but once they open up to friends and acquaintances, they are "warm, inviting, and trusting" (ProQuest 2012, 1–5). Young people tend to dress more formally than in other countries, such as the United States. Latvia's literacy rates are equal between men and women, and many higher educational institutions are located in Latvia.

Family Roles

Within the family, there is great pride and patriotism for Latvia, and this is taught to children at a young age. This is said to be because of the Soviet occupation and the fact that the Latvian culture has been preserved

throughout the years. Latvian families tend to have two children. These children are expected to help around the house in gendered roles. Girls tend to do chores in the kitchen, such as washing dishes and cooking or helping their mothers with the gardening. Boys help their fathers with repairs or farming, depending on whether the family lives in a rural or urban household. Many times, to save money, Latvian households will have three generations. While the parents are at work, it is not uncommon for the grandparents to look after their grandchildren. It is common and expected that the family will eat together during their meals.

Recreation

Many sports are popular in Latvia, but because of its northern location, winter sports are the most popular. Because of national patriotism, cultural festivals are popular. “Folk music and dance traditions are alive and play a large role in everyday life” (Study in Latvia 2016). In fact, children are taught national songs and dances at an early age. In a study conducted on television viewing habits, Latvian girls between the ages of 12 and 15 were shown to watch about 1.4 hours per day, while girls ages 16–19 watch even less at 1.2 hours per day. Boys’ television watching was slightly higher at 1.8 and 1.6, respectively (Larson and Verma 1999, 716).

Education

Latvian children begin attending school at age 6 and continue until they reach grade nine (primary school) or turn 16, although in extenuating circumstances, primary schooling can be extended until age 18. Primary school is mandatory. School years last from September to May, a total of 36 weeks. When a student decides to go to secondary school, grades 10 through 12, which is about 55 percent of students from primary school, they must complete “at least twelve elective subjects and successfully pass five final examinations” (Academic Information Centre 2016). Within secondary school, there are five subjects that must be taken. These include “Latvian language and literature, mathematics, foreign language, history, [and] physical education” (Academic Information Centre 2016). Seven elective subjects must be taken as well. This elective list is much longer and includes topics such as chemistry, music, amateur performances, housekeeping, and physics. After finishing secondary school, students can elect to further

their education at one of many higher-division educational institutions.

Latvia is home to many higher-division educational colleges that are state funded as well as private. Many of these colleges are located in Latvia’s biggest city and capital, Riga. These include the Riga Technical University, Riga Stradins University, the Stockholm School of Economics in Riga, the Riga Graduate School of Law, and, most notably, the University of Latvia. To get into these colleges, students must have a certificate of completion from their general secondary school, take “one to four competitive entrance examinations” (Academic Information Centre 2016), and sometimes go through an interview with the board of admissions for the specific college or university.

Women attending Latvian colleges are not uncommon; in fact, at the Academy of Culture, female students make up 70 percent of the student body. Additionally, women are not only participating as students; many are also teachers and lecturers. But women are still “significantly underrepresented in the decision-making bodies” of many universities, and the careers of lecturers and researchers do not pay very well (Novikova 1996, 441). Women have had to search for research positions in private companies, as the schools either do not pay as well or have had to cut their research funding.

According to the ILGA-Europe, “The Latvian educational curriculum is strictly gender biased, representing [the] strong heteronormative and sexist role[s] of the man and [woman]” (ILGA-Europe 2016). Homosexuality and transgender issues are not discussed or a part of the curriculum in Latvia and are only discussed if the teachers want to.

Education Reform

The educational system went through a complete reform in 2004, when the number of classes taught in the native language of Latvian increased from three to five. This created a hardship on schools, which housed a majority of Russian speakers, but “40 percent of the total number of subjects are still being taught in the minority language” (Ministry of Foreign Affairs of the Republic of Latvia 2005). This reform only applied to secondary schooling, grades 10–12. The reason for the reform was “to create an education system capable of providing equal opportunity in the labor and education markets for graduates” from all the schools in Latvia, regardless of language taught in (Ministry of Foreign Affairs of the Republic of Latvia 2005). While this reform was hard on teachers, they were

offered free teacher training courses and received a bonus for teaching in more than one language.

Women's Studies

It is almost impossible to find a women studies program in Latvia. "Women's studies is viewed negatively as uprooting tradition" (Novikova 1996, 440). There is no formal women studies program in any college, and it has not been developed "as a teaching project" either (443). If any research is done involving women studies, it is a part of a much greater, more general project and does not focus on gender or women. This is because there is not a big enough societal focus on women studies in Latvia.

Adult Education

Latvia's adult education program is very well developed, thanks to the "principle of lifelong education" (State Education Development Agency 2007). Focusing primarily on unemployed adults, free classes are available. These courses focus on training for labor jobs and account for "the largest number of participants in the adult education sector" (State Education Development Agency 2007). Many times, companies pay the training costs for employed adults to go to vocational schools to learn certain trades. These courses are two to three years in length and focus on "mastering professional skills and knowledge in line with the requirements of the respective qualification level" (State Education Development Agency 2007). If adults want more than vocational training, they can also attend evening classes for the general secondary education as well as the basic program.

Health

The health care system in Latvia operates through the state and is funded with national taxation. Local governing bodies must be a part of this state system, and they spend a minimum amount on health care each year (Europe Cities 2016). This program is free to all citizens and covers many different ailments, including "serious diseases, preventive healthcare, child and maternity care, emergency treatment, the treatment of sexually transmitted and infectious disease, surgery, rehabilitation, [and] immunization programs" (Europe Cities 2016). For children under 18, this program also covers free dental treatment. Employees and employers both pay a minimum amount. This payment insures "against accidents at work and sickness during

employment" and covers the dependent members of the family (Europe Cities 2016).

Access to Health Care

The health care system in Latvia is mainly public, with a few private health care options. The public system is "accessible to all residents but lacks funding and supplies" (ProQuest 2012, 1–5). Equipment and buildings may be out of date and in need of refurbishment. Private health care also exists in Latvia, but it is too expensive for the majority of the population and mainly does the same things as the public health care system. A benefit of private health care in Latvia is newer buildings with newer, more advanced equipment. There is "no legal recognition of the needs of LGBT patients" in regard to health (ILGA-Europe 2016).

Maternal Health

In Latvia, pregnant women are considered a part of a vulnerable group in society and therefore do not have to pay any charges, which would include doctor appointments and referrals. Postdelivery examinations are also free. Most pregnant women have access to prenatal examinations and give birth with trained personnel. It is harder for women in rural areas, as they are farther away from the bigger hospitals and their "local hospitals . . . are not well equipped" (Putzi 2008, 184). The average age for women to have their first child is 26 years old. Birth control is very prevalent in Latvia, and women are in control of it. Popular forms of contraception include condoms, intrauterine devices (IUDs), and birth control pills. More Latvian women than men use contraception, and although contraception options are being used, abortions are also a form of family planning (Putzi 2008, 184). In fact, "in 1998, there were 108 abortions for every 100 births" (Putzi 2008, 184). While the maternal mortality rate in Latvia is lower than other former Soviet States, it is still much higher than Western Europe's rate.

The Latvian government is trying to increase the fertility rates of Latvian women through many different forms, including encouraging artificial fertilization and programs such as the Population of Latvia and People's Health, whose main goal is to "increase the birth rate" (Putzi 2008, 184).

Diseases and Disorders

The highest cause of death in Latvia is noninfectious diseases. These include cardiac and circulatory diseases. Among women, the mortality rate from these diseases was

795 per 100,000 women (EIGE 2016). Women also have high blood cholesterol levels, which can be an indicator as to why these diseases are so prevalent. Many Latvian women also have an unhealthy body weight, which can also lead to many diseases. Four percent of women are categorized as overweight, and 18.6 percent are obese.

HIV/AIDS is on the rise in Latvia. As of 2011, the rate of newly diagnosed infections was “13.4 per 100,000 population” (WHO 2013). Of the newly diagnosed, when gender was known, 65 percent were males, and about 50 percent of the cases where the transmission was known were “infected through heterosexual contact” (WHO 2013). Only about 1 percent of the cases were from mother-to-child transmission.

Among women, the “most common cause of death in malignant tumors . . . is breast and colorectal malignant tumors, followed by stomach and lung cancers” (EIGE 2016). Because of this, Latvia now offers public cancer screenings. This includes “a centrally organized cervical cancer preventive screening for women 25 to 70 years and preventive breast cancer screening for women 50 to 69 years” (EIGE 2016). Cervical cancer screenings occur every three years, and breast cancer screenings occur every two years.

Employment

Many Latvian women have jobs and careers and are protected by law from gender discrimination. According to Irina Novikova (1995), in 1989, women comprised “54.9 percent of the workforce” (Novikova 1995). While women are the majority in the workforce, they also make up the majority of the unemployment force, 63.2 percent of whom live in the capital of Latvia, Riga (Novikova 1995). Women have many different occupations, including nursing, teaching, “manufacturing, handicrafts, health care, public services, education, [and] cattle breeding” (Putzi 2008, 184). Although women do not make up the majority of managerial positions, there are a handful of successful women entrepreneurs whose companies are known worldwide.

The Labor Law “stipulates that everyone has an equal right to work” (EIGE 2016). This law also protects employees from harsh working conditions and provides a process for appealing unfair treatment in the workplace. With the Labor Law in place, there are no dress codes for women, and there are no banned professions. But this law does prohibit women “from working under hard and hazardous working conditions” and “stipulates that pregnant and

breast-feeding women, women with children under 3 years of age or handicapped children should not be involved in overtime or nighttime work” (Putzi 2008, 184).

There is a gendered pay gap in Latvia, where women earn 15–19 percent less than a man for the same job (EIGE 2016). Although, in service and administrative jobs, scientific and technical jobs, and state administrative jobs, women earn more than men. The job sector that has the worst pay gap is the financial sector, where women earn 63.1 percent less than their male counterparts. These pay gaps have gotten worse over time as well.

As women are the main caretakers of young children, women are more likely to stop their careers or put them on hold to take care of their families. They do this through “flexible working hours, aggregated working hours, flexible timetable, and telecommuting or remote work” (EIGE 2016). As there are not enough child care facilities in Latvia for children under three years old, women are sometimes forced to take these options for working, if their employers provide them.

The percent breakdown of women and their type of work is as follows:

91% of all employed women from 15 to 74 years of age are employees (compared with 86.2% of employed men), 2.6% are employers or merchant owners (compared with 5.3% of employed men), and about 0.7% are unpaid workers who are, e.g. helping family members in their businesses or farms, etc. (compared with more than 1% of employed men). (EIGE 2016)

The Advocates for Human Rights reported that a “survey examined twelve categories of work for nongovernmental organizations” and found that women are the majority of activists in health care, women’s issues, and the environment (Advocates for Human Rights 2010). Women are also involved in “education, youth, charity, recreation, politics, unions, democracy/human rights, ethnicity, and religion,” although men are the majority in the areas of democracy, human rights, ethnicity, and religion (Advocates for Human Rights 2010).

Family Life

Dating usually begins in high school for Latvian girls, and dates include clubs, discos, getting coffee, or going to a sporting game. The average age for marriage is 25 for women and 27 for men. The earliest age either gender

can get married is 18 years old, although with parental approval, women and men can get married as early as 16. It is also legal for a 16-year-old to marry someone who is older than 18. Divorce rates are increasing, “with more than 60 percent of marriages ending in divorce” (Putzi 2008, 184). The number of couples that live together but are not married is also increasing. Marriages are usually held in a church and vary between small, private events and large gatherings.

Marriage in Latvia is fair with respect to gender. Women can keep their surname if they wish and keep their properties and money separate from their husband or combine them in joint accounts. Both women and men “have equal parental authority over children during marriage,” and both can be considered the head of the household (OECD 2016).

The main job women have is still a tradition one. Women are expected to be “homemakers” and “maintain traditional family customs” (Putzi 2008, 184). According to the Social Institutions & Gender Index, women are more likely to do the bulk of the household work, such as domestic and care jobs (OECD 2016). Chores are also gender based, as daughters and young girls usually help with cooking and cleaning within the household.

LGBT Rights

According to the U.S. Embassy on Latvia’s website, “Latvia does not permit marriage between two same-sex individuals” (U.S. Embassy in Latvia). Within the judicial system, “there are no laws which provide any positive rights to LGBT people” (ILGA-Europe 2016). Their marriages are not recognized, and they cannot register their partnerships. The only protection LGBT people have, in respect to specific laws, is the labor law that protects discrimination based on sexual orientation in the workforce.

There is little data regarding Latvian people who identify as LGBT. The national census does not include that information, nor are there any research projects monitoring the issues. The LGBT population in Latvia is one where many of the people “live their lives hiding their sexual orientation and/or gender identity, which results in very few discrimination and hate crime cases being report[ed]” to the government (ILGA-Europe 2016).

While Latvia, as a country, allows free public speech, public demonstrations and pride marches celebrating LGBT and raising awareness are often pressured to be canceled by the Riga City Council. Latvian LGBT people are

still working toward recognition in laws and equality and the first gay pride march occurred in 2005 in Riga (Mole 2011).

Politics

The Latvian government is considered a parliamentary democracy. The organization of the Latvian government is as follows: The population of Latvia that is over the age of 18 votes for the members of parliament. The parliament members then vote for a president, who is in office for four years with the chance of reelection once, who then “selects a prime minister” (ProQuest 2012, 1–5). The prime minister’s duty is to form the government, many times with a cabinet of members chosen by the prime minister. These cabinet members have no fixed term. The prime minister’s concepts and structure is then voted on by parliament.

This parliament has 100 seats, and as of 2014, women occupy 18 of those seats. There were more than 1,000 candidates for the seats, of which one-third were women. The seats are held for terms of four years. These seats are voted on by the public of Latvia. To be a registered voter in Latvia, an individual must be at least 18 years old and a Latvian citizen. Overseas voters may still vote. There are many qualities that can disqualify a citizen from voting. As reported by the Inter-Parliamentary Union (IPU), these include “persons legally declared incapacitated; persons serving a court sentence in a penitentiary or having been criminally convicted; former employees of the USSR, Latvian Soviet Socialist Republic; or foreign state security, intelligence, or counter-intelligence services; persons active after January 13, 1991, in the Latvian Communist Party (CPSU), the Working People’s International Front of the Latvian SSR, the United Board of Working Bodies, the Organisation of War and Labour Veterans, and the All-Latvia Salvation Committee or its regional committees” (IPU 2016).

Even though Latvian women have a higher graduation rate than men, there are still more men in higher positions. According to the national report on the implementation of the Beijing Declaration and Platform of Action and the results of the 23rd Special Session of the General Assembly, there is a “pronounced dominance of one gender (male) proportion in economic decision making. Women are underrepresented in the higher levels of decision making” (EIGE 2016). Although, as of 2014, there is a female speaker of parliament, Ms. Inara Murniece. According to the Advocates for Human Rights, “women constitute

30–40 percent of the members of Latvian political parties” (Advocates for Human Rights 2010). While 18 women currently hold seats in the Latvian parliament, many times they are not “elected for positions related to finance or material resources and are often excluded from the main decision-making processes” (Advocates for Human Rights 2010).

In 1999, Latvia set an example and elected Vaira Vīķe-Freiberga to become the first female president of the country. The Advocates for Human Rights reported that 62 percent of the activists in Latvia are women who participate in “local organizational and grassroots activism” (Advocates for Human Rights 2010). According to Sibylla Putzi, many women are involved in the legal sector. Women account for 71 percent of the judges in the lower courts, “64 percent in regional courts, and 47 percent in the Supreme Court” (Putzi 2008).

Religious and Cultural Roles

The most popular religion in Latvia is Christianity. According to Sibylla Putzi (2015), the main types of Christianity found in Latvia include “Lutherans (55%), Roman Catholics (26%) and Eastern Orthodox (10%)” (Putzi 2015). Although many Latvians may have a religion they adhere to, because of the religious oppression that occurred in Latvia under the Soviet rule, many citizens “do not identify themselves with any particular church” (ProQuest 2012, 1–5). Now that Latvia has religious freedom, churches are reopening, and more people are starting to go to services. But “active involvement in spiritual functions and church services is infrequent” (Putzi 2015). Mostly, citizens who attend church tend to go on Easter and Christmas.

There is a small percentage of people in Latvia who adhere to “pre-Christian rites that focus on nature-based deities” (ProQuest 2012, 1–5). Women who believe in these deities are known to “make special offerings to *Mara* and *Lamia* for a normal delivery and a bright future for the child” (Putzi 2015).

In the Media

Media in Latvia are bound by law to “not incite hatred or invite discrimination against a person or group of persons on the grounds of sex, race or ethnic origin, nationality, religious affiliation or faith, disability, age or other circumstances” (EIGE 2016). Women hold more decision-making positions than men in the media sector, at 60 percent,

but they are not at the highest positions possible. At the highest-level jobs, men still have the majority, at 75 percent. Although women hold many positions in the media, that does not constitute gender equality in the media. According to the National report on the implementation of the Beijing Declaration and Platform of Action (1995) and the results of the 23rd Special Session of the General Assembly (2000), “stereotypical and sexualized reflections of the female image are still observed in media and the public space as a whole” (EIGE 2016). While studies have been done and the gender inequality has been seen, not much has been done to change it. The suggested course of action is to educate “media professionals and journalists promoting a greater understanding of gender equality issues and its importance in different areas of life” (EIGE 2016).

Issues

Sexual Harassment, Assault, and Rape

In 2012, the U.S. Department of State human rights report stated that “sexual harassment is rarely reported, due to stigma and the bureaucracy involved” (OECD 2016). In 2010, “a report by the Council of Europe . . . noted that at the time, there were no dedicated services for victims of rape and sexual assault” (OECD 2016). But in Latvia, sexual violence is defined as “sexual acts in physical contact with the victim, anal or oral penetration” (OECD 2016) included. These acts are criminal and punishable. Rape is a punishable “by a prison sentence of three to seven years” (Advocates for Human Rights 2010). In Latvia, the definition of rape is an “act of sexual intercourse by means of violence, threats, or taking advantage of the state of helplessness of a female victim” (Advocates for Human Rights 2010). If officials look only at the definition of rape, this means that males cannot be rape victims. Sexual harassment has no definition in Latvia law, but if reported, it “may be classified as another offense such as rape, threat of rape or offense against the person’s honor” (Advocates for Human Rights 2010).

Violence

Before 2013, “emotional, physical, sexual, and economic violence against a spouse or his or her child, or a child of both spouses” (EIGE 2016) was not specifically stated in the Latvian laws as a crime. Since then, it is “clearly mentioned in the Civil Law as a reason to request a divorce without observing a mandatory reconciliation period for

spouses” (EIGE 2016). In cases of stalking or other violence, Latvian laws have been amended to “provide the right of a person suffering from violence or stalking to ask a court on his or her own initiative” (EIGE 2016). The law was also changed to include aggravated circumstances when there is a “commitment of a criminal offense against morals, and sexual inviolability against a person to whom the perpetrator is related in the first or second degree of kinship, spouse or former spouse, or a person with whom the perpetrator has been in a domestic partnership” (EIGE 2016). The Advocates for Human Rights state that while violence against women is illegal, there is not specific law that states the punishments for committing violence (Advocates for Human Rights 2010).

Many women do not report domestic violence, as the societal belief in Latvia is that domestic issues should not be talked about in public. This was proved with a poll that showed that “15.8 percent of the respondents acknowledge violence against women in the family to be justifiable” (Marta 2016b). The same poll showed that about 50 percent (46.5%) of people would not intervene and stop a domestic abuse situation. When a rape is reported, Latvian government officials tend to blame the victims, which could be a reason as to why rapes are underreported in Latvia. Many times, victims of rape do not know or understand their rights and are poorly informed of them from officials. This is also the case with domestic abuse, as many Latvian women do not recognize their relationship as being abusive. Those that do recognize their abuse say they are dependent on the oppressor and would not be able to provide for their children or have a shelter otherwise. According to the Advocates for Human Rights, Latvia does not have any “dedicated shelters or hotlines for victims of domestic violence” (Advocates for Human Rights 2010), but this does not mean that the victims have no help. They can contact general hotlines or family crisis centers, such as Marta Center.

Trafficking

The *2015 Trafficking in Persons Report* created by the U.S. Department of State reports that the Latvian government is below the standards to exterminate trafficking, but efforts are being done to comply. As travel to and from Latvia has become easier, criminal human trafficking has been on the rise. Latvian women and children are not only recruited for human trafficking around Europe but within Latvia as well. According to the Advocates for Human

Rights, “women are trafficked from the country for commercial sexual exploitation and forced labor to the United Kingdom, Italy, Ireland, the Netherlands, Belgium, Denmark and Germany” (Advocates for Human Rights 2010). There are few reports of trafficking brought to the police in Latvia, so it is difficult to estimate the exact number of victims.

Human trafficking is defined as “the recruitment, conveyance, transfer, concealment or reception of persons for the purpose of exploitation” (Advocates for Human Rights 2010) and is punishable with 8 years in prison. This time could increase under different circumstances, such as trafficking minors or working with organized crime. The Advocates for Human Rights report that, in 2009, “34 trafficking investigations were initiated and 15 offenders were convicted” (Advocates for Human Rights 2010). Latvia is working to lower the amount of trafficking in the country through government-assisted programs that help victims return to their normal lives and pay for medical bills, shelter, and other care. Many victims help with the investigation processes and are not punished for crimes they committed because of being trafficked.

One of the service programs in Latvia that assists women dealing with domestic violence as well as human trafficking is Marta Center. Marta Center supplies toll-free hotlines that one can call to report human trafficking cases and to get the information needed before one decides to go abroad or leave the country. They also provide professional advice and services for women dealing with many different types of crisis problems. Marta Center reports that, in Latvia, people are being “trafficked for hard forced work abroad” (Marta 2016a) as well as women and children being shipped to new countries with the promise of a new life and then later “trafficked for sex slavery against their will” (Marta 2016a).

Lithuania

Overview of Country

Lithuania is one of the nine Baltic Sea countries. It is bordered by Latvia to the north, Belarus to the east, and Poland and Russia (Kaliningrad) to the southwest. Its origins go back to the late 13th century, when the Grand Duchy of Lithuania was established. In the late 14th century, Lithuania formed a dynastic union with Poland that continued until the late 18th century, when the Polish-Lithuanian Commonwealth was dissolved and most of the Lithuanian territory incorporated into the Russian Empire for some 120 years. In 1918, Lithuania reemerged as an independent parliamentary democracy with equal rights for men and women. In 1920, when women practiced their suffrage right in the first democratic parliament election, 5 women were elected among 120 representatives. In 1926, the first democratic era ended with a military coup d'état that established authoritarian rule until the Soviet occupation in 1940. After five decades of communist rule, Lithuania was reestablished as an independent state in 1990. The collapse of the Soviet Union marked the beginning of a great economic transformation and a society dominated by processes of marketization and democratization. In 2004, Lithuania became a member of the European Union (EU), joining its border-free Schengen Area in 2007. On January 1, 2015, it joined the eurozone, and the euro became its official currency.

Lithuania's 3 million inhabitants live within a territory of 25,000 square miles (65,000 sq. km), roughly the size of Ireland. Two-thirds live in urban areas; some 500,000 people live in Vilnius, the biggest city and the capital. Fifty-four percent of the population is female. The median age is 43 years for women and 38 for men. The life expectancy for women is 79.5 years and only 68.4 years for men. The number of elderly women is almost twice that of elderly men. Having reached a peak of 3.7 million at the beginning of the 1990s, the number of inhabitants has continued to decline. By January 2013, the population had shrunk by more than 700,000 people, and it is now at the same level as 1970. Emigration accounted for 83 percent of the population decline. Migration tends to be gender-balanced, with only slightly more men both departing and arriving; and it contributes to the increasing aging of society. From 2001 to 2012, 79 percent of all emigrants were under 40; one out of three was between 20 and 29 years old.

Remittances from Lithuanians living in other countries have become an important part of the national economy and amount to nearly 5 percent of the gross domestic product (GDP). During the last two decades, natural population change was likewise steadily negative; that is, the number of deaths exceeded the number of births. The total fertility rate, that used to be 2.6 in 1960 and 2.03 in 1990, dropped sharply in the early years of post-Soviet transformation to 1.55 in 1995. Reaching its lowest value of 1.2 in 2002, total fertility recovered to the level of 1.6 in 2012. Unemployment, decreased living standards, and poverty were among the reasons for this sudden decline that can be attributed to the socioeconomic transformation. Lifestyles and “cultures of postponement” regarding family formation and transitions to adulthood contributed to the persistence of low fertility rates (Reiter 2009, 239).

Although the census in 2011 counted 154 different ethnicities, Lithuania is ethnically rather homogeneous: 84 percent of all residents self-identify as Lithuanian, and the second-largest ethnic group is Polish (7%) (Statistics Lithuania 2013). During the Soviet period, unlike the two neighboring Baltic countries of Estonia and Latvia, Lithuania was sparsely populated with Russian speakers. The small Russian minority of 9 percent in 1989 had shrunk to 6 percent by 2011. Most of the immigrants to Lithuania (88% in 2012) are returning citizens. Only 3 percent came from other EU countries and 7 percent from former Soviet republics (excluding Latvia and Estonia) in 2012 (Statistics Lithuania 2013).

Lithuania is characterized by low religious diversity: 77 percent associate themselves with Roman Catholicism, 6 percent do not identify with any religious group, 4 percent are Orthodox, and only 0.1 percent are Muslim. As in other former communist countries, this high level of religious affiliation does not imply involvement in religious practice. Religion is important for only 19 percent; 13 percent pray once a day, and 12 percent attend weekly services (Pew Research Center 2009).

The status of women in society is framed by two historical breaks and transformations of gender relations in the 20th century. The first transformation followed the Soviet occupation at the beginning of the 1940s, when the Catholic conservative family model was shattered by the imposition of the gender ideology of the early Soviet period. Like men, women were obliged to work, but they also had to maintain the traditionally female family responsibilities. Within the frame of the Soviet gender order, women became working mothers, combining the roles of paid

workers; wives and partners; mother and single mothers; providers of care, health, and education; and participants in public life.

The second transformation of gender relations started after the collapse of the Soviet Union. Research suggests that this process of reform has been full of tensions between modernizing and traditionalizing forces, surrounded by the realities of neo-capitalism. For instance, early attempts to revive traditional gender relations promoting male breadwinning versus female housekeeping failed simply because of economic hardship. Women’s income from employment is indispensable, while they continue to be the primary homemakers and caregivers. It was ultimately the “reality of life [that] . . . helped to rid society of an idealization of the family unit which portrays the model of man-provider and woman-housewife” (Purvanekienė 1999, 123).

The principle of equal opportunities and equal treatment is enshrined in the Constitution of Lithuania; it is backed up by institutional structures and guidelines that regulate women’s issues. For instance, in 1998, Lithuania was among the first countries in Central and Eastern Europe to adopt a Law on Equal Opportunities between Women and Men. In 1999, the Office of the Equal Opportunities Ombudsman was established and is responsible for the supervision and implementation of this law together with the 2005 Law for Equal Treatment. From 2010 to 2014, the third National Women and Men Equal Opportunity Program, which was launched in 2003, was implemented.

In terms of fulfilling official criteria within Europe, Lithuania is regarded a good case study for implementing gender equality. This is reflected in the decision to locate the European Union’s Institute for Gender Equality in 2007 in Vilnius. However, many economic and social indicators underline that the actual situation of women and men in Lithuania is more complex and ambiguous. The UN Development Programme (UNDP) ranked Lithuania 37th out of 187 nations on the Gender Development Index. While 89 percent of women have at least some secondary education, they hold only 23 percent of parliamentary seats (UNDP 2014).

Girls and Teens

In a recent ranking of child well-being in 29 developed countries, Lithuania, one of the poorest on the list, is ranked near the bottom at 27th, right after the United

States. According to the five dimensions of the child well-being index, education is the domain where the country performs relatively best, at 19th place, compared to the other countries. Lithuania performs worst of all countries in health and risk behaviors (UNICEF 2013).

Although the legal age limit for purchasing tobacco (and alcohol) is 18, 44 percent of 15-year-old girls reported having smoked their first cigarette at the age of 13 or before. The international Health Behavior in School-aged Children (HBSC) average is 22 percent for girls. Twenty-one percent of 15-year-old girls (and 34% of boys) smoke regularly at least once a week. Compared to other countries, Lithuanian young people are among those with the earliest experience of alcohol consumption. For instance, 47 percent of girls aged 15 have been drunk at least twice. While this number is well below that of Lithuanian boys, with 57 percent, it is one of the highest rates internationally; the international average is 29 percent (UNDP 2014).

In terms of body image, the HBSC study finds that 39 percent of 15-year-old girls deem their bodies too fat, and 24 percent report weight-reduction behavior; researchers classify only 5 percent of girls as overweight or obese. Eleven percent of 15-year-old girls and 18 percent of boys report one hour of physical activity daily. Lithuanian girls are also comparatively prone to a sedentary lifestyle: 70 percent watch television for two or more hours daily. The HBSC average for girls of this age is 62 percent (UNDP 2014).

Health

The HBSC finds that 17 percent of girls and 23 percent of boys aged 15 report having been bullied at school in the past months; 16 percent of girls and 32 percent of boys report bullying others. These are among the highest levels of bullying experienced in Europe; in fact, the Lithuanian girls are the most bullied girls in Europe (Currie et al. 2012).

Since 2007, the Program of Family Preparation and Sexual Education is officially implemented at schools. However, many experts criticize education about family planning and reproductive health as inadequate and inappropriate for adolescents. The insufficient role of schools is confirmed. For example, in a survey of Lithuanian boys and girls aged 16–18, they did not identify schools and teachers among the sources of information on contraception and family planning: 77 percent indicate the Internet as a source of information, 56 percent the printed press, 51

percent friends, 35 percent parents, 13 percent gynecologists, and 6 percent the general practitioner (Denafaitė et al. 2010). In the HBSC study, 12 percent of 15-year-old girls reported having had sexual intercourse; 84 percent of girls reported condom use and 7 percent the use of contraceptive pills at the last intercourse (Currie et al. 2012).

Abortion

Abortion is legal until 12 weeks into the pregnancy. It used to be one of the main methods of birth control during socialism. The number of legally induced abortions has fallen dramatically, from 40,765 in 1991 to 6,033 in 2012—that is, 43.5 abortions per 1,000 women of childbearing age in 1991 to 8.5 in 2012 (Johnston's Archive 2017). The Lithuanian Parliament is deliberating a draft Law on the Protection of a Life in a Pre-natal Phase; following the example of the Polish abortion law in force since 1993, it would restrict abortion to cases of rape, incest, and danger to the life of the mother. The explanatory note to the bill underlines the leading parties' explicit interest in engineering fertility choices of women when it declares, among other things, that abortion is “one of the factors influencing the low morality level of society and the critical demographic situation.” Pro-choice activists argue that the ban will primarily affect unprivileged and vulnerable women, who are more likely to rely on abortion as a means of family control and are unable to afford legal abortions abroad.

In 2012, 655 abortions were registered among young women below age 20; six of them were younger than 15. The number of abortions among teenagers below age 20 declined by 50 percent, from 1,310 in 2002 to 655 in 2012; the decline was particularly steep after the year 2007 (1,215 abortions). Births among women under the age of 20 followed a similar trend: they decreased gradually from 2,773 in 2002 by 50 percent to 1,383 in 2012, with 2007–2008 appearing to be the turning point (Johnston's Archive 2017).

Education

Education is compulsory for children above the age of 7 and below the age of 16. After 12 years of comprehensive education, students can continue with higher education within the three-tier system (BA/MA/PhD) that corresponds to the EU standard. Most young people attend further education: in 2013, 92 percent of all young people aged 18 had attained upper secondary education. Having

completed upper secondary education corresponds to the societal norm—91 percent of the population aged 25–64 (UNICEF 2013).

The generally high level of education of the population is still increasing: the 21 percent share of the population aged 25–64 with higher education in 2005 increased to 31 percent in 2013. It is even higher among women: 40 percent of all women aged 25–64 have higher education (college or university). Furthermore, the majority of students are female: 59 percent at universities and 55 percent at colleges (UNICEF 2013).

The choice of disciplines is strongly gendered. Only 10 percent of all the women (and 41% of men) in tertiary education were enrolled in science and technology studies in 2013–2014. Social services (84%) and journalism and information studies (76%) have the highest, and computing (11%) and engineering and engineering trades (14%) the lowest shares of women. Environmental protection and physical science are the most gender-balanced disciplines with 58 percent and 43 percent of female BA students, respectively. Disciplines such as business and administration and law are also rather balanced in terms of gender, both with 61 percent of women enrolled in bachelor studies at the beginning of the 2013–2014 academic year, as well as mathematics and statistics with 62 percent female students and security services with 41 percent (UNICEF 2013).

The Program for International Assessment (PISA) that measures the performance of 15-year-old students in 65 countries ranks Lithuania 37th for mathematics, 39th for reading, and 30th for science. Estonia, a country with similar starting conditions in 1990, ranks 13th in reading, 17th in mathematics, and 9th in science. Like in most other countries, Lithuanian boys scored higher than girls in mathematics, and girls scored higher in reading. As in 15 other countries, the gender gap is in favor of girls regarding scientific literacy (NEC 2013).

Employment

Before the breakdown of the Soviet Union in 1990, Lithuania was characterized by full employment. According to the Soviet Constitution, both women and men had the duty and right to labor; unemployment as well as a labor market did not exist. This changed abruptly with the transition. Lithuania was hit by the rapid rise of unemployment to double-digit rates. Lithuania is now classified as a liberal economy with flexible labor markets, a minimalist welfare

state, low union density of some 10 percent, significant foreign ownership, and underdeveloped corporate structures.

With 11.3 percent in 2012, the unemployment rate of women is considerably lower than that of men (15.1%)—both are well above the 10.5 percent average of the European Union. Since 2005, the labor market participation of women increased from about two-thirds to 70 percent in 2012 (compared to 74% of men). Slightly more than half of the Lithuanian labor force is female (Eurostat 2017). The share of part-time work is low: about 11 percent among female employees and 7 percent among male employees. Some 60 percent of all part-time employment is female; the EU average is about 75 percent. Temporary employment is uncommon: less than 2 percent of female and 33 percent of male employees are in temporary contracts. These shares are the second lowest in Europe (after Romania), indicating that hiring and firing is generally easy in Lithuania (Eurostat 2017).

The Lithuanian labor market is strongly gender segregated. Thirty-eight percent of women and only 20 percent of men are employed in the public sector. Correspondingly, the share of self-employed women is lower than that of men. The highest shares of female employees can be found in human health and social work activities (87%), education (79%), and in the low-paid accommodation and food service activities (78%). Only 39 percent of managers are female, while 72 percent of the “professionals” and more than half of the “elementary occupations” are women (Eurostat 2017).

Differences in employment are reflected in earnings. In 2010, the average gross monthly earnings of women ranged from 1,065 litas (USD\$427) in accommodation and food services to 3,128 litas (USD\$1,253) in financial and insurance activities; the average male earnings in these two areas were 1,292 litas (USD\$518) and 5,333 litas (USD\$2,136). The gender pay gap amounts to 14 percent in the public sector and 19 percent in the private sector; it peaks at 44 percent in financial and insurance activities. The discrimination against women in terms of income persists across all levels of education. The average gross monthly earnings of women with higher education amount to less than 80 percent of that of men (Eurostat 2017).

Maternity protection has high political priority because, as two analysts maintain, “the low fertility rate in Lithuania is regarded as a threat to the national security” (Brazienė and Purvaneckienė 2013). According to EU standards, maternity leave is 18 weeks, 70 days before and 56 days

after childbirth. It covers 100 percent of previous net earnings up to a ceiling of 3.2 times the average insured monthly income (in April 2013, 4,761 litas, or USD\$1,890) and is funded by the Social Insurance Fund. Fathers are entitled to one month of paternity leave after childbirth.

Parental leave is possible until the child is three years old; payment is limited to 100 percent of net earnings until the child is 12 months old, or to 70 percent until the child is 24 months old. Employees with a child under age 14 can take up to two weeks of unpaid leave per year per child. In addition, pregnancy, birth, and housing grants are available. In 2011, 20,000 mothers and fathers received benefits for paternal leave during the child's first year and 24,000 for the second year; only about one-third of fathers made use of paternity leave (Brazienė and Purvanekienė 2013).

Family Life

While women continue to play an active role as mothers, homemakers, and employees, Lithuanian society is experiencing important changes in family structures, as a few basic statistics indicate. From 1990 to 2012, the number of registered marriages per 1,000 population dropped from 10 to 7. In 2012, an average of 50 divorces per 100 marriages was counted, and 29 percent of all newborns were born out of wedlock (the EU average is 40%)—80 percent of them were registered by unmarried couples and 20 percent by the mother alone (Eurostat 2016).

With the traditional family model in decline, alternative family arrangements are spreading. For example, EU labor emigration facilitates the emergence of alternative family arrangements, such as families with parents abroad where children are left behind without appointed guardians or with nontraditional guardians. With European integration progressing, society also anticipates same-sex couples to enter the domain of family relationships. Currently, same-sex marriages or partnerships are not legal. According to a survey in 2013, 79 percent of respondents oppose same-sex marriages, and 36 percent oppose the registration of same-sex partnerships (Vakarų ekspresas 2014).

The struggle for or against more progressive notions of family is reflected in politics. In 2008, the Lithuanian Parliament adopted the State Concept of Family Policy, which defined family exclusively as a marriage-based arrangement of a union between a man and a woman. Single parents, in 98 percent of cases women, were excluded by this definition. The concept caused controversy, with opponents arguing that it discriminated against children

in nonmarried families and reinforced social exclusion and risk behavior of vulnerable women, as it would, for instance, discourage them from ending marriages despite domestic violence. In 2011, the Constitutional Court ruled that the State Concept of Family Policy contradicted the Constitution and concluded that the concept of family cannot be derived solely from the institution of marriage. Following the ruling, the constitutional amendment was initiated by the Parliament.

Soviet family policy had supported a dual-earning family model and provided extensive child care before primary education: in 1990, 163,000 children attended one of 1,681 preschool establishments (urban 813, rural 868). This changed dramatically with the transformation of the country. In 2012, 105,000 children attended 660 preschool establishments (urban 547, rural 113). Especially in rural areas, employed parents have to rely on informal child care and family networks: less than 30 percent of children 1–6 years are in organizations of preschool or preprimary education and care (compared to 80% in urban areas). Of grandparents aged 40–64, 37 percent assume child care responsibilities for their grandchildren once a week or more; 46 percent of them combine grandparenting with employment. Grandmothers are more likely to participate in child care (Kraniauskienė and Gedvilaitė-Kordušienė 2012).

Politics

The democratic participation of women goes back to 1918, when Lithuania was one of the first countries in Europe to grant full political rights to women. In the presidential elections of 2009, the first female president was elected by almost 70 percent of the voters. In the same year, the first female chair of Parliament was appointed. Despite these two important positions, women remain underrepresented in the political sphere, especially in the Lithuanian Parliament, in municipal councils, and among the delegates to the European Parliament.

To date, the female prime minister of the very first Lithuanian government after the Soviet occupation was the last woman in this position. The number of women in all Lithuanian governments since 1990 was between 1 and 3 out of 10–19 ministers. The current 16th government includes 1 woman among its 14 ministers. In 2012, 75 percent of civil servants were female. However, more than two-thirds of managerial positions are taken by men.

In the Soviet period, the representation of women in the Supreme Soviet was guaranteed by quota. A general quota

A Snapshot of LGBT Rights in Lithuania

The evolution and place of rights for lesbian, gay, bisexual, and transgender (LGBT) persons in Lithuania is contentious, driven by a complex mixture of domestic and international pressures. Upon regaining independence following the collapse of the Soviet Union, discussion and awareness of nontraditional sexualities was at best a marginal topic. Like the larger Baltic region under communism, male homosexuality was illegal, considered a decadent and unnatural import from the West. The Lithuanian Catholic Church, which has widespread popular support and legitimacy from its role as a major player in the struggle for independence, continues to espouse traditional family values. This has helped cement public attitudes against LGBT rights.

Accession negotiations, and later membership in the European Union (EU) has challenged Lithuania's historic conservatism to LGBT rights. As a condition of entry into the EU, the country was required to pass legislation that protects LGBT persons from some forms of discrimination. Growing support for LGBT rights from the EU, including state-recognition of same-sex partnerships, has also provided Lithuanian LGBT activists an increasingly substantial and well-developed platform to organize and articulate demands for increased legal and social acceptance.

However, many Lithuanian elected officials have been reluctant to support LGBT rights—and many continue to be hostile. In a ranking of European states, Lithuania continues to rank near the bottom of countries in their acceptance of LGBT persons and offers few legal protections (ILGA-Europe 2016). Moreover, there have been several attempts to introduce anti-gay propaganda legislation, similar to laws adopted in nearby Russia. Ongoing political resistance to LGBT persons and their rights stems from a number of factors, including pressure from Russia, frustration with perceived EU intervention in domestic affairs, and a deeply fractured political system that incentivizes the presence of populist campaigns that ostracize LGBT persons under the guise of protecting Lithuanian identity.

—Michael Pelz

system for elections or positions in public administration no longer exists. The Lithuanian Social Democratic Party is the only party that introduced a gender quota. According to its statute, in all elected bodies and among the nominated election candidates, either gender may not exceed 60 percent. With the first democratic elections in 1990, only 9 percent of female delegates entered the Lithuanian Parliament. Over the years, this share increased to 23 percent, or 33 female members of Parliament, after the elections of 2012. At the municipal level, women hold about 10 percent of the positions as mayors. One reason for the low political representation of women, for instance in Parliament, could be the prevailing view that women do not attract voters.

In terms of civic political participation, a database of women's nongovernmental organizations (NGOs) compiled by the Women's Issues Information Centre currently refers to 77 women's NGOs working nationwide and locally.

The level of sensitivity for gender-based discrimination in Lithuania is rather low compared to other EU countries. For instance, a survey focusing on discrimination found that only 25 percent of Lithuanians thought that it was widespread (European Commission 2012). There is little acknowledgment of the many obstacles for women. Forty-eight percent of Lithuanian respondents indicate that women face significant problems in achieving positions of responsibility with public administration, 53 percent acknowledge obstacles for women trying to make a career in big companies, and 45 percent see challenges within political parties (European Commission 2011).

Religious and Cultural Roles

Attitudes regarding the role of women are still mostly traditional. A majority of Lithuanians prefer the dual-earner family model, with women increasingly combining family and work roles. Survey data from 2009 indicate that 72 percent of female and 59 percent of male Lithuanians agree that a woman's life is only complete when she has children. Yet, the support for combining family and work is similarly high: 71 percent of women and 57 percent of men agree, "A woman herself, and her family, will be happier if she worked." Men predominantly associate themselves with the sphere of work; only 15 percent indicate that they would choose to stay at home if they did not need to work. More than half of women would like to work, and 39 percent would be willing to dedicate themselves to family if they did not need to work. One-third of men would like to be sole breadwinners with wives out of work; yet,

only 20 percent of women want to be housewives (4% among university-educated women).

According to their self-understanding, both women and men see themselves as equally sharing responsibility for family decisions regarding, for instance, family budget or conflict resolution. Forty-five percent of men and 54 percent of women indicate that the work of both partners is equally important, but as many as 44 percent of men and 33 percent of women consider the husband's work more important. In practice, gender equality is not realized. For instance, both sexes consider women responsible for household tasks: more than 85 percent of women do laundry and ironing, about 80 percent are responsible for cooking, and about 70 percent are responsible for cleaning and washing up. Women are also likely to be the main caregivers for children and tend to be responsible for their food and clothes. Men typically contribute to shopping for daily commodities and tend to participate more actively in playing with children (Purvanekienė 2009).

The debate about female surnames is indicative of the power of tradition. Lithuanian female surnames reflect the woman's status as somebody's daughter or wife. For instance, an unmarried woman would be called "Paulauskaitė," a married woman or widow "Paulauskienė." This phenomenon that endings of surnames change upon marriage has once been labeled a "linguistic chastity belt" (Sabaliauskaitė 2009). After the issue was first raised by individual prominent women in 1998, it took until 2003 to recognize the traditional ways of naming women as a source of discrimination. Since then, women can opt for an alternative that still signals their gender but not their marital status. Only a few women make use of this option, and few parents give these names to their newborns. Women and families have opted for this surname version 3,500 times since 2003. The opposition to neutral names is still strong in society. For example, in 2009, a group of intellectuals referred to the 2003 decision as a "mistake." They demanded that only the traditional endings should be allowed, arguing, "They indicate belonging to a family, symbolize loyalty, close relations between spouses. Only immoral, disgraced women [are] called in contempt nicknames without these suffixes" (Digrytė 2009).

Issues

Domestic and Gender-Based Violence

Lithuanians consistently stand out among Europeans displaying the highest levels of awareness of cases of violence in such settings as family and friends, neighborhood,

and work or study. For example, 48 percent of Lithuanians know of a female victim of domestic violence within their circle of friends and family. This by far the highest rate measured in the survey and may be indicative of high levels of actual violence, but it also may point to a strong awareness in the population. Asked to assess the seriousness of various offenses against women, only 64 percent of Lithuanians describe sexual domestic violence as "very serious"; this share is 71 percent regarding physical domestic violence and 57 percent psychological violence (European Commission 2010). These shares are low compared to other EU countries and indicate a rather high tolerance against major offenses that mainly affect women.

Thirty-five percent of Lithuanian women (55% in the EU) have experienced sexual harassment since the age of 15 (Goodey 2014). Sexual harassment is a problem that Lithuanian "society is generally keen to ignore" (Davulis 2012, 174). Related legislation outside criminal law, such as the Equal Opportunities Act for Women and Men, was first passed in 1998 and caused a lot of heated media attention.

Thirty-one percent of Lithuanian women, compared to 33 percent in the European Union, have experienced physical or sexual violence since the age of 15, 24 percent experienced physical and sexual violence by a partner, and 16 percent by a nonpartner. During the relationship, 51 percent experienced psychological violence (Goodey 2014). In December 2011, the Law on Protection against Domestic Violence entered into force; it requires police to investigate reports of domestic violence, even if the victim does not press charges. In 2013, Lithuanian police registered 21,615 calls about domestic violence; about half of them were further investigated. In most of the cases, women are the victims of violence. In 2013, 8,322 women, 1,128 men and 739 children were registered as victims.

In 2013, 133 cases of rape and attempted rape were officially registered. After a peak in the period between 2003 and 2006, the absolute numbers of rape and attempts of rape have generally been in decline since 2010. However, the official rape statistics are criticized as inadequate. For instance, hardly any cases of rape or sexual abuse in the family are registered. The reason, it is argued, is the entrenched myth in society that "there is no forced intercourse in private family relations, and the woman has to obey the will of his partner" (LR Vyriausybė 2006).

Prostitution is illegal. It is a criminal offense when a minor is solicited for purposes of prostitution; minor prostitutes themselves are not subject to prosecution. The case of "the youngest prostitute," a 14-year-old girl, was covered

in the media (Zubrickienė 2001). According to experts, even younger girls work as prostitutes. When adults are involved, both client and prostitute can be fined for an administrative offense. Typically, however, the prostitutes are fined, and clients are not. For example, in 2013, 294 individuals were fined for prostitution and only 12 clients. This situation is one of the reasons fueling debates about changing the legislation and transferring the responsibility to the client.

Trafficking

Like other former communist societies, Lithuania became a source of human trafficking as well as a destination and transit country. Human trafficking is a criminal offense, as is forced labor. Trafficking is strongly associated with sexual exploitation of women. For many years, however, the problem remained broadly unacknowledged. An example is the 2005 scandal of bogus modeling agencies. When one of the country's most famous models argued that there were only five "real" model agencies in the country, journalists managed to identify over 30 modeling agencies operating in various cities of the country in a few minutes of online research (Mogučaja 2005). The first governmental program for Human Trafficking Prevention and Control was launched in 2002. The program then acknowledged that society believes that "women who are the victims of forced prostitution are themselves to blame for their misery" (LR Vyriausybė 2002).

In 2013, 47 pretrial investigations on human trafficking were being conducted. Most of the cases were related to trafficking young women abroad for sexual exploitation; others involved forced labor, pornography, and online ads. The government implements a program offering social assistance and reintegration to victims of trafficking and forced prostitution. Critics argue that the five NGO projects funded with 150,000 litas (USD\$59,000) in 2013 are inadequate.

M

Malta

Overview of Country

The Maltese archipelago lies in the middle of the Mediterranean, where east meets west and north meets south. It has had a long history of colonialism due to this politically strategic position. It is an island group, with resultant insularity. Malta is extremely small in comparison to other European countries and has one of the highest population densities in the world. It is strongly Catholic and displays strong primacy of the “family.”

The Republic of Malta consists of three inhabited islands—Malta, Gozo, and Comino—and two uninhabited islets. The total area is 316 square kilometers. According to the “Demographic Review 2005–2012” (NSO 2015a), the Maltese population stood at 421,364 in 2012, which could be broken down into 209,880 males and 211,484 females (NSO 2015a). In this year, 5.3 percent of the population were non-Maltese nationals, and the vast majority of these were male. Recent trends in migration demonstrate that Malta has become an immigration destination. In 2012, emigration mounted to 4,000, while immigration was up to 7,111 (NSO 2015a). Immigrants tend to be British expatriates, Southern and Eastern Europeans, and undocumented migrants arriving by boat. Life expectancy for the Maltese stood at 78.6 years for males and 83 for females in the same year.

The largest island is Malta, at 95 square miles (246 sq. km), with a population of just under 390,000 (NSO 2015a). It is the cultural, administrative, industrial, and commercial center of the island group. The next biggest island is Gozo, with a population of just under 31,500 on 26 square miles (67 sq. km). The longest distance in Malta, northeast to southwest, is about 17 miles (27 km), and the greatest width is not quite 10 miles (15 km). The population density is one of the highest in the world and 10 times as high as the European Union (EU) average. It is also one of the smallest EU member states.

Notwithstanding its relative barrenness and lack of natural resources, Malta has been coveted by various powers due to its position in the middle of the Mediterranean Sea. It has been a sensitive meeting place of cultures, religions, and empires (Sultana and Baldacchino 1994). The Maltese archipelago lies 50 miles (80 km) south of Sicily, 174 miles (280 km) east of Tunisia, 207 miles (333 km) north of Libya, and about equidistant from the Straits of Gibraltar and Alexandria, Egypt.

It has been fought over and ruled by the Phoenicians, the Romans, the Byzantines, the Arabs, the Normans, the various royal houses of Spain (which “gave” the Islands to the Knights of the Order of St. John), the French, and finally the British (Sultana and Baldacchino 1994). For almost 500 years prior to independence (1964), there were two major “rulers”: the Knights of the Order of St John (often referred to as the Knights of Malta, between 1530

and 1798) and the British (1800–1964). Their presence in Malta is still felt in the architecture, food, language, politics, and way of life adopted by the Maltese.

An effect of colonialism is the strong position of the Roman Catholic Church in Malta. Its presence traces to St. Paul's shipwreck in 60 CE, but it was during the period when Malta was administered by the Knights of St. John, which was a religious order, that the powers and privileges of the church in Malta became well-established and then proliferated. The Catholic Church in Malta had 250 years to grow in wealth, importance, and power. When the British took over, they were interested in the national affairs and left religious affairs to the church. This further consolidated the church's influence over the people, enabling it to become established as an important referent in practically all social issues, including secular events not falling within the national ambit (Sultana and Baldacchino 1994). As a result, the Catholic Church in Malta also developed a close and protective relationship with the people and often acted as their spokesperson through the ages. Fox (1991) notes that it was long the guardian of morals, manners, and learning in Malta, a position that occasionally brought it into conflict with the British and then Maltese governments. It was possibly the Catholic Church that gave Malta its identity and constructed much of its culture, such that the boundary between the religious and the social is often unclear (Tabone 1994).

In the early 2000s, the influence of the church was much reduced; however, it is still a powerful and influential force, and it remains a potent social agent. Abela (1996) found in a study conducted in the 1990s that Maltese society, when compared to other European societies, retained its traditionality and religiosity. He also found that the practice of religion was stronger in Malta than in other European countries. The self-reported importance attached to religion was substantially higher in Malta, as stated in another study by Abela (2000, 49).

However, no reliable statistics regarding religious belief are available. The U.S. Department of State estimates that 95 percent are Roman Catholic and the rest are Muslim (around 6,000), Jews (120), Coptic Christians, Greek Orthodox, Baptists, Evangelicals, Jehovah's Witnesses, Unification Church followers, the Church of Jesus Christ of Latter-day Saints, Seventh-day Adventists, Zen Buddhists, Bahais, and indigenous African religions worshippers, among others (U.S. Department of State 2014). Discern (2006, 14) found through a census conducted in 2005 that only 52.6 percent of the Maltese population attends Sunday mass.

Church schools, run by nuns, priests, and ecclesiastics, also educate a substantial proportion (one-third) of the Maltese population from kindergarten to preuniversity level (Baldacchino 2002). In fact, access to church schools is very keenly contested because they are popularly considered to provide a better education than state schools and are cheaper than independent schools. Those who attend church schools are groomed within a religious ethos that inculcates an ongoing intergenerational loyalty to an often unquestioned hegemonic dominance of the Catholic establishment in contemporary Maltese social life (Sultana and Baldacchino 1994, 13). A good proportion of people who attend these schools tend to end up in positions of power. Abela (2000, 177) further found that the Maltese, unlike their European counterparts, were more likely to agree that "it would be better if more people with strong religious beliefs held public office," and quite a few others agree or strongly agree that "politicians who do not believe in God are unfit for public office."

Notwithstanding some prevailing sexist attitudes within the general population, the legal structures have been changing since 1947—when Maltese women won the right to vote—to acknowledge and enhance the equal status of women. Since the mid-1960s, the "breadwinner's wage" was abolished, the public sector removed its ban on the employment of married women in 1981, and a government commission and secretariat (which was later given the higher status of department) were set up to work on addressing gender issues. In 1991, amendments to the Constitution were passed that allowed redress against discrimination based on sex and further allowed for the possibility of special temporary measures to be introduced, which are aimed at accelerating the *de facto* equality between the sexes. This was followed two years later with amendments to the Family Law, which gave men and women equal rights and responsibilities in marriage and legalized the joint administration of property acquired after marriage.

In 2004, the above-mentioned commission and department were incorporated into the newly set up National Commission for the Promotion of Equality for Men and Women as a result of the Equality for Men and Women Act (2003). This commission identifies and monitors national policies with a view to preventing and addressing discrimination and promoting gender equality. The Employment and Industrial Relations Act (2003) also clearly lays out the illegality of harassment on the grounds of gender and introduces and regulates conditions of employment that

are “family friendly.” In 2006, the Domestic Violence Act came into force, setting up the Commission on Domestic Violence, and in 2011, divorce was finally introduced. The Council of Europe Convention on Preventing and Combating Violence against Women and Domestic Violence (the Istanbul Convention) was ratified by Malta in 2014.

Girls and Teens

From Preschool Child Care to Secondary School

There are state-run, church-run, and private child care centers for children aged between three months and three years. Child care is free for working parents and parents enrolled in education. These centers open from Monday to Friday, 8:00 a.m. to 5:00 p.m., mirroring the work week. The staff at these centers are fully qualified, and the centers are governed by the rules, regulations, and principles established by Malta’s Department for Social Welfare Standards.

Following preschool, kindergarten for children aged 3–5 years is available but not compulsory. However, many parents opt to send their children to school early.

In primary school, girls and boys begin 11 years of compulsory schooling at the age of 5 and complete the cycle by the age of 16. State-run primary schools have been mixed-sex since 1980, and many private establishments now accept both boys and girls, although church-run primary schools still tend to be single-sex. By the end of year 6 (age 11), that is, the end of primary school, children take a benchmark

examination to assess their academic abilities and progress and then move on to a middle school (secondary school), usually in the vicinity of their home, or they may travel to a private or church school.

Secondary education is compulsory from the ages of 11–16 (forms 1–5). Some state middle schools recently became coed. At the end of this five-year period, girls and boys sit for the Secondary Education Certificate (SEC) examinations in English, Maltese, mathematics, a science subject, and a modern language. They can take as many other examinations as they wish. SECs replaced the British-modeled GCE O-Levels in 1994. At this point, compulsory education ends, but students may continue their education and attend a sixth form or college (post-secondary school), where they can take a range of academic or vocational courses. At this stage, those wishing to attend university generally study for MATSEC A-Level examinations—and young women and men must pass two A-Levels and four intermediate-level subjects to be considered for a place at the University of Malta.

Vocational and professional courses are also available at a variety of colleges, such as the Malta College of Arts, Science and Technology (MCAST) or the Institute for Tourism Studies (ITS), and there are also a number of private higher and further education institutions (Angloinfo 2014).

The University of Malta is the highest educational institution in the country, and it offers undergraduate bachelor’s degrees, postgraduate master’s degrees, and postgraduate doctorates. Female graduates have outnumbered male counterparts since 1997 in Malta (Hausmann, Tyson, and Zahidi 2010). In fact, the population aged 30–34 years with a tertiary level of education stood at 23 percent per 1,000 for males and 31 percent per 1,000 for females in 2014 (Eurostat 2015b). A majority of female graduates (60% of all graduates) are concentrated in gender-specific areas, such as education, health-related studies, and the arts. Female students pursue studies in humanities, health, and care-related subjects, while male students are more visible in scientific and technical courses.

Health

Access to Health Care

The World Health Organization (WHO) ranks the Maltese health system 5th on a global basis, an optimal position when one compares the ranking health systems in developed countries such as Sweden (23rd), the United

Kingdom (26th), and United States (37th) (Taylor and Blackstone 2012). Maltese people have free access to public health care, but they can also opt to utilize services found in the private health care sector. There are two general hospitals found in the Maltese Islands: Mater Dei Hospital in Malta and the Gozo General Hospital in Gozo (Malta.com 2016).

The public health care in Malta is funded from taxation. Free health care entails free treatment, including hospitalization, prescriptions, surgery, rehabilitation, pregnancy, and childbirth (Government of Malta 2016a). Primary health care is available through eight health centers (WHO 2015b) located in different areas of Malta; seven are found in Malta and another in Gozo. Clients can access the services provided by general practitioners and nurses. Preventive, curative, and rehabilitative services are also available. These include immunization, speech therapy, antenatal and postnatal clinics, well baby and pediatric clinics, and clinics for diabetes, orthopedics, and wounds.

The total expenditure on health in 2012 amounted to 8.7 percent of the gross domestic product (GDP). The Maltese government paid for 65.6 percent of the total expenditure on health in 2012, while the private sector funded 34.4 percent (WHO 2015b, 130). Other statistics provided by the WHO (2015b, 118) demonstrate that there were 34.9 physicians, 74.9 nursing and midwifery personnel, 4.7 dentistry personnel, and 11.2 pharmaceutical personnel per 100,000 population in 2013.

Maternal Health

The maternal mortality ratio in Malta stood at 9 women per 100,000 live births in 2013 (WHO 2015b, 66). However, additional data provided demonstrates that between 2000 and 2012, 4 maternal deaths were registered (WHO 2014). This low maternal mortality rate might be due to the majority of births being assisted by skilled health professionals (WHO et al. 2015, 4). Mothers were also provided with extensive antenatal care coverage after childbirth (WHO 2015b, 32).

Diseases and Disorders

Statistics provided by the WHO (2015b, 48) estimate that, at birth, the life expectancy of Maltese men and women in 2013 were 79 and 82 years, respectively. The probability of dying between ages 30 and 70 years from the main four noncommunicable diseases in 2012 stood at 12 percent.

Table 2 Mortality in Malta in 2012, by Gender

Noncommunicable Disease	Female	Male
Probability (% of all NCDs) of dying between ages 30 and 70 from cardiovascular diseases, chronic respiratory diseases, cancers, and diabetes	12%	
Total NCD deaths	1300	1400
NCD deaths under age 70	24	35
Age-standardized mortality rate by cause (per 100,000 population)	306.7	434.8
Cancer deaths per 100,000 population	103.8	141.7
Diabetes deaths per 100,000 population	7.6	11.3
Chronic respiratory diseases deaths per 100,000 population	9.4	23.6
Cardiovascular diseases deaths per 100,000 population	124.8	184.0

Source: WHO 2015a.

Men (30%) were more likely than women (20%) to die before age 70 from cancer, diabetes, chronic respiratory disease, or cardiovascular disease.

Men and women die from different causes (NSO 2015a, 60–66). In 2013, men were more likely to die from neoplasms, diseases of the respiratory system, or accidents. Women were more likely to die from mental and behavioral disorders, diseases of the circulatory system, or diseases of the genitourinary system during the same time period.

Employment

Malta has one of the lowest employment rates in the European Union and the lowest employment rate where female workers are concerned (Laiviera 2013). Tax breaks, national insurance concessions, and free child care were introduced to facilitate the entry and retention of women in the Maltese labor market (Ministry for Finance 2015).

As we have seen, notwithstanding several public measures having been taken since about 1960 to improve the situation with regard to gender mainstreaming, the responsibility for the care and well-being of children (as well as elderly and other relatives with support needs) still tends to be taken on by women, who as a result leave the labor market or do not join it in the first place. Abela's

Table 3 Causes of Death in 2013 by Gender

(2000, 109) study confirms that gender stereotypes on the respective roles of women and men, however much challenged, seem to still be alive in Maltese society. The dominant discourse in Malta, strongly influenced by its specific brand of Catholicism, would “allow” women to leave the home to seek paid employment mainly if it is financially necessary to do so and on the condition that the children’s well-being is not affected. Public comments have been made on women going out to work and neglecting family responsibilities to be able to afford “luxuries” as opposed to “necessities.” “Mother-blaming” when things go wrong, especially where the mother is in paid employment, is also still quite common within the general public.

Rizzo (2006) underlines that the male breadwinner model is gradually being replaced by the male breadwinner/female part-time homemaker. Although, as stated above, the number of female graduates has surpassed that

of males (Cutajar 2009), Malta has the highest Glass Ceiling Index in the European Union. European Commission data (Vella 2014) demonstrates that Malta had the least number of women on company boards in 2013. It is one of the countries where the share of female members of parliament (MPs) fell over time. This country has never had a female as a minister for finance or economy, while only a few women become judges.

Maltese women also tend to be segregated in certain occupational sectors, namely, in public administration, defense, education, human health, and social work activities. Men are more likely to find employment in wholesale and retail trade, transport and storage, accommodation, and food services. The National Statistics Office (2015b) demonstrates that women are paid less than men for doing the same job. A National Commission for the Promotion of Equality (NCPE 2012) study maintained that, in 2010, female legislators, senior officials, and managers earned 15 percent less than their male counterparts, with female clerks receiving 13 percent less, service workers and those working in retail and sales earning 18 percent less, and female professionals 14 percent less pay. The largest difference in pay was noted among female and male workers within elementary occupations.

Analyzing Inactivity from a Gender Perspective

The need to make ends meet is pushing more women with caring responsibilities to remain in or to reenter the formal labor market. The rate of inactivity among women in Malta is still high. While the Maltese male employment rate in 2014 was 74.9 percent, it was 49.3 percent for females (Eurostat 2015a). Malta therefore has a negative female employment gap of around 19 percent when compared with the European female employment rate. Highly qualified women are more likely to be in paid employment, even when compared to men. In fact, the younger female cohort (those aged 25–44), especially the women with a higher standard of education, were more likely to be active when compared to women aged 44 and more according to the 2015 National Statistics Office labor force survey (NSO 2015c).

Inactivity might also be due to cultural mores, economic climate, working conditions, religion, politics, or social infrastructure, among others. Other factors noted by a NCPE study mention age discrimination, lack of work experience, lack of qualifications, and transport factors. These push some women to work within the informal

economy. A study conducted by the Employment and Training Corporation (ETC 2007) found that younger women were more interested in finding employment, and making ends meet was the most important reason for wanting to work.

The Maltese public sector tends to offer more generous family-friendly measures than the private sector (NCPE 2012). These include 12 months of unpaid parental leave (4 months in the private sector), and a 5-year career break (not available in private sector). Public-sector employees with children 12 years old and younger can also avail themselves of reduced hours and telework—options which depend on the discretion of the employer in the private sector.

Malta has the lowest unadjusted gender pay gap in the European Union. This might be because the majority of Maltese women withdraw from the labor market when faced with family responsibilities. Research shows that if women remained within the labor market longer, the gender pay gap would widen. This is because men and women initially start with the same wages, but eventually the wages change over time, resulting in women earning lower wages for the same job. Pay gap is higher among people in nonstandard jobs, and Maltese women are more likely to be working in this sector. Their truncated work history coupled with nonstandard work results in lower chances of promotion. Gender pay gap is attributable to vertical and horizontal segregation emanating from gendered role expectations.

Family Life

One of the effects often attributed to the church is the strong emphasis on “family” and “family values.” Abela (1994a) points out that Malta has remained one of the most family-oriented countries in Europe, with the family still being very much at the heart of their personal and social lives. He claims that the durability of the family in Malta is impressive: “Irrespective of strong secularizing western European tendencies that impinge on Maltese culture, family values have, in the main, retained their traditional character” (1).

This argument was affirmed by Tabone, who stated that although the Maltese family had “changed its attire according to present trends, it fundamentally remains what it was” (1995, 39). He goes on to describe the Maltese family as a “modified extended family.” While parents and their married children with their offspring no longer live under

the same roof, the unity in the nuclear family extends to the family of origin—parents, brothers and sisters, and in-laws. The strong relationship that they sustain is similar to the extended family, which is made feasible by the small size of the island. In fact, the lack of distance can be said to not only be physical but psychological as well. The nuclear family receives support from the extended family, especially the family of origin, with parents continuing to show interest and concern toward their married children and their families, and vice versa. The down side of this is that sometimes this interest can become a form of interference (Tabone 1995). They impose sanctions on each other and exert influence and social control on each other to protect the family honor.

Notwithstanding, the Maltese family has undergone some obvious changes, the main one being that families today are generally smaller. This means that there are fewer years spent in child-rearing, although the children are still considered a “family value” and the fulcrum of the family (Tabone 1994). Fewer childbearing and child-rearing years theoretically free women up for the labor market.

It is important to keep in mind that, traditionally, as Tabone (1995) notes, married women working outside the home were considered as creating a threat to family stability in terms of marriage fidelity and the overall welfare of the family, particularly regarding small children. He found that this general attitude could still be said to be strong in 1995 (61.4% hold it strongly), though it is declining (79.8% in 1983). Abela (2000, 67) confirmed part of this by stating that Maltese men and women hold stronger views on traditional motherhood than their European counterparts. Thus, in Malta, many men, though fewer women, held that being a housewife is just as fulfilling as working for pay and that preschool children are likely to suffer if their mothers go out to work. The implication is that if the woman works in paid employment, the domestic sphere is going to be neglected because it is the woman who often still bears sole responsibility for it. He further added that gender stereotypes on the respective roles of women and men, however much challenged, seem to still be alive in Maltese society.

The number of children born to single mothers and registered as father “unknown” and the impact on public finances have been increasing in Malta since the late 1990s (Calleja 2012). The minister for health cited this increase in the number of babies born to single mothers to legitimize the introduction of a controversial National Sexual Health Policy (Dalli 2010). It had been drawn up

a decade prior to this date, but its launch was postponed for fear of “upsetting” the church (Massa 2011). O’Reilly Mizzi (1994) emphasized that the social and cultural rules in Malta had been formulated by the Catholic Church and were widely disseminated throughout the community. Due to the important economic and political role played by the church through time in Malta, the models of “proper” Catholic behavior were extremely well-defined and promulgated in every corner of society.

With recent changes in legislation, however, the primacy of the traditional family seems to have shifted. In May 2011, a referendum was held on the introduction of divorce, with a slight majority (53%) voting in favor, notwithstanding strong opposition by the Catholic Church in Malta. Divorce was therefore introduced later that year. It was felt that this might affect church-state relations because marriage laws are a central aspect of church-state relations in Malta. Montebello (2009) states that secularization is challenging the hold the Roman Catholic Church has on the moral values of the Maltese. He argues that the church’s values are being replaced by individualistic values based on human rights issues. In fact, to substantiate this claim, civil unions were introduced in Malta in 2014 for same-sex couples, giving them equal rights to marriage in all but name, further confirming the secularization and human rights argument. In July 2017, same-sex marriage was also introduced.

Sexual Orientation and Gender Identity

In his European values study, Abela (1994b) points out that, by European standards, the Maltese people have retained an extremely strict sexual and moral code. Cole (1994) states that Maltese society is certainly one where everyone is assumed to be heterosexual. Gay men and lesbians are generally seen as challenging the family and the existing relationships of male power and authority.

The official position of the Catholic Church on homosexuality refers to it as a “moral disorder,” and that it cannot be promoted in a Christian society. This has meant that the act of homosexuality has been condemned as morally wrong, or sinful, but the person, that is, the homosexual, is welcome to remain in the church so long as he or she remains celibate. Cole (1994) held that, with such a position as a backdrop, it was hardly surprising that persons with a homosexual orientation remained practically invisible in Maltese society for many years. In recent years, however, there has been a dramatic change in attitudes

and in the visibility of gay men and lesbian women, which was partly led by legislative changes and partly through lobbying activities.

Homosexuality (more specifically, sodomy) was decriminalized in Malta in 1973. The Malta Gay Rights Movement (MGRM) was set up in June 2001, following the dismantling of the Gay and Lesbian Civil Rights Movement. Former organizations that did not survive include Pride of Malta and the Malta Gay Support Group. The MGRM is the longest-surviving lesbian, gay, bisexual, transgender, intersex, and queer (LGBTIQ) organization in Malta and continues to be very active politically and socially.

In recent years, other groups have formed. Currently active, in 2015, are Drachma (an LGBTI Christian group); a Drachma parents support group; WeAre (an organization for student and youth LGBTIQ and straight allies); Gender Liberation (an NGO that connects, informs, and empowers transgender people in Malta and Gozo through community-led initiatives); LGBT Labour (part of the Labour Party); Allied Rainbow Communities (ARC, a new NGO focused on supporting and developing the LGBTI community in Malta); and LGBTIQ+ Gozo (focusing specifically on Gozo, the sister island).

In 2008, the Malta Gay Rights Movement (2011) conducted a survey on LGBT discrimination in Malta and found that 73 percent of the respondents did not reveal their sexual orientation or gender identity to their colleagues at work to avoid discrimination and harassment. In fact, results demonstrate that 13 percent of the respondents had experienced discrimination in employment, and 45 percent had been harassed in the workplace. The Malta Gay Rights Movement survey (2011) demonstrates that 70 percent of participants concealed their sexual orientation or gender identity when attending educational institutions for fear of homophobic reactions. Out of the 150 respondents, 11.3 percent said that they had experienced harassment at school, and 13.3 percent reported that they had been physically assaulted there. An assessment of the National Curriculum Framework (NCF) (a new curriculum implemented in 2012) found that although this document incorporates the principles of diversity and inclusion on the grounds of gender, religion, race, ability, and beliefs, there was no mention of sexual orientation and gender identity (Equality Research Consortium 2010). Education policies have now improved and started to catch up with legislation.

In April 2014, civil unions were introduced in Malta for same-sex couples, giving them equal rights to marriage (including adoption rights) in almost all but name (IVF

and surrogacy are not allowed to same-sex couples). The Gender Identity, Gender Experience and Sex Characteristics Act was introduced in 2015 (Government of Malta 2015a), raising Malta to the top of the LGBTIQ equality index.

Women in Decision Making

Malta has been cited as having the lowest percentage of female board members in the European Union (European Commission, DG for Justice 2013). Viviane Reding, the EU commissioner at the time, came to Malta in 2012 to promote the introduction of gender quotas on publicly listed companies. This suggestion was termed as “heavy handed interference” by the Maltese Chamber of Commerce, Enterprise and Industry (Tabone 2012). The Malta Confederation of Women’s Organisations, on the other hand, used this visit to urge the government to introduce such measures (Timesofmalta.com 2012). In a study conducted by the Times of Malta (Cutajar 2014), only three out of the 19 private companies listed with the Malta Stock Exchange had a female board member in 2012. This report found that 135 board members were male, but only 3 were female. Female representation on the boards of government-owned or controlled entities was higher, with 30 percent of board members being female.

Women are also underrepresented at parliamentary level. In 2014, 9 out of the 69 members of Parliament were female (Cutajar 2014). In 2014, only Hungary had a worse track record than Malta among the EU 28. Maltese women do better in local council elections. In 2013, 21 percent of those elected local councilors were women. In the same year, only 9 percent of the mayors were female (6 out of 62 mayors). On the other hand, 4 (67%) out of the 6 MEPs elected in 2013 were female. Malta can also boast of having a female president, the only female president in the EU member states apart from Lithuania. Marie-Louise Coleiro Preca was appointed president on April 4, 2014. In 2014, Malta had a female president, a male prime minister, and 1 female out of 15 male ministers, which adds up to 7 percent of all ministers.

Issues

Violence against Women

Until 1980, when the Sisters of the Good Shepherd Congregation opened the first shelter for abused women, the issue of domestic violence (and violence against women

more generally) was not considered as an issue among the general public. Since then, great strides have been made, and there are now relatively good services for victims, although further improvements are still needed. Current direct services include the following:

- Four specialized women’s shelters: one emergency short-term (state-run); one emergency longer-term (church-run); one second stage long-term in Malta (church-run); and one in Gozo (church-state partnership);
- A specialized social work unit dealing with cases of domestic abuse (state-run);
- A 24/7 telephone helpline (state-run, but operated by volunteers);
- A sexual assault response team (SART) run as a public-social partnership (state-NGO); and
- Perpetrator services (managing aggressive behavior) (state-run).

While the state-run services are fully funded by the state, the other services receive some funding from the state but rely on volunteer workers for part of the staffing and donations and fund-raising for everything else.

Apart from safe accommodation, the shelters provide various services. Each woman is supported by a professional social worker from the state-run specialized domestic violence unit, who, together with the woman and the staff at the shelter, works on devising and implementing an individual care plan, which can include emotional and psychological support, help finding employment or training for employment, access to benefits, assistance with legal issues, longer-term housing, and assistance with school issues for the children. Some shelters also organize “educational” talks on, for example, self-care, parenting, or budgeting or fun activities, such as barbecues, parties, outings, dance classes, and so on. In each and every case, the workers strive to empower the woman to choose the direction she wants her life to take.

The Domestic Violence Act (Chapter 481 of the Laws of Malta), in force since 2006, set up the Commission on Domestic Violence, which accessed European Social Funds to implement a National Awareness Campaign; training for professionals who come into contact with women escaping or living with domestic violence (police, legal, health, educational professionals, social workers, public service employment advisers); and a prevalence study on domestic violence against women in Malta and its impact

on their employment prospects (Commission on Domestic Violence 2011). In this latter study, interviews were conducted with 1,200 female survey respondents, which found that 23 percent of the partnered women experienced one or more forms of abusive behavior at some point in their lives: 12 percent had experienced physical violence, 9 percent sexually abusive behavior, and 26.5 percent emotional, physical or sexual violence by current or former partners, with 54 percent not having sought any type of help. The research further found that violence disrupts employment or income-gathering activities. Employment or income helped the respondents who suffered some form of abuse attain independence from their abusive partners.

The domestic violence direct service providers cooperate closely and meet regularly to share their experiences and to discuss common problems and solutions. These fora turned out to be very helpful to improve services and to support the staff that often have to deal with harrowing and frustrating situations. However, further efforts are necessary to strengthen the networking with other agencies, such as the police, the law courts, and health services, and more resources are needed generally for both the shelters and the specialized social work unit. Because of increased awareness, more women are seeking help, but unless this is matched with increased resources, it is going to result in a decline in the quality of services being provided.

Malta signed and ratified the legally binding Council of Europe Convention on the Prevention and Elimination of Violence against Women and Domestic Violence (Istanbul Convention), and it came into force in Malta on November 1, 2014. Measures are currently being taken to identify the required changes in legislation and policy to be compliant with the convention.

Human Trafficking

More work needs to be done to prevent human trafficking. Malta is a source and destination country for the sex trafficking of women and children and the labor trafficking of men and women. The sex trafficking victims derive mainly from China, Hungary, Poland, Romania, Russia, and Ukraine, while labor trafficking victims are brought over from China, Indonesia, the Philippines, and Vietnam. Southeast Asian women work as domestic workers, Chinese female nationals work in massage parlors, and women from Central and Eastern Europe are found working in “gentlemen’s clubs.” Irregular migrants who hail from African countries are also vulnerable to

trafficking in Malta’s informal economy (U.S. Department of State 2015).

Malta’s efforts in the sphere of human trafficking have intensified since 2011, with the appointment of an anti-human trafficking coordinator and the establishment of a monitoring committee. One of the first major tasks fulfilled by the monitoring committee was to compile the national action plans to combat the trafficking of persons, the first of which was published on October 4, 2011 (Government of Malta 2011). These national action plans provide for actions aimed at preventing human trafficking, prosecuting offenders, and protecting victims.

Since 2012, the U.S. *Trafficking in Persons Report* (TIP) has rated Malta in Tier 2, up from the Tier 3 in 2010–2011 (U.S. Department of State 2015, 239). Amendments were made in 2013 to the Criminal Code (Chapter 9 of the Laws of Malta) to transpose Council Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims and to replace Council Framework Decision 2002/629/JHA (Government of Malta 2015b). The amendments provide for an increase in the penalty for a human trafficking offense and aggravations linked with this type of crime. The Prostitution and Human Trafficking Unit within the vice squad was set up within the Malta Police Force on January 2012, with a view to combating human trafficking cases. Constant inspections are carried out in clubs and massage parlors by this unit, with the aim of curbing human trafficking. Efforts have been made to ensure that cases of human trafficking are prosecuted and that the victims are provided with the necessary assistance and support.

Poverty

Lack of employment leads to material deprivation. Women, especially single parents, are more likely to experience poverty when they are 59 years old or younger. Men start facing poverty when they reach pensionable age in Malta. Children (20.7% of the 0–17 year olds) and the elderly (19%) are more likely to be at risk of poverty (Cutajar 2014).

Women and Discrimination on the Basis of Age

The Maltese pension system (Vella 2015) has been replaced by a three-pillar system, with the state responsible for only meting out a flat-rate pension to those eligible. Men are more likely to be in receipt of a contributory pension. In 2010, only 34 percent of women of pensionable age had

access to a contributory pension (Bettio et al. 2013). Maltese women are more likely to have access to a derived pension or to depend on the noncontributory age pension, which is means tested. Retirement pensions, on the other hand, are earnings related. This scheme provides for a pension equivalent to two-thirds of the insured person's pensionable income.

Women earn less than men in all job categories and occupational levels. This and the propensity for women to have an intermittent work history means that women tend to receive a lower retirement pension than their male counterparts. The average difference between Maltese men and women's pension was 21 percent in 2010 (when the EU27 average stood at 39%) (Bettio et al. 2013). These statistics denote that women, more than men, are likely to face poverty when they reach retirement. Unfortunately, this does not come out in surveys conducted to gather statistics on income and living conditions, as these surveys do not include participants living in institutions for the elderly, the majority of whom tend to be female.

Beauty Standards, Body Politics, and Media Portrayals

Beauty standards are a subjective and culturally bound phenomenon. The media plays a powerful role in setting and reinforcing standards, and Malta is encompassed in the global standards and subsequent impact of Western beauty standards. The Global Media Monitoring Project (GMMP)—the world's longest-running and most extensive longitudinal study on gender in the news media—has captured data in 2000, 2005, 2010, and again in 2015. Its challenge and undertaking is to monitor women's presence in their national radio, television, and print news, and it has been found that gender parity is nonexistent on a global scale.

The initial study found that, in Malta, only 17 percent of news subjects—the people who are interviewed or whom the news is about—were women. Overall, news stories were twice as likely to reinforce gender stereotypes rather than challenge them, and news stories on gender (in) equality were almost nonexistent. The global data and the local data are similar, and while “there is limited focus on ‘gender issues’ in the media in Malta, [and] despite great efforts by a small number of experts, there is a constant challenge to keep the issues on the agenda and in the media” (Murphy 2010).

And just as media portrayal of women and men in the mainstream news formats does not differ greatly between

international and local data, body politics, that is, how women's, and to a much lesser extent men's bodies, are portrayed, accepted, and used in the media and in the broader cultural landscape, also appear to be problematic on a local, European, and international level. Kilbourne (2000; 2002) talks of these issues—objectification, dismemberment, the thin body, ageism, infantilization of women, trivialization of power—as issues prevailing in advertising, but they unfold and are found bound up in negotiations around the male gaze (Mulvey 1975) and the body ideal (Wolf 1990) in the wider media and in belief systems that are embedded in social and cultural norms. Research evidence now charts the extensive and damaging impacts of dissatisfaction with appearance on physical and psychological health across the life span, with negative consequences cutting across all areas of living (Stice 2002). To address these issues, the Department of Gender Studies at the University of Malta is currently involved in a series of Europe-wide research projects around appearance in the guise of a COST Action (COST Action IS1210), which looks at “appearance” and the consequences of dissatisfaction around appearance.

The socioeconomic and legal position of women in Malta has improved thanks to a number of legal and cultural changes that have occurred in the last 40 years. Despite these, more work needs to be done to ensure that women participate in all spheres of social life, namely, in employment and decision making. Caring responsibilities, which still fall mainly on women, prevent them from partaking fully in all spheres of social life in Malta. The fear of violence, which sometimes escalates to femicide, is another issue that needs to be tackled. The prevalent culture's propensity to define young female bodies as objects is not helping girls and women to believe in their own capacity to work together to create a more equitable and just Malta.

N

Netherlands

Overview of Country

The Kingdom of the Netherlands is a sovereign state that consists of a country in Western Europe, the Netherlands, that is bordered by the North Sea to the north, Germany to the east, and Belgium to the south; the three countries of Aruba, Sint Maarten, and Curaçao, located in the Caribbean; and the three Caribbean special municipalities of Bonaire, Sint Eustatius, and Saba (also known as the BES islands and formerly of the Netherlands Antilles). The country's total landmass is approximately 16,412 square miles (CIA 2016).

More than half of the flat continental country is below sea level, although there are hills in the southeast. The climate is temperate and marine, with cool summers and mild winters; the Caribbean islands range in climate from temperate to tropical and are subject to trade winds and seasonal hurricanes. The highest point in the Netherlands is Mount Scenery, on the Caribbean island of Saba, at 2,828 feet; the highest point in the continental Netherlands is the Vaalserberg, a hill in the province of Limburg in the southeast, at 1,056 feet. The country is located at the mouths of three major European rivers: the Rhine, the Maas, and the Scheide.

As of March 2017, the estimated population of the Netherlands is approximately 17,103,089 people, making

it the 63rd-largest country in the world and the most populous country in Europe by size (CIA 2016). The population is heavily concentrated in the southern area of the country known as the Randstad, with the north being more sparsely populated. The three largest cities in the Netherlands are Amsterdam, Rotterdam, and The Hague. The Port of Rotterdam is the largest port in Europe. Citizens of the Netherlands are known as Dutch, with the gendered nouns being Dutchman and Dutchwoman. As of 2014, the breakdown of the population of the Netherlands is as follows: Dutch 78.6 percent; European Union 5.8 percent; Turkish 2.4 percent; Indonesian 2.2 percent; Moroccan 2.2 percent; Surinamese 2.1 percent; Bonairian, Saba Islander, and Sint Eustatian 0.8 percent; and other 5.9 percent (CIA 2016). The primary official language of the Netherlands is Dutch, although Frisian, Low Saxon, Limburgish, Romani, Yiddish, English, and Papiamentu are also used (CIA 2016).

In 1568, the Eighty Years' War began with the Spanish, and in 1579, the Dutch United Provinces, seven provinces that are also known as the Dutch Republic, declared their independence from Spain after forging the Union of Utrecht. The country became known throughout the world for seafaring and trading during the subsequent century; the Dutch East and West India Companies were founded to trade with New Guinea, Bornea, Sumatra, and Java, as well as the Caribbean, Brazil, and North America. In 1830, the southern states revolted and became Belgium. The

Netherlands continued to rely on agriculture and the labor of African slaves, until slavery was abolished in 1863. It was one of the last European countries to become industrialized in the later part of the 19th century.

During World War I, the Netherlands was able to maintain neutrality, partially because of its role as a supply hub for both sides of the conflict. During World War II, Germany invaded and occupied the Netherlands. The Netherlands is now a modern, industrialized nation and a large exporter of agricultural products. It was one of the founding members of the North Atlantic Treaty Organization (NATO) and the European Union (EU). As a member of the World European Central Bank, the Netherlands converted its currency to the euro in 1999.

The Kingdom of the Netherlands comprises the 12 provinces of the Netherlands proper: South Holland, North Holland, Utrecht, Limburg, North Brabant, Gelderland, Overijssel, Flevoland, Groningen, Zeeland, Friesland, and Drenthe; the Caribbean islands of Aruba, Curacao, and Sint Maarten; and the special municipalities of Bonaire, Saint Eustatius, and Saba, which are also in the Caribbean. Most of the Kingdom's affairs are administered by the Netherlands, which makes up about 98 percent of the kingdom's total land area and population. The capital of the Netherlands is Amsterdam, and the governmental seat is The Hague.

The government of the Netherlands is a parliamentary representative democracy, a constitutional monarchy, and a decentralized unitary state. It is composed of executive, legislative and judicial branches. The Netherlands has the sixth-largest economy in the European Union. It plays an important role as a European transportation hub as well as exporting goods and services. The gross domestic product (GDP) is USD \$769.9 billion as of 2015; 70.4 percent comes from services, 17.8 percent from industry, and 1.6 percent from agriculture, according to 2016 estimates. The unemployment rate in the Netherlands is 6.2 percent, ranking it 67th out of 208 countries (CIA 2016).

Gender Politics

According to the United Nations Development Programme, the Netherlands ranks fifth on the Human Development Index (HDI; 0.922. Average life expectancy is 81.6 years (UNDP 2015a). The Netherlands ranks 7th on the Gender Inequality Index (GII; 0.062) and 0.947 on the Gender Development Index (GDI), with 87.7 percent of women having a secondary-level education; however,

Dutch women only represent 58.5 percent of the labor force and 36.9 percent of the seats in Parliament.

Girls and Teens

Females represent slightly over half of the population of the Netherlands (50.4%), and 16.56 percent of the population is 14 years old or younger. Less than half of children 14 and younger are girls, at about 8 percent (IndexMundi 2016). Girls are expected to spend 18 years in primary through tertiary levels of education, the same rate as boys.

Sex Education

Adolescent sex education is very effective in the Netherlands, and teenage pregnancies are about seven times lower than pregnancies in the United States, which has the highest rate of teenage pregnancy in the world. The efficacy of sexual education is due in part to the cultural normalization of adolescent sexuality, greater access to sex education in schools and at home, and access to contraception. Dutch parents and health care providers see the sexual behavior of young people as an acceptable part of adolescent development, and they encourage youth to use contraceptives responsibly and to develop healthy relationships. Health care providers, policy makers, and members of the media facilitate a normalization of adolescent sexuality by ensuring young people have access to sexual education in school and at home, contraception, and public forums for the discussion of sexuality and relationships.

Organizations such as Rutgers International have developed comprehensive sexual education programs that are taught at schools, beginning as early as age four (Rutgers 2017). In addition to teaching children about sexual development, they also educate them about consent, respectful contact, sexual diversity, and masculinity. Contraception is usually accessible to people both because it is widely promoted and because Dutch incomes tend to be higher, so it is not cost-prohibitive (European Parliament 2015). Dutch teenagers over the age of 15 may also consent to legal and free abortions (Santelli 2009).

Recreation

In 2013, Dutch families spent 37.1 percent of their leisure income on vacations; 21.7 percent on hotels, pubs, and restaurants; and 16.3 percent on recreation, sports, or other cultural services (CBS 2017). Popular sports in the

Netherlands are soccer, ice-skating, cycling, swimming, and regional sports (Dutch Community 2012).

Girls with Disabilities

Antidiscrimination laws exist throughout the Kingdom of the Netherlands to protect persons with physical, sensory, intellectual, and mental disabilities. In the Netherlands, the Act on Equal Treatment on Grounds of Disability or Chronic Illness (WGBH) requires equal access to employment, education, travel, housing, and goods and services, including stores, movie theaters, and sports clubs. Although there are criminal penalties for discrimination, it was found that enforcement of these rules was inadequate. The Parliament has adopted comprehensive legislation to implement the UN Convention on the Rights of Persons with Disabilities, which made significant adjustments to the WGBH Act (U.S. Department of State 2016a)

Health

The Dutch population enjoys open access to high-quality essential health care services. Everyone in the Netherlands must subscribe to mandatory health insurance, although the government requires that health insurance companies must accept all applicants and charge a flat rate for basic insurance. Out-of-pocket costs are typically low. Additional premiums may be paid for services such as optometry, physical therapy, and alternative medicine. In some cases, employers may arrange for health care through the company. The health of the Dutch population is good based on relatively low avoidable mortality and increasing life expectancy. Ethnic minorities tend to have poorer health relative to the Dutch national population (WHO 2016).

Health risk factors for Dutch women include tobacco use (23%), raised blood pressure (17.6%), obesity (16.1%), and raised blood glucose (4.1%) (WHO 2015). Obesity overall is low compared to other surveyed countries, but it tends to be less prevalent among young women and adolescent girls. Women tend to encounter hearing, vision, and mobility impairments more often than men. More women than men in the Netherlands also have long-term illnesses or disorders, psychological issues, tend to go to the hospital and take medication, and die from cancer and heart disease. Poorer health in women is assumed to contribute to lower participation in the workforce (European Parliament 2015).

In 2014, more than one-tenth of the Dutch population over the age of 12 suffered from psychological complaints,

with 14 percent being women compared to 9 percent of men. Notably, girls between 16 and 20 years old and women 65 and older described feeling gloomy, depressed, or anxious more frequently than their male counterparts (CBS 2017).

Reproductive Health

Contraceptives are available through a general practitioner for free for Dutch girls up to the age of 20. Of women between the ages of 16 and 50, 37.4 percent use the pill, and 60 percent of girls between the ages of 16 and 20 use the pill. Emergency contraception such as the morning-after pill is available as well (European Parliament 2015). Abortion is legal in the Netherlands and may be obtained up to the 24th week of the pregnancy, although there is a mandatory 5-day wait to receive the procedure. Women living in the Netherlands obtain approximately 28,000 abortions annually, predominantly women aged 20–24 (European Parliament 2015).

Education

The Netherlands requires compulsory education for youth ages 5–18, and there are a variety of educational structures and options. Both public and private schools are publicly funded; private schools may focus on a particular religion or educational style. Primary education is for children aged 4–12. Secondary education (middelbare school) typically begins at age 12 and is divided into four possible tracks, which qualify the student for various types of tertiary or higher education or a vocation. Prevocational secondary education typically lasts four years (VMBO); students who complete VMBO then move on to vocational education for students aged 16–18 (MBO), where they can continue learning a trade. General secondary education (HAVO) lasts five years, and preuniversity education (VWO) lasts six years, with both usually needed for admission into more competitive university tertiary educations. Tertiary education is conducted at two levels, professional (HBO) and academic (WO), at research universities, universities of applied sciences, and institutes for international education (The Hague 2016).

More women than men aged 30–39 have been educated at higher vocational or university levels. During the past decade, the proportion of highly educated young women has also risen more rapidly than among young men. As a result, the gap between highly educated women and men

in this category is widening (CBS 2017). Despite being more highly educated than men, girls tend to choose natural science and technology paths less often than boys. Only 6 percent of girls compared to 46 percent boys chose these paths at the basic education level; just 9 percent in secondary education; and 23 percent at the university level. However, studies show that 70 percent of women with scientific education work in nontechnical fields (Women for Water Partnership 2017).

Family Life

In the Netherlands, women are more likely than men to stay home and care for the household. This contributes to lower participation rates of women in the Dutch labor force. However, rather than see this as a sign of gender inequality, some accounts position the fact that women tend to work fewer hours as intentional on the part of Dutch women—both as a measure to achieve a greater work-life balance, and a feminist choice to determine how their time is spent (Ward 2011). In this way, many popular accounts have characterized Dutch women as among the happiest in the world, attributing this happiness to their valuing independence over career success. In 2011, close to 75 percent of Dutch women were employed part-time (Ward 2011). Some researchers, however, believe this disparity is because Dutch women have become complacent with lives as homemakers rather than pursuing ambitious career paths.

Marriage

In the Netherlands, there are two types of partnerships regulated by law: marriage and registered partnership. Couples can also sign a cohabitation agreement, which must be notarized and outline the rules of cohabitation. If heterosexual couples who have signed a cohabitation agreement have a child, the mother automatically becomes the legal mother, while the father must file for paternity. Law does not protect couples that choose not to engage in a contract or legal partnership. According to Dutch law, you must be at least 18 to marry and cannot marry relatives, marry more than one person, or be forced into marriage. One partner must be a Dutch citizen. If all debts and properties are shared, marriage automatically takes place, although certain stipulations can be made.

As of 2011, among people over age 20, a majority of Dutch people were married (53%), and two-thirds were in

committed partnerships. The second-largest group is single people (30%), but this includes people who have partners but are not registered. Fourteen percent were cohabitating, but without a marriage or registered partnership (a consensual union). One percent was in a registered partnership (an option that was introduced in 1998), and 7 percent were widowed (Eurostat 2015). Despite the introduction of same-sex marriage in 2001, the marriage rate in the Netherlands has been declining since 2000, while the age at first marriage rose. In 2013, same-sex marriages comprised 2 percent of all marriages that year (Eurostat 2015).

Childbearing

The mean age that a Dutch woman has her first child is 29.4 years. Women on average have 1.76 children (CIA 2016). Working women are entitled to 16 weeks of paid maternity leave, and men are sometimes awarded paternity leave. A co-mother can become a legal parent of her female partner's child through a legal adoption procedure, by acknowledging the child, or if the child was conceived through an anonymous sperm donor (European Parliament 2015).

Household Roles and Responsibilities

Sharing household duties, work, raising children, and other physical care between the sexes is still imbalanced in the Netherlands, with women working less and taking on more household responsibilities on average than men. Women predominantly work part-time jobs, even when not raising any small children. In 2015, the average working week of women was 26.6 hours. Men tend to work full-time, even with small children. However, half of the men who recently became first-time fathers opt for a weekly half or full parenting day ("papadag"). Most of them take up parental leave or start working flexible hours. As for young mothers, nearly all maintain at least one parenting day ("mamadag") a week, and they are twice as likely to take up parental leave. This difference between mothers and fathers in terms of working hours has not changed dramatically over the last several years. Women are also more likely to care for sick parents (or in-laws) and other sick family members (CBS 2017).

Politics

The Netherlands is generally regarded as a tolerant and liberal country. It has legalized abortion, prostitution, and euthanasia and has maintained a progressive policy

on recreational drugs. It became the world's first country to legalize same-sex marriage in 2001. Women gained the right to vote in 1919, but they are underrepresented in leadership roles in business and politics. Policies such as the Beijing Platform for Action, the Vienna Declaration and Programme of Action of 1993, and the Programme of Action adopted at the International Conference of Development in Cairo in 1994 focus on removing barriers to entry for women to achieve equality and greater representation within Dutch society. Further studies examine the role of women in government and agree that the gap between women and men on political empowerment remains. One proposed solution is to set aside 30 percent of seats for women in national parliaments as a step toward gender parity. Women represent almost half of the population of the Netherlands, and the thought is that more representation in political bodies could shift voting on policies that would benefit women and highlight issues such as health and education (Ministry of Foreign Affairs 2015).

In efforts to encourage gender equality, the Dutch government has taken a variety of measures. Every two years, the Dutch government awards the Joke Smit award to those who have made a fundamental contribution to improve the position of women in the Netherlands. The award is named after feminist Joke Smit (1933–1981), who played a pioneering role in the women's liberation movement in the Netherlands. The winner receives a sum of €10,000. The 2015 Joke Smit award went to Vreneli Stadelmaier for her efforts on the topics of women in management positions, economic independence of women, and equality between men and women. The Dutch government also provides an annual incentive award to people and organizations who improve the position of women and girls in society; the winner receives a work of art and a prize of €1,000.

Representation in Government

The average representation of women in local politics is low (25%); however, in the four major cities, it is higher as of 2014 (38%). There are more female representatives in provincial councils (24.7% in 2015). There are few measures of intersectionality regarding women in politics, as ethnic minorities and women are often counted separately; however, the most recent figures of political participation of ethnic minority women are 1 percent in 2010. Research has revealed that there are barriers to entry for female participation, including timing of meetings conflicting with

family obligations. Pay for local councilors is low and does not cover the cost of living. Discrimination by men could be a problem. Nongovernmental organizations (NGOs) and Civil Society Organizations (CSOs) are suggesting that the government investigate the structural obstacles to women's political participation in municipal councils and to consult with local administrators as to how to overcome these obstacles (Women for Water Partnership 2017). As of 2017, female participation in senior public service positions has risen from 26 percent in 2012 to 31 percent in 2015, which achieves the government's goal. However, some public services have fewer female representatives, and this tally does not take into account people of color (Women for Water Partnership 2017).

Women's Rights

The Dutch Constitution specifies that everyone in the Netherlands is entitled to equal treatment under the law. Article 1 of the Constitution forbids discrimination on the grounds of race, sex, sexual orientation, political opinion, religion, belief, disability or chronic illness, civil status, age, nationality, working hours, or type of contract. Various statutory provisions also prohibit discrimination, including the Equal Treatment Act. Article 7 of the Constitution guarantees freedom of expression, subject to certain limitations (Government of the Netherlands 2017a).

LGBTQ Rights

Same-sex marriage has been legal in the Netherlands since 2001, and since then, over 15,000 gay couples have married. However, there are certain differences between same-sex marriage and marriage between a man and a woman in the Netherlands. Discrimination based on sexual preference is forbidden according to Dutch law. Dutch law also provides provision for co-mothers to become legal parents of children who are adopted or conceived according to artificial insemination, as discussed in a previous section (Government of the Netherlands 2017d).

Intersex children in the Netherlands are still subject to "corrective" surgery at an age where they cannot give free and informed consent, and this matter is being suggested as needing review to make sure it is in compliance with The UN Special Rapporteur on Health, which has stated that partial clitoridectomy as part of the treatment of intersex persons is a form of female genital mutilation (FGM) (Women for Water Partnership 2017). As of 2016, the government has decided to reduce the number of

A Sámi family in *gákti*, traditional dress, in Lapland, Sweden. Sámi refers to northern Europe's indigenous people who live across Sápmi, a region divided between Norway, Sweden, Finland, and the Russian Kola Peninsula. Today, Sámi women lead via democratically-elected positions in the Sámi Parliaments established in Norway, Sweden, and Finland, to represent Sámi interests at the national level. (Cultura RM Exclusive/Philip Lee Harvey/Getty Images)

Armenian women hold torches during a march in Jerusalem, Israel, April 23, 2015, to commemorate the 100th anniversary of what many call the first genocide of the 20th century. In 1915, the Ottoman (Turkish) government began the systematic extermination of its Armenian minority population. It is estimated that between 600,000 and 1.5 million Armenians died in massacres, deportations, and forced marches. (AP Photo/Dusan Vranic)

Savchenko, the first Ukrainian woman to train as military pilot and to fly a bomber in combat, was imprisoned by the Russian government. In 2014, while still imprisoned, she was elected to the Ukrainian parliament. Her story was the subject of a documentary film, and her detention sparked human rights protests against Russia. Savchenko was finally released in a prisoner exchange in May 2016. (AP Photo/Sergei Chuzavkov)

Campaigners for both sides in the 2014 referendum on Scottish independence gather on High Street, in Perth, Scotland, shortly before a visit by First Minister Alex Salmond and Deputy First Minister Nicola Sturgeon, September 12, 2014. The “no” campaign prevailed and Scotland remained part of the United Kingdom. In November 2014, Sturgeon became the first woman First Minister of Scotland. (Jonathan Mitchell/Dreamstime.com)

An art restorer works on a fresco painting at a chapel in Italy. In 2014, Italian women earned 94 percent of the average income of Italian men, the smallest gender pay gap in Europe. While fewer women work full-time in Italy than in Northern European countries, Italian women who work tend to be better educated than their male counterparts. (ilbusca/Getty Images)

official documents that require people to indicate their gender identity (Government of the Netherlands 2017b).

Divorce

The number of divorces in the Netherlands in 2013 was 33,636, which was half the number of marriages for that year. Even though the number of marriages has decreased since 1970, the percentage of the population that is married has remained more or less stable. As of 2011, only 9 percent of the Dutch population was divorced (Eurostat 2015). As many women tend to make less money than men in a relationship, if the relationship breaks up, women are left with 25 percent less purchasing power (CBS 2017).

Employment

Dutch women up to age 45 are more highly educated than Dutch men; however, women are still underrepresented in the labor market. Women have fewer paid jobs, work fewer hours, and receive less pay than men (CBS 2017). The Dutch government seeks to create gender equality through promoting the economic independence of women by raising the number of women who are employed. This includes encouraging women to seek jobs and helping to create a framework for men and women to share work and care responsibilities in a more balanced way (Government of the Netherlands 2017b).

An obstacle to women seeking employment outside of the home can be balancing work with child care. Since Dutch women are primarily responsible for caring for children, the government encourages businesses to arrange flexible working hours, introduce systems for parents to take time off, or help fund the cost of child care. Creating these opportunities for both sexes would allow women to enter the workforce in increasing numbers. The government is also working with city governments to provide learning opportunities and training for women with few business skills. The government has mandated that management in businesses must consist of 30 percent women and 30 percent men, as diversity has been shown to boost corporate results (Government of the Netherlands 2017b).

The government has also asked organizations such as the Social and Economic Council of the Netherlands for help in identifying stereotyping and discrimination in the labor market. By the end of 2014, a document titled “Discrimination Does Not Work!” outlined recommendations to prevent and combat discrimination, focusing on specific

groups of women, including increasing awareness of stereotyping. In addition, the government stimulates initiatives to encourage young people to choose professions traditionally dominated by the opposite gender (science and technology for girls; education for boys) (European Parliament 2015).

Part-Time Work

The greatest gender disparity in the Dutch labor force is in the arena of part-time work. More than three-quarters of Dutch women with a job work part-time, and this proportion is the highest found in Europe, with the EU average at 33 percent of women. About a quarter of all working Dutch women work less than 20 hours per week. The most common explanation for this gender disparity in part-time work is the presence of children. In dual-earner Dutch households with young children, the most common model is for the man to work full-time and the woman to work part-time. However, working part-time has become common among women in all age groups, with or without children (European Parliament 2015).

Typical Careers and Pay

The Dutch labor market is starkly segregated by gender. Women disproportionately work more in social services arenas, including health care, education, and the hospitality industry (European Parliament 2015). The pay gap in the Netherlands is also highly divided by gender. On the whole, Dutch women earn lower incomes than their male counterparts. In 2012, the gender pay gap in the Netherlands was 16.9 percent, which is slightly higher than the EU average of 16.4 percent. Reasons given for the pay gap in the Netherlands are differences in work experience, education level, and management level between men and women (CBS 2017). However, in a nation where women are overwhelmingly undertaking part-time work, it is no surprise that they are falling short compared to men in the realms of work and managerial experience.

Prostitution

Prostitution is legal in the Netherlands as long as the parties involved are consenting adults. Prostitutes in the Netherlands can work as freelancers or paid employees. The Dutch government is working to amend its rules for businesses in the sex industry to protect sex workers from exploitation, as abuses in the industry still occur.

The Government of the Netherlands has established a national program to tackle such abuses, working primarily to improve the social position of prostitutes, to make and maintain contact with prostitutes, and to increase supervision and law enforcement in the sex industry (European Parliament 2015).

Issues

Major human rights issues in the Netherlands currently include animosity and discrimination against certain ethnic and religious minority groups (primarily Muslim immigrants), domestic violence against women, child abuse, and human trafficking (U.S. Department of State 2016c). Because prostitution is legal in the Netherlands and because of its geographical location, human trafficking has become one of the largest issues facing women there today.

Human Trafficking

The Netherlands is referred to as a destination, transit, and source country for women and children from Africa, Eastern Europe, the Netherlands, and South and East Asia who are the victims of sex trafficking and forced labor, including domestic servitude, offshore oil exploration, and agricultural work, among others (U.S. Department of State 2016c). Dutch girls are also at risk of being enticed by male traffickers who convince them to enter into a sham relationship only to then intimidate and exploit them sexually. Other vulnerable populations for sex trafficking include unaccompanied children, asylum seekers, women who have entered into a fraudulent marriage, and domestic workers for foreign diplomats. The media and police reported in January 2016 that human traffickers targeted and recruited women at asylum centers for prostitution (U.S. Department of State 2016c).

According to the U.S. State Department, the Netherlands meets the minimum standards to eliminate human trafficking. The Dutch government makes significant strides to investigate, prosecute and convict sex trafficking offenders. In addition, the Dutch government also enforces victims' rights (U.S. Department of State 2016c). Law enforcement agents must refer victims to protection services. The Dutch government has also made efforts to raise awareness of sex trafficking. In 2015, 215 individuals were investigated by the prosecutor's office for trafficking relative to the 280 cases investigated in 2014. Of those 2015

cases, 189 defendants were prosecuted and 139 convicted relative to the 192 prosecuted and 134 convicted in 2014 (U.S. Department of State 2016c). The conviction rate only rose slightly between 2014 and 2015, from 70 percent to 74 percent. On the whole, human trafficking for the purpose of sexual exploitation remains a serious problem in the Netherlands.

Child Abuse

In the Netherlands, youth are defined as being 25 years old or younger. There were approximately 5 million children and youths in this age group in 2015 (Netherlands Youth Institute 2017). One in four children in the Netherlands have an immigrant background, and 15 percent live in a one-parent household. Child abuse is defined as any form of physical, psychological, or sexual threat or violent behavior toward minors (De Baat et al. 2011). In 2005, the Netherlands enacted this definition into the Act on Youth Care. In 2010, 118,000 Dutch children or youths were the victims of abuse. This included 3.4 percent of children and youths between the ages 17 and younger. De Baat (2011) and colleagues also noted that 34.6 percent of students between the ages of 12 and 17 had experienced at least one form of abuse during their lifetime and as many as 18.7 percent during the year prior. In response to these rates of abuse, the Dutch government has been active in legislation aimed at preventing and recognizing the signs of abuse. These efforts include the 2007 Children Safe at Home Plan and the 2011 Children Safe. The Children's Ombudsman and the Children's Rights Collective have been instrumental in publishing reports on how child abuse is managed in the Netherlands.

Violence against Women

The rate of abuse against women in the Netherlands is quite high. According to statistics, 39 percent of all women in the Netherlands have been the victims of sexual violence at some time in their lives. This statistic is likely much higher in reality due to underreporting. The government of the Netherlands has implemented policies designed to encourage women to report domestic violence, which could account for recent increases in the number of reported cases of domestic violence. Violence against women may be the result of the power inequity between genders in the Netherlands as well as stereotyped thinking about gender roles, which is often reinforced through the media. To tackle this issue, the Dutch government has

produced learning packages for use in sex education and media literacy classes in Dutch secondary schools (European Parliament 2015).

Norway

Overview of Country

Norway is situated at the northernmost tip of continental Europe with an approximate total area of 200,000 square miles (323,802 sq. km). It is bordered by the countries of Finland, Sweden, and Russia as well as by the North Sea and North Atlantic Ocean. The coastline is defined by innumerable fjords that stretch inward toward the mountainous terrain. With about two-thirds of its total landmass occupied by rugged mountainscapes, Norway is composed of high plateaus divided by small valleys and plains with a large arctic tundra in the north that remains mostly uninhabited.

Although archaeological evidence suggests that people began settling in Norway around 10,000 years ago, it was not until the Viking Age (800–1030 CE) and the advent of Christianity under the rule of Olav Haroldsson (1030 CE) that the histories of towns and villages began to be recorded. About 82.1 percent of Norway's total population are members of the state's official church, the Church of

Norway (CIA 2016). After Haroldsson's death, Norway found itself in a long period of strife and civil war, as various individuals made claims to the crown. Despite ongoing inner conflict, by the 13th century, Norway had expanded its reign to include dominion over Iceland, Greenland, Shetland, the Faeroes, and the Orkney Islands. This all changed when the Black Plague hit Norway in the 1350s and wiped out more than half its population (Norway.org 2015). Weakened, Norway formed unions with Denmark (1380–1814) and Sweden (1814–1905). Norway's union with Sweden ended in 1905 when Haakon VII was crowned the Swedish king. Norway then regained independence under a new constitution.

In the 1960s, large deposits of oil and gas were located off Norway's coast, and drilling boosted Norway's economy. Ranked as the world's third-largest natural gas exporter and seventh-largest exporter of oil, Norway continues to prosper from these resources as well as from fish, minerals, and forests (CIA 2016). Despite contributing significantly to the European Union (EU) budget, Norway remains a nonmember.

As of July 2015, the total population of Norway was 5,207,689. This includes 94.4 percent classified Norwegian, 3.6 percent other European, and 2 percent as other. Some 60,000 Sami, the indigenous peoples of Scandinavia, are included under Norwegian (CIA 2016).

Despite being ranked 1st out of 187 nations on the Gender Inequality Index (GII; 0.068) in the UN Human Development Programme (UNDP 2014), Norway continues to struggle with issues of domestic violence, transgender rights, a gender pay gap, and higher rates of illness affecting women.

Girls and Teens

As of 2015, approximately 18 percent of Norway's total population fell in the age group of 14 years old and younger, with another 13 percent aged 15–24. Of this particular population, slightly less than half are girls (CIA 2016). Despite being slightly outnumbered by boys, girls in Norway fair slightly better than their male counterparts in school life expectancy and youth unemployment rates (CIA 2016).

Literacy

Norway ranks quite high in youth literacy, with a regional average of 99.8 percent among 15- to 24-year-olds, equally divided among boys and girls (UNESCO 2015). Such high

numbers paired with increasing numbers of girls going on to pursue tertiary education have placed Norway as a leader in education rights globally. Norway has just recently used this platform to not only continue to fight for girls' rights to education locally but also on a global scale as well in their pledge to contribute to the Global Partnership for Education.

Sex Education

Norway is in the process of implementing an inclusive, straightforward sexual education program in which children are targeted as the main audience. Such a program includes discussions on sexual health, birth control, consent, and nonheteronormative identities as well as the naturalness of sex. Despite being viewed as progressive by some, the program has also come under recent criticism as further targeting and sexualizing youth by implementing a program at young ages.

Health

Although Norwegian citizens enjoy a relatively high life expectancy overall, Norwegian women have a slightly higher current life expectancy than men (84.1 years at birth) (Statistics Norway 2015a). With one of the lowest mortality rates in the European Union and an increasing density rate of doctors per capita, Norway fares quite well in regard to health care. Despite this, there has been dismay over long waiting periods for elective care.

Access to Health Care

Health care in Norway is provided by the National Insurance Scheme and is based on the principles of universal access, decentralization, and free choice of provider. Being one of the most sparsely populated countries in Europe, Norway still struggles with ensuring equal access to health care among all geographical and social lines, despite having a large ratio of health care workers per capita.

Maternal Health

Norway was one of many countries to experience a post-war baby boom until around the 1960s. Since then, Norway's birth rates have showed an overall general decline, coming in with a current fertility rate of just under two births per woman (CIA 2016). Despite being set up for a general decline in population, Norway is actually on the

higher end of fertility rates compared to other EU countries. There is speculation that this may be an effect of more women going into the workforce and pursuing post-secondary education. As such, the average childbearing age for women has increased to around 30.6, compared to 26.6 in the 1970s (Statistics Norway 2015a). All examinations during and after pregnancy are free of charge to women. Pregnant women and children, regardless of residency or citizenship, are also afforded access to immunizations and primary health care.

Abortion rates have remained relatively stable at around 14,000–16,000 a year in Norway since the passing of the 1978 Abortion Act, which put the decision in the hands of expectant mothers up to the 12th week of pregnancy. This rate is highest among 20- to 29-year-olds, with an estimated 2 percent obtaining abortions. The number of abortions compared to births is almost double among 15- to 19-year-olds (Statistics Norway 2015a). As part of Norway's larger health care initiatives, all abortions are free and guaranteed to take place in a hospital with a licensed physician. Despite having a fairly open policy around abortion, new legislation is expected to be proposed to tighten the law after reports of illegal abortions past the recommended 18 weeks were discovered being performed in local hospitals. Opposition comes from claims that the section titled "social issues" as one of the possible cited reasons for abortion is too vaguely worded and allows for the abortion of healthy and viable fetuses (The Local 2014).

Diseases and Disorders

While a large focus is placed on breast cancer and preventative measures, the leading cause of death for women in Norway is heart disease. According to Statistics Norway's latest poll in 2012, 1,439 women died of a heart attack compared to 645 dying from breast cancer (Bergström 2015). Although showing a significant decrease from the peak of heart attack-related deaths in the 1970s, many doctors are urging researchers to focus more specifically on women's hearts and related diseases, emphasizing the still minimal level of knowledge that is produced in the field.

Education

Norway spends about 6.6 percent of its gross domestic product (GDP) annually on education (CIA 2016) and contributes significantly to funding educational initiatives abroad. Recently, Norway has seen a steady increase in the

number of women enrolled in all levels of the education system, especially that of postsecondary education. Overall, an estimated 6 out of 10 students today are women (Statistics Norway 2015a).

Primary and Secondary Education

Kindergarten is not mandatory in Norway, but there has been a recent push to change this. Currently, almost 98 percent of 3- to 5-year-olds are enrolled in kindergarten or some form of preprimary education (Statistics Norway 2015a). If not enrolled in a preprimary course, most children start their schooling at the age of 6 and are required to complete a mandatory 10 years of primary and secondary schooling.

Since almost all schools at the primary and secondary education level are public, curriculum is generated and monitored by the state and the Ministry of Education. Having a relatively large population of Sami, a specific Sami curriculum is required for all students. An extra, specialized Sami curriculum is given in areas that are defined as Sami districts to continue to preserve and promote the Sami language and cultural traditions. State textbooks are also provided in the Sami language for students.

Despite the prevalence of women in the education system, many still follow more “traditionally feminized” program paths (design, health, music, etc.), with enrollment in programs such as construction and other technical fields falling well below 20 percent (Statistics Norway 2010).

University Education

There are 53 accredited and 22 nonaccredited higher education institutions in Norway; a majority of them are run by the state, and all offer free tuition (Bakken 2013). The increase of women pursuing postsecondary education is especially high, with more than 65 percent of all university-level students being women. Women are now the majority of students who pursue degrees at the bachelor’s, master’s, and PhD levels (Statistics Norway 2015a), and this is expected to continue to increase as Norway implements more laws and policies aimed to benefit women in higher education.

Whereas men still make up a majority of those enrolled in the Norwegian University Police College (60%), an increasing 40 percent of those enrolled are now women, as more women enter the workforce. Although enrollment in military colleges has doubled since 2000, women still only make up 14.2 percent of those enrolled (Statistics Norway

2015a). Experts expect this number to change, as laws pertaining to the draft are beginning to include women for the first time.

Adult Education and Lifelong Learning

Similar to the patterns displayed among school-age children and young adults, women are more likely to enroll in adult education programs as well as lifelong learning courses in addition to their jobs. This accounts for education at all levels: primary, secondary, and tertiary. The Programme for Basic Competence in Working Life funds courses that aim to help those who may struggle with writing and other basic skills aligned with their career paths.

Employment

Norway fares quite well in terms of equal employment, ranking 2nd out of 145 countries in the Gender Gap Index (WEF 2015). Although making great strides, women are still more prevalent in typically gendered positions, such as secondary school teachers, nurses, and cleaners. Overall, Norway’s unemployment rate hovers around 3.1 percent (WEF 2015), with women’s unemployment being slightly lower than the men’s (Statistics Norway 2010).

Formal Labor

Women in Norway make up 47 percent of the total labor force. Although this rate has been on a steady increase since the 1970s, the number of women in Norway who work full-time is still below that of men, with most of the women in the labor force working in part-time jobs (Statistics Norway 2015a). This is the direct result of most women working in services such as health care, in which time is split between multiple part-time positions with few full-time alternatives. In 2012, an estimated 39 percent of women worked part-time, while only 1 percent of men did the same (U.S. Department of State 2013).

Despite a heightened effort for overall gender equality and the large number of women pursuing postsecondary education, male and female career paths still tend toward more traditional, or gendered, roots, with men making up a larger percentage of construction workers, doctors, and engineers. Overall, more women work in the public sector, with a majority of local government positions being held by women. Despite this and a quota law in 2003 that required company boards to have at least 40 percent of

The Norway Model of Boardroom Quotas

Corporate boards notoriously omit women from membership. In the United States, women represent less than 15 percent of board members for Fortune 1,000 companies. In 2008, Norway created a quota for board membership that requires at least 40 percent of board members to be women. Although women's presence on these boards hasn't yet had much of an impact on the bottom line, improvements have occurred in other ways, such as "more focused and strategic decision-making, increased communication, and decreased conflict" (Sweigart 2012). Now other European countries—Spain, France, Iceland, the Netherlands, Italy, and Belgium—have also passed laws requiring greater numbers of women on corporate boards. Unfortunately, increased representation on boards has not led to increased representation as CEOs. In fact, no woman is CEO for any of Norway's 60 largest companies. Researcher Mari Teigen quipped, "Women tend to believe there is a problem with the industry. Men tend to think there is a problem with the women" (Lindahl 2015).

Lindahl, Björn. 2015. "Norway's Female Boardroom Quotas: What Has Been the Effect?" *Nordic Labour Journal*, May 21. Retrieved from <http://www.nordiclabourjournal.org/artikler/forskning/research-2015/article.2015-05-20.3011019632>.

Sweigart, Anne. 2012. "Women on Board for Change: The Norway Model of Boardroom Quotas as a Tool for Progress in the United States and Canada." *Northwestern Journal of International Law & Business* 32: 4.

both men and women, men still dominate positions overall (Solsvik and Fouche 2013).

One area in particular in which women have seen success is film. Of feature fictional films in 2014, more than 50 percent of key staff (screenwriter, director, producer) were women, with 34.4 percent in documentaries and an impressive 61.3 percent in short films (Mitchell 2015). These figures are dramatically up from previous data collected around 2010. By the numbers, women in film (production) fare far better than their counterparts in the United States as well as many parts of Europe. The next step on the agenda of feminist filmmakers is to disrupt the androcentric culture of film to include perspectives not

only from men or a male point of view but from that of women and minorities as well.

Mirroring the gendered division of labor, women's wages in the education sector make up 95 percent of men's, whereas it is significantly lower in the financial sector, with women making only 71 percent of that of men. Overall, it is estimated that women average 86.4 percent of a man's monthly wage; when looking at annual incomes, this number falls steeply to a mere 67 percent. This drastic difference is due to less women than men being in the labor force, as more women than men are part-time, and a large percentage of pensioners on a (minimum) state retirement are women (Statistics Norway 2015a). These numbers decrease even more between that of women and men when bonuses, commissions, and overtime were incorporated (Statistics Norway 2010). It should be noted that, mirroring the racial makeup of Norway, this number represents white women and does not reflect the differences, if any, for women of color.

Informal Labor

Although it is hard to find exact statistics on the number of women employed in informal labor positions, the *Global Gender Gap Report* shows that the number of minutes spent on unpaid work daily by men and women is fairly even, with women only working approximately 30 minutes more than men (WEF 2015). There is no information in regard to the actual type of work being done.

Family Life

Although family still plays an important role in the lives of many Norwegians, the overall structure of what exactly constitutes a family has changed since 1990. Priding itself on being a child-friendly country in which a happy family life is very important, equal and adequate care for children takes center stage in many ways. Nonetheless, following a postwar boom of sorts, nuclear families have been on the decline as marriage and divorce rates continue to flux. It is estimated that approximately 41 percent of households are now single-headed homes, and 6 out of every 10 children born are born outside of marriage (Statistics Norway 2015a). This, paired with changes in marriage and divorce ratios, ongoing concerns with LGBTQ rights, and an increase of women choosing education first have caused the more 'traditional' families to see an overall decline.

Marriage and Divorce

A decrease in the number of couples choosing to get married paired with an overall increase in divorces has contributed significantly to the number of single-headed households, but this is not the only cause. Recent studies have shown that an increase in the number of individuals who are choosing to cohabitate without getting married has also played a significant role. As of 2014, an estimated 27 percent of all couples were living together, increasing by 11 percent since the 1990s (Statistics Norway 2015a).

Despite the decrease in nuclear families, a majority of cohabiters have children, and in the case of divorce, it is often mothers who obtain parental rights. By having such a strong emphasis on family life and children, Norway is one of few countries that has made state-run child care part of federal regulations. For those who choose not to take advantage of this program, a cash benefit arrangement is given. It is often women who make use of this benefit, as they still are responsible for the majority of tasks and responsibility in regard to family care. Despite many men and women sharing household chores and family care more equally in comparison to other nations, women still find themselves spending more time on unpaid labor than men. As a way to strengthen the bond of a father to his child(ren) in an effort to combat this chasm, 10 weeks of parental care are reserved accordingly for fathers.

LGBTQ Families

As of January 1, 2009, Norway officially made it legal for all persons, regardless of sex to join in marriage (Government.no 2007). This was in addition to LGBTQ individuals having gained the (legal) right to registered cohabitation dating back to 1993.

Although legally sanctioned by law, it was left up to the church whether to accept or hold same-sex ceremonies. As of November 2015, the Church of Norway finally came to a unanimous vote to allow same-sex weddings. As part of the decision, individual priests are allowed to decide whether they want to participate in the ceremonies; the effects of the ruling are not expected to go into effect until 2017 (Zaimov 2015). Making up a significantly smaller portion of parishioners in Norway, the Roman Catholic Church still regards marriage solely as that between a man and a woman.

Nontraditional Families and Adoption

Nontraditional families, including single-headed households, are on the rise in Norway. One reason for this may

be less of a reliance on marriage as a means for support for women and their children. Norway has a stable welfare system in which women and their children are supported regardless of actual ties by marriage.

Although recent laws concerning adoption have also allowed for couples, as well as single-headed households, to foster and adopt children regardless of gender or marital status, single mothers (and fathers) still have to meet additional criteria.

Politics

Norway is a constitutional monarchy with King Harald V taking the role as the current (ceremonial) head of state and Erna Solberg holding the current position of prime minister. An additional parliament was established in 1964 to specifically address matters of importance to the Sami. Overall, women fare quite well in government and political representation. In addition to gender quota laws, most political parties voluntarily apply the gender quota system as well.

Participation and Roles in Government

Norway has seen an increase in women voters since the mid-1980s, with women voting more often than men and young women, in particular, making up a large percentage of those who go to the ballot box. In addition, around 40 percent of Parliament is female, with 7 women serving as Supreme Court justices (out of 19) and 9 (of 18) as heads of government ministries (U.S. Department of State 2013). The current prime minister, Erna Solberg, is also female. Fairing slightly better as far as representation goes, the current Sami parliament is headed by Aili Keskitalo and consists of approximately 49 percent women (Statistics Norway 2013). This is the first time in Norway's history that both the Norwegian and Sami parliaments were simultaneously headed by women.

Feminist Movements (Include Protests)

In 1913, by granting women the right to vote, Norway became the first independent country in the world to grant universal suffrage, 15 years after men. The right to vote and the Norwegian woman's movement were largely spearheaded by Gina Krog and the Woman's Suffrage Association, which was established in 1885. After gaining the right to vote, women quickly took to trying to get women into elected offices. While various branches and feminist

Sámi Women, the Indigenous Women of Europe

Sámi women have actively worked toward political equity and power within colonizing states since Elsa Laula Renberg founded the first Sámi women's organization in 1910 and collaboratively organized the first cross-border Sámi meeting in 1917. *Sámi* refers to Northern Europe's indigenous people who live across Sápmi, a region now divided between Norway, Sweden, Finland, and the Russian Kola Peninsula. At the beginning of the 20th century, Laula Renberg, a revolutionary and visionary, identified the colonizing impacts Scandinavian governments had on Sámi peoples. In response, she sought to unify a linguistically, culturally, and geographically diverse people to demand their rights to land and culture.

Today, Sámi women continue to co-lead political organizing via their democratically elected positions in the Sámi parliaments established in Norway, Sweden, and Finland to represent Sámi interests at the national level. At the beginning of the 21st century, Sámi women comprise almost half of their respective parliaments.

However, equal political representation is not equivalent to equal political power, argues Rauna Kuokkanen (2014). Women rarely lead political committees, their opinions can be subtly trivialized, and few are selected as board members to key Sámi organizations. Further, colonial laws that affected Sámi women's inheritance and property rights continue to marginalize their participation in traditional economic activities, including reindeer herding.

The image of the strong Sámi woman, exemplified by activist and politician Elsa Laula Renberg (1877–1931), is both reality and stereotype. Sámi women participate in leadership; yet, they are silenced when the lasting impacts of colonialism and patriarchy on Sámi gender relations are not critically interrogated.

—Amanda S. Green

Kuokkanen, Rauna. 2014. "Gendered Violence and Politics in Indigenous Communities." *International Feminist Politics* 17.2: 271–288.

organizations still exist today, they are not as prominent simply because of recent changes of state law and policy in the last few decades that specifically focus on garnering rights for women in the name of equality.

The Kindergarten Act is one such law that came out of Norway's attempt to better the lives of mothers and children that many so-called feminists have taken issue with. By granting cash benefits to the parents of one- and two-year-olds who are not in nursery programs, opponents worry that the already gendered structure of the workforce will cause more women to receive this benefit and stay home with their children, thus withdrawing from the workforce and dismantling much of the work that has previously been done to get more women working.

Mirroring similar movements in Europe and the United States, Norway also saw an increase in feminist activism in the 1960s and 1970s. Having previously focused on gaining the right to vote and placing women in government positions, the Norwegian woman's movement shifted its focus to include issues of immigration, abortion, women in work, and much more. Much like many of their "sister" movements in the United States and Europe, the Norwegian women's movement was and still is often criticized

as being a white, middle-class women's movement. This gave rise to the appearance of various other groups, such as workers and indigenous rights groups.

Currently, the women's movement in Norway has become very political. Following in the footsteps of neighboring Sweden, Cathrine Linn Kristiansen will be the first Norwegian member of the Feminist Initiative Party to run for office on a completely feminist platform. The Feminist Initiative platform, as with the women's movement, aims to focus not only on issues affecting women, but also on other marginalized and underrepresented individuals (Coleman 2015).

Citizenship and Immigration

Overall, the lives of female immigrants mirror native-born Norwegian women quite closely. One of the main differences comes in the sheer numbers of immigrants and refugees that are currently in or coming to Norway. A large proportion of these individuals are still male. Where Norway does see a spike in migration of immigrant women is when these women are reuniting with spouses or their families. New residency and immigration laws currently

put on the table in 2016 would make it harder both for refugees and immigrants to not only enter but permanently reside in Norway and would cause a large fracture in the reunification of families. Despite these seemingly looming laws, a large proportion of the individuals Norway did grant citizenship to in 2014 were female. This may partially be the result of programs that specifically target and focus on the empowerment of immigrant women with low educational and working backgrounds.

Armed Forces

As of 2015, the Norwegian Army had widened its recruiting range to include not only men but women as well. Parliament overwhelmingly voted in favor of opening up Norway's mandatory conscription laws to both sexes. Previously, it was only 17-year-old boys who would receive conscription letters asking them to complete a short survey used to identify those qualified for duty. Now, 17-year-old girls across Norway will be receiving the same letters. This does not mean all women will have to serve in the army; likewise, with boys, only a portion will get past the questionnaire, interview, and physical and psychological exams to make it to training. By doubling the search pool, the army will essentially only be taking "the best of the best." In doing so, they aim to shut down naysayers who view women as not being strong or powerful enough to serve in the military. Although mandatory conscription for women is something new, women in the military is not. Norway has allowed female volunteers since around 1980 and includes women at every level of service (Braw 2015).

Additionally, Norway has unveiled a new plan that would call for the inclusion of more women in peace discussions. The new plan, titled Women, Peace, and Security, recognizes the importance of having women involved in the decision-making process, especially in times of war and armed conflicts, as a way to better protect women and girls.

Antidiscrimination Law

While Norway currently has laws that address issues of discrimination on the basis of gender equality and sexuality, among others, a recent proposal has been made to combine all current antidiscrimination laws into a larger, more comprehensive framework. This would include filling current gaps in which transgendered individuals are often left out of antidiscrimination doctrine. Such laws, paired with the newly updated Gender and Antidiscrimination

Ombud, have put in significant work in making sure individuals of varying identities are protected from all forms of discrimination.

The Equal Status Act, Marketing Control Act, and Consumer Ombud have all played a significant role in the lives of women, with particular regard to representation in advertising. All three plans include specific regulations that are set up to hinder discrimination based on sex in advertising. Regulations under the acts work together to ensure equality between the sexes, with particular regard to advertising, by banning material that portrays women (or men) in a derogatory or offensive manner. Although wonderful in theory, there has been some criticism of said plans because they do not allow for direct input from consumers in determining what constitutes derogatory or offensive advertising. As such, actual interpretations of what counts as "sex-discriminatory advertising" varies. Nonetheless, in adopting such policies, Norway is one of the few countries worldwide that has set up laws that specifically target advertising agencies.

Religious and Cultural Roles

Norway has been and still remains a predominantly Christian nation, with more than 80 percent of its citizens members of the Church of Norway. Despite this, approximately only 12 percent are estimated to attend church services more than once a month (Samfunnskunnskap.no. 2016). Along with a decrease in traditional church service attendance, baptisms and marriage ceremonies have also shown an overall decrease. This mirrors recent efforts to further the separation of church and state and to allow religious freedom to all citizens. A recent influx of immigrants has also slightly changed the religious makeup of Norway.

Women's Roles

The women's movement has worked vigorously to get women out of the home and into work and government positions. And while more and more women have seemed to take on these roles, women and men are still typically gendered in their roles both within and outside the family. While overall men and women both take care of children at home and both take time off for the birth of a baby, it is still women who put more time into child care and other daily household duties. This feminization of women's jobs is mirrored in the workforce by the positions women hold, such as nurses, teachers, and caregivers.

As for official roles within the church, women are still few in number. Although civil law granted women the right to be ordained in 1938, it was not until 1961 that the Church of Norway officially acted on the decree by appointing a female priest. Women who were ordained were often relegated to being hospital chaplains and often found themselves in specialized roles and not strictly in the churches themselves. It was not until 1992 that Rosemarie Koehn rose high enough through the ranks to become Norway's first female bishop and only the third female Lutheran bishop worldwide. Given the church's reluctance, the number of ordained females continues to remain relatively low. Koehn and her fellow female clergy have all been very vocal in expanding the number of women in the church to act as role models for female churchgoers and the community at large. Despite positive views on the inclusion of more female clergy and with a new decree allowing same-sex marriages within the church, some clergy, both male and female, remain hesitant on the matter. Hilde Raastad, a priest of 18 years who identifies as lesbian, left the Church of Norway in 2013, citing homophobic attitudes and practices as her main reason (The Local 2015)

Religious Laws

Despite women still holding traditional roles of wife and mother, more women are stepping outside or bending the rules of traditional marriages. One way women do this is by keeping their surname or hyphenating the surnames of their children to reflect both the line of the mother as well as the father.

Norse Mythology

Although much of Norway is Christian, Norway and other Northern European countries share a complex and interesting history within the world of Norse mythology. Mostly known as the "Viking religion," Norse mythology consists of many gods and goddesses and the stories of their various encounters among worlds. Frigg, the earth mother and queen of Asgard, is probably one of the best-known female goddesses because of her marriage to Odin, the king of Asgard. Freya, the goddess of love, is also well-known and has many stories told about her beauty. The Norwegian word for *Friday*, *Fredag*, is said to have derived from either *Frigg* or *Freya*. The Valkyries, those who choose the slain in battle, also play a prominent role in Norse mythology. The Northern Lights in fact are said to be a reflection off

the armor of the Valkyries as they ride between earth and Asgard, performing the duties given to them by Odin.

Celebrations

Midsummer is a time in Norway in which many celebrate the height of summer and longer sunshine-filled days. Celebrations typically run from June 23, the longest day of the year, all the way through late July. Midsummer's Night, St. John's Day, or Jonsok, are just a few of the various names the celebrations have received. Midsummer celebrations began with early pagan traditions. Many of the activities centered on fertility and the birth of new life. Women would dance around the maypole while girls looked for flowers to put under their pillows at night in hopes they would dream of their future husbands. While still incorporated into celebrations today, many typically center on bonfires and good food with friends and family.

Issues

Sami

The Sami people are the group of inhabitants indigenous to Northern Europe. While exact census data is not collected for the Sami, recent estimates place the current Sami population in Norway at around 60,000 (CIA 2016).

Although Sami is an official language in nine municipalities, the Sami language is still in danger of becoming extinct. Although outright discrimination is seemingly outdated, many Sami continue to site institutional discrimination and the lack of Sami-speaking officials as ongoing issues. As previously mentioned in the "Education" section, curriculum and textbooks in the Sami language with a focus on Sami traditions and history are provided by the state as a way to curb this. Land rights are also of importance to the Sami people, as they continue to try and navigate laws surrounding property rights and "right to use" laws.

Transgender Rights

Although members of the LGBTQ community generally fare equally well both socially and under the law, transgendered individuals still face discrimination. Currently, laws in Norway make changing one's official name quite easy, but legally changing one's gender still faces larger, problematic medical discourses on sex and gender. To legally change one's gender, individuals must undergo a full sex-reassignment surgery.

To reach a level in which sex-reassignment surgery is “recommended,” individuals must obtain a psychiatric diagnosis of “transsexualism.” Patients who suffer from mental illnesses and depression or are viewed as being overage (read as “too old”) are often denied this recommendation. The procedure is also only conducted at one location nationwide, the Oslo University Hospital, adding an extra degree of difficulty for individuals who wish to have the surgery performed. Such a surgery would also inflict nonreversible sterilization. Many transgender rights advocates both locally and globally have argued against the medicalization of gender in regard to personal identification. Amnesty International in particular has been heavily critical and recently petitioned Norway’s minister of health, Bent Høie, to step up and make significant changes in the laws concerning transgender individuals.

Seemingly taking said advice, as of June of 2015, members of the Norwegian government proposed a law that would allow individuals as young as 7, with parental consent, to legally change their gender. Under the proposed new law, any individual age 16 or above would be able to apply (themselves) for a legal change in gender. Not only would the law allow for greater personal agency in terms of self-identification, but it would also separate the decision from the medical establishment, no longer requiring a medical or psychiatric diagnosis. Nonetheless, the new law would only affect legal documents.

As of 2013, transgendered individuals also find themselves vulnerable under the absence of gender as a category under current laws regarding hate crime and hate speech. Although overall hate crimes are rarely reported, the National Police Directorate urges that this is due to underreporting based on a lack of clarity on the behalf of officers on a national definition of “hate crime.” The Oslo Police Department, in an effort to try to combat such crimes, recently released a clear definition of hate crime, including offenses based on gender, and established a specialized hate crime unit. The rest of the country has yet to follow suit and has been the target of much negative attention from the United Nations in their perceived lack of effort in increasing efforts to fight hate crimes.

Violence against Women

While Norwegians are officially protected by the law against harassment, assault, domestic abuse, and rape (including spousal rape), Amnesty International and other organizations have been critical of the way the Norwegian

government and police have so far handled reports and cases of violence against women. According to Amnesty International and a national study conducted on the prevalence of rape and sexual violence, nearly 1 in 10 women in the study reported having been raped. Out of cases reported, 8 out of 10 were eventually dropped and never fully prosecuted (Amnesty International 2016). Another report in 2014 stated that 87 percent of all victims of sexual offenses were women, and women made up 2 out of 3 victims of ill-treatment within the family (Statistics Norway 2015b). Rape and violence continue to be very gendered, and cases often go unreported.

While the law requires all police districts to have domestic violence coordinators, reports show that many do not. In addition, recent shifts in funding from the federal level down to municipalities has forced budget cuts and shelter closures, making women less likely or less able to seek help in this way.

Nonetheless, Norway continues to support combating violence against women with ongoing action plans that specifically focus on these topics as well as forced marriages and female genital mutilation and circumcision (FGM/FGC) both locally and abroad. Norway is currently signatory to all international and UN sanctions that focus on ending violence against women. The Norwegian government has specifically dedicated around 26 million kroner (roughly USD\$3 million) to sponsor shelters, counseling, and other support services for victims and survivors of violence in various countries around the world (European Economic Area and Norway Grants 2014).

P

Poland

Overview of Country

The Republic of Poland is a country in Central Europe. It is situated between the Baltic Sea in the north and the Sude-ten and Carpathian Mountains in the south. The neighbor- ing countries are Germany, the Czech Republic, Slovakia, Ukraine, Belarus, Lithuania, and the Russian province of Kaliningrad Oblast. The area of Poland is 120,000 square miles (312,000 sq. km). It is the 70th-largest country in the world and the 9th-largest in Europe (GUS, Central Statis- tical Office 2011b.).

Poland is a representative democracy with a president as head of state. In 2004, Poland became the part of the European Union. Since the opening of the labor market in the European Union, Poland has been experiencing mass emigration.

Poland country is rather homogenous regarding nationalities—less than 3 percent of the total population is a minority. It is inhabited by nearly 38.5 million people, including nearly 7 million children and adolescents aged 17 years and younger, which accounts for more than 18 percent of the total population (GUS, Central Statistical Office 2014b). For every 100 men, there are 107 women. Differences in the numbers of men and women become more apparent in older age groups. For 65- to 84-year-olds, there are 100 men for every 154 women, and in the age

group 85 years and older, there are 100 men for every 284 women (GUS, Central Statistical Office 2014b).

The UN Development Programme (UNDP) ranked Poland 66th out of 187 nations based on the Gender Ine- quality Index (GII) (UNDP 2014).

Structure of the Population

According to the 2011 national census, more than one- third of men (older than 15) are bachelors; however, the percentage of unmarried women is much lower. Less than one-quarter of women are unmarried (GUS, Central Sta- tistical Office 2011a). Women at the time of marriage are on average two years younger than men. The law in Poland allows for the marriage of women under 18 years of age, while a man must be at least 18 years old). The proportion of married men is slightly higher (58%) compared with married women (54%). The proportion of divorced women is higher (nearly 6%) compared with divorced men (4%).

There is a phenomenon of higher male mortality, which causes more frequent widowhood of women. As a result, older men remain married to the end of their lives, while older women are often widows. The percentage of widows in Poland is five times higher (more than 15%) compared with the percentage of widowers (3%). In all age groups, widows outnumber widowers. For people age 80 and over, 80 percent of women are widows (GUS, Central Statistical Office 2011a).

Girls and Teens

There is a predominance of boys among children and adolescents up to age 17. For every 100 boys, there are 95 girls. Girls aged 10–19 years make up 12 percent of the Polish population (GUS, Central Statistical Office 2014b).

In the early 2000s, the scope of extreme poverty among children and adolescents below 18 years of age reached approximately 10 percent (UNICEF 2012).

The life satisfaction of Polish children is the lowest in the group of countries in the Organization for Economic Co-Operation and Development (OECD Better Life Index 2015). Girls have lower life satisfaction than boys, and they display repeated, subjective complaints more frequently (Mazur 2015). Also, fewer girls than boys perceive their weight as normal (36% of girls to 48% of boys); one out of four girls of normal weight is on a diet.

Nearly 35 percent of all teenagers begin drinking alcohol at the age of 13 or younger, and 14-year-old girls declare that they have been drunk at least once. More than 18 percent of 14-year-old girls have a history of sexual activity. Also, the percentage of girls involved in fights has increased since 2000 (Mazur 2015). However, girls are more often victims of bullying and cyber violence. Nearly 10 percent of girls have experienced being a victim of nasty jokes and embarrassing photos posted on the Internet (Komendant-Brodowska 2014).

Structure of the Education System

Education in Poland starts at the age of 6 and is mandatory until the age of 18. It is free of charge in public schools. The education system comprises preschool institutions as well as primary, lower secondary, upper secondary, and post-secondary schools.

The primary school (*szkoła podstawowa*) lasts six years, and the lower secondary school (*gimnazjum*) lasts three years. The upper secondary school (*szkoła średnia*) may last three or four years, depending on the type of school. There are five types of upper secondary schools: three-year general upper secondary school (*liceum ogólnokształcące*); three-year specialized upper secondary school (*liceum profilowane*); four-year technical upper secondary school (*technikum*); three-year basic vocational school (*zasadnicza szkoła zawodowa*); and three-year special schools for pupils with disabilities and special educational needs (*szkoła specjalna*).

At the end of the general and specialized upper secondary school, as well as technical upper secondary school,

pupils take the external matriculation exam (*matura*). Upon passing the exam, they receive the matriculation certificate (*świadectwo maturalne*).

The graduates of the upper secondary schools in Poland who hold the matriculation certificate have a wide variety of educational possibilities. College programs and degree programs are provided by both public and private universities. The degree programs include three-year programs (bachelor's degree), two-year programs (master's degree), and five-year programs (master's degree).

Girls in School

Ninety-nine percent of girls in Poland are enrolled in primary schools, and nearly 98 percent are in secondary schools (GUS, Central Statistical Office, 2014). Girls in primary schools account for nearly 49 percent of total graduates, and this figure does not change in lower and upper secondary schools (GUS, Central Statistical Office 2015c). The statistics for girls and boys are different only when taking into account the type of school. For example, girls are nearly 62 percent of total graduates in the general secondary schools. Also, girls are the majority of graduates of general art schools, at 76 percent (GUS, Central Statistical Office 2015c).

Sexual Education

Since 1999 and the reform of education, sex education has raised many questions. There has been a big debate about what should be taught and who should teach children when it comes to sexuality. Research has shown that young people do not talk with parents about the issues of sex and sexuality. Classmates and teachers are the main sources of information for youth. Parents are the third source of knowledge about sexuality (IBE 2015). Research has also indicated that young people in Poland do not know much about their psychosexual development and sexuality. Sex educators have noticed a “pregnancy paranoia” among teen girls (Ponton Summer Hotline for Teens 2015). Therefore, there is a need for sexual education that is ideologically neutral and based on scientific and pedagogical competence.

Education

Women in Poland receive a majority of secondary school diplomas and enter education at universities more frequently than men (Ministry of Science and Higher Education 2013). The number of female students is greater than

the number of male students; in 2014, women accounted for nearly 60 percent of all students in Poland. Also, 64 percent of them graduate with a master's degree. More women also undertake technical studies; it is estimated that nearly 40 percent of the students in polytechnics are women (Ministry of Science and Higher Education 2013). Women also enter doctoral studies (54%) more frequently than men. However, the former minister of science and higher education, Professor Lena Kolarska-Bobińska, says, "Women make up only 21 percent of professorship. . . . Among heads of large universities there are only 13 percent women" (Kolarska-Bobińska 2014). Therefore, women, despite their educational potentials and competencies, are not promoted as quickly as men. Women still face a glass ceiling.

For women in Poland, there is no age limit when it comes to education. The Universities of the Third Age, which offer extended learning opportunities worldwide, mostly to retired or semiretired people, bring together tens of thousands of learners, most of whom are women.

Several fields of education in Polish universities have a high level of female participants—in particular, education, medicine and health, social work and welfare, life science, the humanities, social science, and the arts (Ministry of Science and Higher Education 2013). These fields are more likely to prepare women for lower-paying professions. This also applies to the teaching profession. A report shows that Polish teachers are some of the lowest-paid teachers the OECD countries (OECD 2014). Nearly 82 percent of teachers in Poland are women (GUS, Central Statistical Office 2015c).

Health

The health care system in Poland has been in a state of crisis for many years, even though the constitution states that everyone has the right to health and citizens are granted equal access to the publicly funded health care system (particularly free health care should be provided to young children, pregnant women, disabled people, and the elderly). However, there have been issues with the access to public specialists. Scheduling a treatment at a public hospital can take up to three years. Therefore, according to the European Health Consumer Index, Poland ranks at the bottom of the list (Health Consumer Powerhouse 2014).

Maternal Health

Poland occupies the 25th position among EU countries (of which there are 27) in terms of fertility rate; the average

rate in Poland is 1.29 children per woman, and in EU countries, it is 1.55 (Eurostat 2015). The low level of fertility is due to several reasons. The economic situation influences the fertility rate. According to Eurostat analysis, there is a link between the decline in fertility rates and factors such as gross domestic product (GDP), consumption, and the unemployment rate. GDP decline often correlates with a subsequent decline in the fertility rate. Likewise, a rising unemployment rate is usually associated with a decline in fertility. A rise in consumption is associated with a rise in the number of births (Lanzieri 2013).

Because of Polish migration to the United Kingdom after 2004, the birth statistics of Poles are relatively high outside Poland. More and more Polish children are born in the United Kingdom; in terms of the number of births, Poles are the largest national group among foreigners. According to data from the Statistical Office of the United Kingdom, in 2014, Poland was the most common country of birth for mothers who were not born in the United Kingdom (Office of National Statistics, 2015). Women from Poland gave birth to more than 3 percent of all live births in 2014 in United Kingdom.

In Poland, the median age of women giving birth is 29 years, and the average age of first birth is 27 (GUS, Central Statistical Office 2014b). The youngest mothers are girls aged 12 years (sporadic cases once every two years), while the girls giving birth at ages 13–14 years old account for approximately 50–60 cases per year. In 2014, children born to adolescent mothers (19 years old and younger) accounted for 3.5 percent of all births. The adolescent birth rate is 12 births per 1,000 girls aged 15–19 (UNDP 2015). The life expectancy at birth is 81 years (UNDP 2014).

Diseases and Disorders

Most women who are 50 years old and older experience deterioration of the quality of life due to health reasons. In the older age group (over 70), health problems apply to almost all women. Statistically, for every woman in Poland, there is an average 1.7 chronic diseases (per man it is 1.2). These diseases are joint disease, thyroid disorders, liver (hepatic) disease, gall stones, allergies, and neuroses. Women more often than men complain of the presence of negative symptoms of mental health—constant fatigue and depression. Depression problems (feelings of sadness, discouragement, loss of interest) lasting several days or longer apply to one in three adult women (nearly 36%). The frequency of complaints of depressed mood increases

with age, reaching the highest in the 40–49 and 50–69 age groups (GUS, Central Statistical Office 2015d).

When considering hospitalization, women are hospitalized more often than men. However, this is not fully correct. Almost all young Polish women give births to babies in hospitals; delivery care is 99.9 percent (GUS, Central Statistical Office 2014a). Therefore, in the 20–39 age group for both men and women, hospital care among women is higher than for men.

Apart from pregnancy and childbirth, the other causes of women's hospitalization are related to the treatment of tumors and cardiovascular disease. Other causes of hospitalizations are due to gastrointestinal and urogenital diseases. Women, more often than men, are treated in hospitals because of endocrine disorders, diseases of the nervous system or the eye, and diseases of the musculoskeletal system (Ostrowska 2014; GUS, Central Statistical Office 2015d).

Cancer Problem

The number of cancer cases since 1990 has doubled in Poland, reaching more than 140,000 cases in 2010, of which half concerned women (Potrykowska et al. 2014). Women mostly develop breast cancer (Ostrowska 2014). The other common cancers are colorectal tumor (10%) and lung cancer (9%). These are followed by uterine tumor (7%) and ovarian cancer (5%). Most cancer cases occur after the age of 60 (70% of cases in population of men and 60% of cases in women). The mortality of malignant neoplasms in Poland is higher than the average for the European Union. It is about 20 percent higher for men and 10 percent higher for women (Ostrowska 2014).

Since 2006, prevention programs have been implemented nationwide. Two of them are dedicated to women in certain age groups. Programs for early diagnosis of cervical cancer are intended for women in the 25–29 age group. For them, it is advisable to perform cytology—a diagnostic test for cancer—once every three years. Programs for early detection of breast cancer are intended mostly for women in the 50–69 age group, which has the highest risk. For these women, it is advisable to have a mammogram once every two years. These prevention programs also include pap smears and mammograms, educational actions, and advertising spots on television, the Internet, and radio. Education and prevention as well as support for women who suffer from breast cancer are distributed by nongovernmental organizations (NGOs), including the Amazon Association, which was founded in 1993.

HIV/AIDS

According to the National Institute of Public Health in Poland, since the beginning of 1985 to the end of 2013, nearly 19,000 cases of HIV infections and more than 3,000 AIDS cases have been reported (Niedźwiedzka-Stadnik, Pielacha, and Rosińska 2015, 381–384). Every year, there has been 13 percent increase in the number of new infections. From 2010 to 2013, the average infection rate among women was nearly 1 per 100,000 (nearly 5 per 100,000 among men) (Niedźwiedzka-Stadnik, Rosińska 2015).

People who have been diagnosed with HIV infection are generally between the ages of 20 and 29 and 30 and 39 (AIDS w Polsce 2015). The most common route of HIV transmission is sex between men, followed by heterosexual contact, and then the use of intravenous drugs. However, there is a lack of data regarding the likely route of infection related to approximately 62 percent of infections (AIDS w Polsce 2015).

Deaths

The most common causes of death of women in Poland are diseases of the circulatory system, which is more than 51 percent of all deaths among women, compared with almost 41 percent among men (GUS, Central Statistical Office 2015c). The second most common cause of death is cancer; nearly 24 percent of women die of cancer. Most deaths are caused by breast cancer, colorectal cancer, and lung cancer (GUS, Central Statistical Office 2015c). Other causes of death are diseases of the respiratory system (more than 5% of women) and diseases of the digestive system (nearly 4%).

Women commit suicide less often than men; it is less than half of 1 percent of all deaths for women (for men, it is nearly 3%). Most suicides are committed by people in the 30–49 age group (almost 35%).

Abortion

There is no legal abortion in Poland. In 1993, the Polish Parliament introduced the antiabortion law called the Family Planning, Human Embryo Protection, and Conditions of Permissibility of Abortion Act. According to this act, abortion on social grounds was delegialized. Abortion may be performed only by an obstetrician or gynecologist in three instances: the pregnancy poses a threat to the life or health of the pregnant woman (without limitation

due to the age of the fetus); prenatal tests or other medical indications show a high probability of a severe and irreversible fetal defect or incurable illness that threatens the fetus's life (until it reaches the point of viability); or there is a reasonable suspicion that the pregnancy was a result of an offense (up to 12 weeks from the beginning of pregnancy). The prohibition does not lead to a reduction in the number of abortions; it only means there are a reduced number of procedures that are safe for women. The Federation for Women and Family Planning claims that in Poland every year more than 100,000 abortions are performed. Likewise, pro-life organizations claim there are only 7,000–13,000 abortions (Federation for Women and Family Planning 2013). Women in poor financial conditions who usually cannot afford to purchase contraceptives are more likely to have an unwanted pregnancy. Research shows that one in four adult women in Poland have had an abortion (Federation for Women and Family Planning 2013).

Because the socioeconomic grounds for abortion are banned, underground and private abortion services are robust in Poland, as is “tourism” abortion—traveling to other countries where the law does not prohibit abortion. Women in an unwanted pregnancy often go to Germany, the Czech Republic, the Netherlands, Austria, Great Britain, or Slovakia. Therefore, it is impossible to estimate the scale of the abortions being carried out in Poland.

Another method used by women who seek to terminate a pregnancy is a pharmacological abortion—miscarriage by medication. An organization called Women on Waves, a Dutch pro-choice nonprofit organization for reproductive health services, particularly nonsurgical abortion services, publishes Polish-language information about medical abortion (Women on Waves 2015).

On October 3 and 24, 2016, and on March 8, 2017, there were “black protests” in Poland—nationwide protests of women as a sign of opposition to anti-women government policy, particularly in the case of attempts to exacerbate abortion law. Women's strikes took place in over 140 towns and villages in Poland. According to police data, on October 3, 2016, there were 143 “black protests” in the country, involving 98,000 participants (wp.pl 2016). On March 8, 2017, women were again on the streets of Poland to remind politicians of women's rights. The International Women's Strike was a continuation of the “black protests” in October 2016. The strike was followed by the slogan “Solidarity is our weapon” (strajkkobiet.eu 2017).

Contraception

Unwanted pregnancies are often a result of a lack of reliable education in schools, lack of counseling on family planning, or the lack of effective access to contraceptives. Modern hormonal contraceptive pills are unavailable for many women because of various reasons, one of which is the cost: there is no health care reimbursement for contraceptives. Also, the so-called morning-after pills are not refunded, and their prices are relatively high. Furthermore, gynecologists in Poland can refuse to prescribe contraceptives because of the “conscience clause.”

In April of 2014, a gynecologist and a director of a hospital in Warsaw refused to perform an abortion on a seriously deformed fetus, citing the conscience clause. The doctor did not advise his patient on where else an abortion could be performed. The baby died a few days after birth. The doctor has not been charged for refusing to perform the abortion (the prosecutor decided that the doctor did not break the law) (Siedlecka 2015).

About 3,000 doctors in Poland have signed a “Declaration of Faith” (conscience clause), claiming that they are believers and that they consider abortion (as well as birth control, in vitro fertilization, and euthanasia) to be against their faith. They refuse to perform abortions, even if there are serious medical indications.

Employment

The situation of women in the labor market is different and often worse than that of men. Women usually work in other occupations and fields than men. The salaries and working time also are different for women and men. These differences are mainly conditioned by gender (GUS, Central Statistical Office 2014).

The level of economic activity of the population in Poland differs according to gender. General statistics show that women are still less economically active than men. While the proportion of economically active men is nearly 65 percent, this level is 55 percent for women (GUS, Central Statistical Office 2015b). However, economically active women have a higher level of education than men; almost 80 percent of working women have at least a secondary education, compared to 60 percent of men.

Most people in Poland, almost 58 percent, work in the service sector. The most feminized sectors of the national economy are health care and social services as well as education (GUS, Central Statistical Office 2015b). The most common type of employment in Poland is a fixed-term

contract; 47 percent of women and 53 percent of men work on fixed-term contracts. Among employees with part-time contracts, women dominate, in particular women aged 25–34 (GUS, Central Statistical Office 2015b).

Small Changes

Women in Poland are becoming increasingly more independent economically. During the early 2000s, there was a growth of women among professions and positions that had been traditionally dominated by men (doctors, lawyers, and executives). Poland has a rather high percentage of female employers and self-employed among the total number of women who work. There is no shortage of entrepreneurial women in companies that dominate in health care, education, catering, real estate, and other services (Lewiatan 2014; European Commission 2014).

Unemployment

The unemployment rate for women is higher than for men (GUS, Central Statistical Office 2015b). It is hard for women to return to work after a long break, particularly after maternity leave. According to statistics, women, regardless of their level of education, predominate among the unemployed population. The unemployment rate for people with higher education is nearly 4 percent for men and 5 percent for women, while among people with a lower secondary education, these rates account for 18 percent and 20 percent, respectively (GUS, Central Statistical Office 2015c).

Taking into account a group of economically active women, the highest rate of the unemployment concerns young women of reproductive age (25–34 years). Concerning the economically inactive women, the highest rate concerns those aged 55 and older (82%) (GUS, Central Statistical Office 2015d). Those most at risk for unemployment are service and sales workers (78%), office workers (71%), specialists (67%), and technicians and associate professionals (57%) (GUS, Central Statistical Office 2015c).

Pay Inequality

The inequality in pay between men and women is often the subject of public discussions, even though many women are still afraid to talk about injustice and inequality, including unequal pay. Women's salaries are usually lower than men's. The average salary of women is 16 percent below the average salary of men (GUS, Central Statistical Office

2015c). The difference is particularly evident in the senior executives' salaries.

Family Life

In nationwide surveys, Poles declare that the family is the most important thing for them. However, in the early 2000s, the model of the family has changed. Also, the romantic myth of the Polish woman who devotes her life to the family and the upbringing of children in the spirit of traditional values—known as a “Pole Mother/the Polish Mother” (*Matka Polka*)—has been openly criticized (Graff 2014). The most common structure now is a three-person family—two parents and one child. Families with one child are the majority in Poland (GUS, Central Statistical Office 2011a).

According to the 2011 national census, the largest group is married couples with children, at 53 percent, while informal partnerships with children account for nearly 2 percent. Married couples without children are 14 percent, and informal partnerships without children are nearly 1 percent of the total population in Poland. Single parents account for almost 14 percent (GUS, Central Statistical Office 2011a).

Single Mothers

Most single parents are mothers with at least one child (single fathers are 2% of all families). Single parents raise one in five children aged 24 years and younger. They are one-sixth of the population in Poland. The economic situation of these families is rather complicated. The single-parent households have the lowest disposable income, at 67% of average income. Many single-parent families live at risk of poverty (GUS, Central Statistical Office 2011a).

Time Budget

Gender is an important issue when considering time spent at home. Unpaid domestic work is still mostly the domain of women and girls. Women spend an average 4 hours and 33 minutes on housework daily, while men spend 2 hours and 28 minutes on housework (GUS, Central Statistical Office 2013).

These proportions change when considering time spent resting during the day. In this case, men predominate. They devote more time for rest than women—21 percent for men compared to 18 percent for women. Similarities in time budgeting can be seen when comparing girls to boys up to 13 years of age. Girls spend more time on housework than boys, and boys spend more time during the day resting (GUS, Central Statistical Office 2013).

Women's Voices

Ewa Kopacz

Ewa Kopacz was born in 1956 in Skaryszew, in the Radom region of Poland. She did not embark on a political career when she graduated from the faculty of medicine at the Medical Academy in Lublin, but instead, between 1998 and 2001, she served as the Mazovian Regional Assembly councillor. This was the first of many appointments as MP of Sejm, holding the role of Health Committee chair, Civic Platform deputy chair, minister of health, and ultimately speaker. In 2014, she was named prime minister, Poland's second woman to serve in this capacity.

Criticized for promising to respond "like a reasonable Polish woman" (Cadei-Ozy 2014), Kopacz quickly turned the conversation around in her inaugural speech, in which she spoke of pragmatism, solidarity, and family values. She is credited for managing her party's infighting and for leading dialogue around issues of importance to her people, such as quality of life and earning a living wage. In 2016, her approval rating was just over 46 percent, and she continues to gain the support of the Polish people. She was ranked 40th on the *Forbes* list of 2015 Power Women.

partnerships and same-sex unions in Poland. Although Poland was one of the first countries to avoid punishing homosexuality in the early modern era, same-sex couples and households headed by same-sex couples are not eligible for the same legal protections available to heterosexual couples.

The Eurobarometer found that only 28 percent of Poles think same-sex marriage should be allowed throughout Europe; 61 percent are against marriages of homosexual couples (European Commission 2015). There is social disapproval not only for same-sex marriages, but also for the legal recognition of homosexual partnerships and adoption rights for homosexual couples. This shows that LGBT persons in Poland face legal challenges not experienced by non-LGBT residents. Furthermore, the role of the Catholic Church is significant in the debate on equality issues—gender equality and LGBTI people's rights in Poland. The Catholic Church leads a campaign against what it terms "gender ideology," which probably negatively affects public opinion.

Politics

The formulation of equal rights of women and men in the Constitution of Poland guarantees the equality of women and men in family life as well as in political and social life. Although women in Poland gained the right to vote and to run for office in 1918, they were and still are a minority in politics (Druciak, Fuszara, Niżyńska, and Zbieranek 2011).

In the first parliamentary elections in which women could participate (1919), the Parliament elected eight women deputies (Federowicz 2014). They were just 2 percent of the total number of deputies in the Parliament. The achievements of these first women parliamentarians were significant legislative initiatives, such as changes to the provisions of civil law regarding women's rights, the act on the protection of women and children, and the act on combating the trafficking of women and children. There were also many projects related to the education system, modern social welfare, and trading and production of alcohol and alcoholic beverages, which later became the model for many European countries (Federowicz 2014).

In the postwar period, during the communist regime (1945–1989), the representation of women in Parliament has never reached 25 percent of all deputies. A woman has never been a head of the (ruling) Communist Party. Since 1989, when the first postwar democratic elections were held, the participation of women in the

Same-Sex Partnerships

The Polish law does not allow marriage for same-sex couples. There is no legal form of recognition of civil

government has been increasing (from 1989 until 2015 there were 3 women among 15 prime ministers). Their real influence on the country's politics is considered symbolic rather than literal (Druciak, Fuszara, Niżyńska, and Zbieranek 2011).

In the elections to the Parliament in 2015, women reached a record number in Parliament (Institute of Public Affairs 2015). They gained 27 percent of the Sejm seats (the lower house of Parliament in Poland) and 13 percent of the Senate seats (the upper house of Parliament). This is the best result in the history of the Polish Parliament in terms of women's participation in the legislature. This does not mean, however, that women's issues meet with an understanding of politicians; women's issues have not been a subject to the discussion yet. One of the proofs of this is the fact that, in 2016, the government formed by the Law and Justice (PiS) Party members did not appoint the position of the Government Plenipotentiary for Equal Status of Women and Men.

Women's Movement

The women's movement in Poland developed in the 19th century. The first women's organizations and informal or illegal groups were ideologically very diverse. There were conservative and socialist groups as well as those associated with the Catholic Church, or emancipatory women's groups. They mostly focused on patriotic goals (the independence of Poland) and were engaged in the secret teaching of Polish language. One of the first and the most recognized feminist groups in Poland was a group of *Entuzjastki* (Enthusiasts), a group of young women gathered around Narcyza Żmichowska, a Polish teacher, educator, and writer (Borkowska 1996; Phillips 2008).

Voting rights and the right to education had become the priorities for women's groups and organizations in the second half of the 19th century. The first women began to study at the university in 1896 (at Jagiellonian University in Cracow).

During the communist regime, there was one official women's organization—*Liga kobiet* (the League of Women)—that was financed by the state and controlled by the communist authorities. After the fall of communism in 1989, an increasing number of women's organizations—feminist and antidiscrimination groups—has emerged. Since 2000, the annual feminist demonstration, *Manifa*, has been held in various parts of Poland. The Women's Party was registered in 2007. And since 2009, the Women's

Congress has been held, the annual congress organized by the social movement to act on behalf of women. Important actors in the women's movement are not only organizations but also individual women who represent different ideological camps but work on improving the everyday situation of women.

Religious and Cultural Roles

The largest religious community in Poland is the Catholic Church. Almost 88 percent of the population declares affiliation with the Catholic Church (GUS, Central Statistical Office 2011a). However, the formal number of the followers of Catholicism reflects no actual religious activity of its members. Since the 1990s, the number of people participating in Sunday Mass systematically and gradually has decreased (CBOS Public Opinion Research Center 2015). Particularly people aged 18–24 have left the church, and it is estimated that nearly 6 percent of the population in Poland are atheists (Atheism in All Shades 2015).

As far as gender is concerned, women are more likely than men to declare themselves religious (GUS, Central Statistical Office 2014b). However, women's roles in the church are underestimated and usually reduced to voluntary work in Catholic counseling centers or work as catechists in schools. The Catholic Church refers negatively to the practice of the ordination of women.

Issues

As noted previously, Poland has dealt with continued issues. One of them is a problem of violence against women. There is significant influence from the Catholic Church for women to be patient and suffer in silence.

Domestic Violence and Violence against Women

In Poland, as in other countries, the real extent of domestic violence is unknown, and official statistics show only those cases that have been reported and recorded. Only about 30 percent of women have reported violence by their partners.

According to Amnesty International, domestic violence against women is the most commonly reported crime (Amnesty International USA 2015). Domestic violence affects all social groups, not only pathological ones. Police statistics show that 95 percent of perpetrators of domestic violence are men, and 91 percent of the victims are women and children (statystyka.policja.pl 2015).

Since 2000, many educational programs and prevention programs for women experiencing violence have been launched in Poland. There is an increasing number of support centers and foundations whose main goal is to help women victims of violence. The problem of domestic violence and violence against women has been discussed more frequently in the media, so there is a chance that it will no longer be taboo. Also, it is important that, in 2015, Poland formally became the 18th country to implement a convention of the Council of Europe: the Convention on Preventing and Combating Violence against Women and Domestic Violence.

Economic Violence

Violence in intimate relationships takes many forms. Economic violence is very difficult to identify due to the diversity of families. Also, some forms of violence are tolerated in society as a part of the division of traditional roles between woman and man.

The research of the Institute of Public Affairs shows that 30 percent of Poles accept restricting a partner from the use of finances, 18 percent believe that it is acceptable to prevent the partner from obtaining employment, and 17 percent justify not paying child support (Chłestowska, Druciarek, and Niżyńska 2015). Not paying child support is a form of economic violence. Although Poles declare a low tolerance for parents who do not pay child support, nonpayment of maintenance is a common practice. One in three fathers who have this obligation does not pay any child support (Lisowska 2013).

Sexual Violence

Sexual violence is one of the most concealed types of violence against women. The research of the International Violence against Women Survey (VAWS) discloses that about 3.5 million women in Poland have been victims of physical violence or sexual abuse at least once, and 10 percent of women become victims of rape or attempted rape every year (Gruszczyńska 2013). However, because of fear or shame, women do not always report having been a victim of sexual violence. This is confirmed by the research.

Nearly 19 percent of all cases in which a suspected rape was reported were closed without the launch of a criminal inquiry (Pietryka 2014), and 36 percent of the total number of cases ends without a bill of indictment being submitted to the court. This may raise the suspicion that the interests of victims may have not been adequately protected in such proceedings (Pietryka 2014).

LGBTI

"The population of LGBTI persons in Poland is impossible to estimate." ILGA-Europe (an EU organization that conducts research on the human rights situation of lesbian, gay, bisexual, trans, and intersex people in Europe) estimates that Poland only meets 33 percent of the EU requirements for acceptance of LGBTI people (ILGA-Europe 2015). According to LGBT Survey, 41 percent of lesbians in Poland claim that they had personally felt discriminated against or harassed on the ground of gender (2012). To the question, "Do you avoid holding hands in public with a same-sex partner for fear of being assaulted, threatened or harassed?" 56 percent of lesbians answered yes (FRA 2012).

Portugal

Overview of Country

The population of Portugal, numbering 10,813,834 in total, live in the southwest of Europe, bordering the North Atlantic Ocean to the west and Spain to the east and north. The Republic of Portugal also includes the Atlantic Islands of Madeira and the Azores archipelago, although both have autonomous governments. Portugal's identity is strongly marked by its former status as a global maritime power during the 15th and 16th centuries, and by its continuing status as an imperial power until independence was finally granted to its African colonies in 1975. Portugal was also a monarchy until 1910; subsequently, after a brief period as a republic, the country was governed by a repressive regime known as the New State until its overthrow in 1974 and the implementation of a democratic government. Today, Portugal's democratically elected unicameral Assembly of the Republic is located in Lisbon, the nation's capital.

Until the mid-20th century, the livelihoods of the majority of the population depended on subsistence farming and agriculture: today, 61 percent of the population reside in urban areas, and the service sector accounts for three-quarters of the nation's income, with industry contributing another 22 percent. The majority of Portugal's population is of largely Western Mediterranean origin. Since decolonization in 1975, citizens of black African descent have migrated to Portugal and number less than 100,000: there has also been migration from Brazil and, since 1990, Eastern Europe. Eighty-one percent of the population is officially Roman Catholic, and 3.3 percent are Jewish, Muslim, or another world religion.

Internationally, Portugal is a founding member of NATO, and it entered the European Community, now the European Union (EU), in 1986. The nation also belongs to the European Monetary Union.

The current life expectancy stands at 75.76 years for men and 82.47 years for women. The total fertility rate of 1.3 is very low, falling below the population replacement level (WHO 2014). Schooling from ages 6–18 is compulsory in Portugal and totals 12 years. As an indicator of the significant changes that have taken place since 1995, the proportion of the population enrolled at university or in possession of a higher education degree doubled from 2001 to 2011 to just more than 10 percent of the nation's total population.

Portugal is a society historically dominated by a single religious tradition of Catholicism, and it remains a strong Catholic-majority country. In the census of 2011, of those professing any religion, 95 percent identified themselves as Catholic, with other Christian denominations principally comprising the remaining 5 percent. Church and state have been separated since 1916, a principle that was reiterated with the Law of Religious Freedom, enacted in 2001, which codified equal treatment for all religions under the law. No "official" religion may be adopted or promoted by the government.

To date, the Portuguese economy and society have been greatly affected by the recent economic crisis originally triggered by the global "credit crunch," a significantly more fragile economic outlook, and subsequent structural readjustment. In common with some other nations in the European currency, Portugal was obliged to adopt the Program of Economic and Financial Assistance led by the "Troika" of the European Commission, the International Monetary Fund (IMF), and the Central European Bank. The resulting adjustments and electoral instability have impacted

women, particularly with regard to youth unemployment and difficulty in assimilating legislation and other measures intended to promote gender rights and equality.

Girls and Teens

The declining number of girls and teens as a proportion of Portugal's total population since the 1990s reflects the overall inversion of the population age pyramid: whereas, in 1970, girls were 43 of every 100 females, in 2008, this proportion had halved to 22 girls (INE 2010). The Portuguese government implemented programs with the aim of decreasing the high rate of births by teenage mothers. These programs, together with the implementation of compulsory sex education in school, may have contributed to a steady year-on-year decrease in births to female adolescents from 2009 to 2012, declining by 100 cases to a total of 3,301 in 2012 (United Nations Statistics Division 2017). Data released by the World Bank also illustrates this decline in the adolescent fertility rate: from 15 percent of births per 1,000 women aged 15–19 years in 2009 to just over 12 percent in 2012 (World Bank 2014).

Education

The total expenditure on education accounts for 5.6 percent of the nation's gross domestic product (GDP). Portugal ranks 81st in the world for its general overall literacy rate, and the female literacy rate lags by three points behind that of men. This indicates that the nation's educational attainments are still affected by the era of the New State: up to 1974, four years of mandatory education were all that was considered necessary for the majority of the population, and functional illiteracy, especially among women, was prevalent. However, enrollment in primary education is now at an equal rate between the sexes, and more girls than boys are enrolled on a stable basis in secondary education, by a ratio of 1.10 (WEF 2013, 316).

University

Women are the majority of the students enrolled at university, with just more than 60 percent of the total and nearly 15 percent of the country's female population (Comissão para a Cidadania e Igualdade de Género 2014).

As in the other Southern European countries, young people have been particularly affected by economic crisis and subsequent restructuring by European and world economic

bodies. This accounts for the sharp rise in what have been traditionally relatively low rates of youth unemployment before 2000. The unemployment rate among young women between the ages of 15 and 24 rose from 10 percent of the total number of females in this age group to just under 40 percent since 2012 (UN Statistics Division 2014).

Health

The full range of regular contraceptive methods, including emergency morning-after contraception, are distributed free of charge within the National Health Service. Until 2007, termination of pregnancy was prohibited by law, with stringent exceptions on the grounds of the mother's health, and around 5,000 women were hospitalized per year due to complications related to illegal abortions (EIWH). Abortion was decreed legal in 2007 for up to the 10th week of pregnancy.

Contraception is extensively used by married women and encouraged by a number of government-sponsored family planning campaigns: just under 90 percent of married women use some method of contraception (WEF 2013, 319). The Portuguese government has also promoted the female condom to prevent the spread of HIV/AIDS among the female population. This may have been a factor in the decrease in AIDS among women in recent years: from 1983 to 2012, the total number of female HIV-notified cases totaled 11,312, or just under 27 percent of the national total, and cases of AIDS totaled 3,343, or almost 24 percent of the national total (Jorge 2012).

The Portuguese government has invested in vaccines and other measures to prevent and reduce the rate of diseases specific to women. For example, as part of the National Health Vaccination Plan, all girls in their 13th year are inoculated against the human papillomavirus (HPV), a principal cause of cervical cancer. Almost a third of Portuguese women have a body mass index (BMI) above that classified as "normal," and more women than men are clinically obese, a ratio of 16 percent of the total female population. On the other hand, women smoke less frequently than men: two-thirds of the female population have never smoked at all, and one-third of the population who smoke are female (INE 2010).

Employment

The relatively high participation of Portuguese women in the formal employment sector can be traced to historical

factors, such as dual participation within the traditional rural system; the rise of an industrial sector based on the labor-intensive manufacturing of textiles, ceramics, and other goods, which employed large numbers of women; and the depletion of the male workforce due to high rates of emigration and the colonial wars for a 20-year period from the 1950s onward (Lyonette, Crompton, and Wall 2007, 286). The feminization of the Portuguese labor force was further intensified with the growth of the tertiary service sector and public administration after the 1974 revolution. The participation of women in the economically active population has grown accordingly, from 40 percent in 1991 to 61 percent in 2009, compared to the European average of 58.6 percent. It has also often been noted that the labor market segregation according to gender is far less marked in Portugal than in other European countries (Tavora 2012, 64).

Women have a marked presence in the professional spheres and middle management. Female legislators, senior officials, and managers account for just under half of this sector, and more than half of the total number of professionals and technical workers are women (WEF 2013, 316). Yet, an overview of Portugal's private sector presents a highly uneven picture. More than 51 percent of firms and companies are part-owned or fully owned by women. Nonetheless, the presence of women directors on the boards of Portugal's listed companies amounts to 12 percent of the total (WEF 2013, 316). The Portuguese government adopted a resolution to increase the participation of women in both public and private companies' management structures, obliging public companies to adopt concrete plans for equal representation in the context of other social and environmental goals (Comissão para a Cidadania e Igualdade de Género 2014). Private companies were encouraged to implement identical measures.

Over the past decade, the Portuguese government has implemented several measures to tackle gender discrimination and attain a higher level of gender mainstreaming within the workplace. For example, the Project Social Dialogue is a partnership of private enterprise, civil society, and higher education institutions to promote equality in the labor market and implement good practices (Comissão para a Cidadania e Igualdade de Género 2014). Equally, the participation of women in the military, police, and security forces, from rank-and-file to executive decision-making positions, remains extremely small: within all ranks of the security sector, women are just more than 5 percent of the total number of personnel, and within police ranks, they

are under 10 percent. Within Portugal's army and navy forces, the ratio of women to men in the serving ranks is an average of 10 percent of the total throughout all ranks, although this statistic increases in the air force: women comprise almost one-quarter of the soldiers within this branch, and 15 percent of the total personnel. In the sphere of national defense and the military bodies, women and men may participate equally on the front line in situations of war and battle; no difference is acknowledged between "citizens of the female sex and of the male sex."

Pay

Gender segregation in the labor market is still highly evident, especially in regard to salary scales and total earnings, variously calculated at 18.5 percent, according to the government's own statistics, and 15.7 percent, compared with the European average of 16.4 percent.

Family Life

Marriage

Significant changes in the dynamics of marriage, partnership, and the family reflect broad trends in Portuguese society within the three key aspects of married life, divorce and parenting. While formal marriage remains the predominant basis for family organization, the rate of marriage ceremonies has decreased since the end of the last century. In the year 2000, marriages took place at a rate of 7.8 percent per 1,000 of the total population, and they now stand at just more than 3 percent (Marinho and Atalaia 2013, 3). Women in Portugal tend to get married in their late twenties. The mean age for marriage is 29, an increase of 4 years since 1960, when the average age for marriage was 25 (WEF 2013, 316). Furthermore, an increasing tendency to live together without the benefit of marriage has been more evident in recent decades.

Nonetheless, it is still the norm to formalize the union before procreating children. In 2009, for example, only 10 percent of couples in Portugal started a family before marrying (Marinho and Atalaia 2013, 7). The right to divorce without extensive litigation or petitioning was considerably extended in 2002 and again in 2008. Divorce could be instigated and granted by the mutual consent of both spouses or without the consent of one of the married parties. This has led to an increase of 21 percent in the divorce rate since 2002, but also an increase in divorces by mutual consent rather than antagonistic petitions. Dating from

the change in the Civil Code of 2008, almost 70 percent of all divorces have been approved by mutual consent of the formerly married couple. The rise in the rate and frequency of divorce means that Portugal has had the highest divorce rate in Southern Europe since the beginning of the millennium, and it is above the European average (10–11).

Family

Under the New State, a high birth rate was the norm and actively encouraged. The average number of children per woman of childbearing age was 3.2. After the nation's democratization, and following a general trend in Western Europe, the fertility rate decreased steadily, from 2.2 children per woman aged 15–49 years in 1980 to 1.28 in 2012. However, this birth rate is still higher than that of the other Western Mediterranean countries, such as Spain and Italy. The median age for a woman to have her first child is now just under 30, and a trend toward only children is also noticeable. The percentage of couples with no children at all have also increased to just under half, or 41 percent, in 2011, and of the near 60 percent of couples with children, more than half of these have just one child (22).

Family structures have also undergone considerable transformations over the past three decades. While the married couple with a child or children currently accounts for nearly 60 percent of family households, there has also been a reduction in the average size of the family and an increase in the number of people living alone. This sector of the population comprised just more than 20 percent of households in Portugal in 2011 (16). Almost half the individuals who live alone are over 65, and this trend is also linked to the decline of the extended family, that is, more than five relatives within one household. The extended family, which provided a strong support network under the regime of the New State, declined from 17 percent of the total households to just 2 percent in 2011.

Household Roles and Responsibilities

Almost 60 percent of economically active households in Portugal consist of dual-earning couples (22). However, despite the high participation of Portuguese women in the labor force, responsibilities for the domestic workload and family care are very unevenly distributed. On average, 76 percent of women undertake unpaid household duties on a daily basis, compared with 29 percent of men. This compares unfavorably with the European average of 45 percent male participation in household tasks (Kotowska

et al. 2010, 18). The same incompatibility between family life and women's employment is reflected in the upbringing and care for children on a daily basis: according to the same survey, almost no men were responsible for care of children within couples aged 18–34 years. Among couples aged 35–49 years, 31 percent of men were responsible for child care, compared with 41 percent of women (Kotowska et al. 2010, 220).

This issue is thrown into sharper focus by the fact that almost 90 percent of women between the ages of 25 and 34 are in formal employment, precisely the age at which they get married or cohabit and have their first child or children (Marinho and Atalaia 2013, 22). Households in which only the male partner is employed, with the woman taking care of the household, represent barely 18 percent of total households. The model encountered in Northern Europe, where the man holds down full-time employment and the female partner works part-time, is rarely encountered in Portugal, accounting for nearly 4 percent of households compared to the European average of 7.5 percent (38).

Maternity leave provision is relatively generous in comparison with the European average. Pregnant women are entitled to leave on full pay 30 days before and 6 weeks after birth. If they opt for a leave of 150 days, they are still entitled to 80 percent of their existing salary. Social insurance is the principal provider of maternity coverage, and public day provision exists for the care of preschool children. Another feature of family provision is the compulsory leave that new fathers must take: 5 consecutive days to be taken after the birth and 5 days within a 30-day period (WEF 2013, 82). The Labour Code of 2009 extended these rights still further to enable mothers and fathers to share leave between them. However, there is considerable evidence to suggest that these measures may directly conflict with societal attitudes concerning the role of women in society and the ability of the economy to absorb these changes. The perception of women as primary caregivers and their evident responsibility for care means that there is still a low level of participation by men of the paternity leave available to them, and women may still be generally perceived by their employers as being less eligible or available for professional opportunities.

Politics

The constitutions enacted during the era of the New State consistently decreed the primary duty of women to family life and the statutory role of the husband as the head

of the family. Women were subject to their husband's authorization in all matters concerning work, travel, and the conjugal home. During this era, domestic work and care of the family was also a legal obligation (Ferreira 2011, 157). Women received some limited right to vote in 1931. Nonetheless, this was restricted solely to women who were heads of household and those with a high school diploma or some other qualification proving their full literacy, a condition not imposed on the male population (Pires de Almeida 2009, 184). The complete franchise for women voters was granted in 1976, two years after the overthrow of the New State. From the establishment of a parliamentary democracy in 1974, top-down reform was implemented, with legislation prohibiting gender-based discrimination and large number of decrees pertaining to pregnancy, maternity, and family assistance rights for women, together with employment subsidies and a national minimum wage.

In the sphere of participation in international diplomacy and the promotion of women's rights and equality within the European Union, Portugal participated in the construction of and adopted the Beijing Declaration and Platform for Action 2015, and it has subsequently attempted to implement its key policies. On a national level, several governmental plans for gender equality have been drawn up and implemented since 1997. Currently, the Fifth National Plan for Gender Equality is in place, and this will run until 2017. The body responsible for implementing this plan is the Commission for Citizenship and Gender Equality (CIG), which plays a key role in coordinating the actions of all government ministries.

The representation of female elected representatives in the nation's unicameral parliament amounts to just less than one-third of the total: a fifth of ministerial positions are occupied by women (WEF 2013, 316). This level of representation is linked to larger issues of women's access to other spheres of national, economic, and social life. A large proportion of female representatives, and especially cabinet ministers, are drawn from the ranks of the specialist professional and managerial class and with higher levels of educational attainment than their male counterparts (Pires de Almeida 2009, 177–189). There has never been a female head of state in Portugal, although for a period of five months in 1979 Maria de Lurdes Pintassilgo was the nation's prime minister, and Assunção Esteves was elected as president of the National Assembly of the Republic in 2011 the first woman to hold a post that ranks second only to the nation's president.

A law adopted in 2006 established a minimum representation for both women and men in the lists of candidates for election to the national parliament, the European Parliament, and to local government. Any list consisting of three or more candidates for election to these bodies must ensure a minimum participation of 33 percent for each sex (Comissão para a Cidadania e Igualdade de Género 2014). Additionally, candidates' lists should not comprise more than two persons of the same sex successively. The law was fully applied for the first time in the local, national, and European elections that took place in 2009. Due to measures such as these, together with the increasing participation of women in other spheres of national life, the proportion of women who hold seats has demonstrated a noticeable upward trend since 1990, when women comprised 7 percent of the total number of representatives. In 2014, the ratio of females holding seats was just under a third of the total number. Progress at the local level remains slow and has not progressed significantly from the situation in 2009, when there were 23 women leaders of the nation's 308 municipal authorities, or 7.5 percent of the total.

Religious and Cultural Roles

According to the census of 2011, just over 80 percent of the population of Portugal identify as Catholic. Of these, under 20 percent are practicing Catholics, defined as those who attend Mass regularly. Under half of all marriages take place in a Catholic church and according to Catholic ritual. These figures indicate a decline in religious belief in Portugal due to the increasing consolidation of the secular state and the nation's progressive modernization. The majority of Catholic practitioners are located in the more rural north of the country. According to the precepts of the Catholic Church, women may not serve as priests, but they may perform subsidiary roles as lay readers and helpers. A strong role has traditionally been played by the church in promoting traditional family roles (Tavora 2012, 64).

In recent years, the church, while sidelined under the Portuguese government, has strongly criticized the lack of support given by the government to families, especially dual-earning families, and asserted the role of women as primary carers for their families. The church also played a leading role in opposing the move by referendum in 2007 to legalize abortion up to 10 weeks of pregnancy: that the majority vote was in favor of this was taken as a sign of the church's waning power. The decline in the hegemony

of the Catholic Church as a yardstick for personal and public morality is further indicated by the reduced number of marriages by religious ceremony. In 2012, Catholic marriages represented just under 40 percent of all wedding ceremonies; on the other hand, the proportion of civil marriages rose from 9 percent of the total in 1960 to just more than 60 percent in 2012 (Marinho and Atalaia 2013, 5).

Nonetheless, popular religiosity remains a strong force in Portugal and is manifested in numerous religious festivals and the veneration of local saints. Women play an important role in this aspect of cultural beliefs and practices (Manuel 2013, 102). The cult of the Virgin Mary of Fatima, who appeared to three young shepherds in 1917, is internationally known. The oldest of the three witnesses, Sister Lucia, a revered and iconic figure in Portugal throughout the 20th century, whose death in 2007 was the occasion for a day of national mourning, is representative of the role that Portuguese women with mystical and administrative gifts have played in the church over the centuries.

Issues

Violence

The Portuguese government has implemented an overall national strategy to prevent and combat violence against women and girls, including domestic violence. This strategy originated from a national survey on violence against women. The results of this survey revealed that violence against women occurred mostly in private and domestic spaces and within marriage. The response to the survey was to divide domestic abuse and assault as a separate legal category from other gender-based forms of violence, and a National Plan against Domestic Violence was launched. The Fifth National Plan to Prevent and Combat Domestic and Gender-Based Violence is in force until 2017, and it is based on the Istanbul Convention. Under the plan, civil society organizations also play a front-line role in establishing refuge for female victims of violence. In 2000, the law was amended to integrate a measure whereby any third party who has knowledge of domestic violence may lodge a complaint or press criminal charges.

In 2013, Portugal was the first EU nation to ratify the Council of Europe Convention on combating violence against women and domestic violence. Nonetheless, rates of reported domestic abuse remain high. A report in 2011 indicated there were 33,707 victims of domestic abuse, of which the majority of victims were women and the

perpetrators were male. Of reported domestic violence cases, 80 percent involved a current or former partner (WAVE Country Report 2013). A legal framework exists in Portugal for the specific prevention of domestic violence and the provision of protection and support. The Portuguese Criminal Code also makes some provision for domestic violence defined as a separate crime from physical abuse. Legal aid is also available and the exemption from court fees in the case of hardship. Nonetheless, provision for the support of women victims of violence and rape is limited in several key aspects: there are presently 37 women's shelters, partly funded by the state, but no national women's helpline (WAVE Country Report 2013).

Rape is defined as a criminal act in the Portuguese Criminal Code. In the case of adult victims of rape, investigation and prosecution depend on the victim's complaints. In 2012, 375 complaints of rape were reported, representing 20 percent of all sexual crimes covered by the Portuguese Penal Code. A majority of the perpetrators in these cases were either family members or known to the victim (Macedo 2012). There are no gender-specific centers for survivors of sexual violence (WAVE Country Report 2013).

Inequality

Marked gender inequalities are illustrated by a number of indicators, notably in the area of income and salaries: whereas the ratio of women to men in the Portuguese workforce is almost 90 percent, women's annual earned income amounts to just under 60 percent of that earned by male workers (WEF 2013, 316). However, an equal number of men and women are below the government's officially designated poverty line, a group that includes almost 20 percent of Portugal's population. Of these, marginally more women—slightly more than 50 percent—are recipients of the top-up benefits scheme, the Social Insertion Income, and significant beneficiaries of the main programs to combat poverty in Portugal. In addition, women's presence also dominates the frequently precarious and low-paid formal economy, and female workers are more likely to suffer from abusive practices, such as delayed payment of salaries, short-term contracts, and casual employment (Ferreira 2011, 159).

The infrastructure for supporting a family and working life is often weak and compounded by the fact that Portugal has the longest working week in the European Union. Thus, middle-class women are often supported in their professional careers through informal support networks

and the use of unqualified domestic female labor. Furthermore, this domestic work is frequently undertaken by recent or illegal female immigrants from various countries of origin. Legislation originally passed in 1992 regulating the rights and conditions of domestic workers provides little protection compared with other labor sectors. According to an inquiry into the situation of domestic workers carried out in 2009, for example, up to 15 percent worked over their contracted hours and remained without provision for vacations or time off (Gami: Immigrant Women Support Group 2012).

Trafficking

Portugal is principally a destination country for victims of trafficking, the majority of these originating from Portuguese-speaking countries such as Brazil, Africa, and Eastern Europe. Until 2011, more than half of the victims were women who were trafficked for purposes of sexual exploitation (GRETA 2013). Nonetheless, no one gender or group has been identified as especially vulnerable to trafficking, which may also be for the purpose of labor or other exploitation.

LGBT Rights

Gay and lesbian rights were recognized in the Constitution of 2001 and more recently, in 2010, in the amendment of the Civil Code, which recognizes the right to civil marriage for gay couples (São 2010, 53). Gay civil unions have accounted for 3 percent of all marriages every year since (Marinho and Atalaia 2013, 5). Within LGBT societies and organizations, women comprise the majority of activists (Carneiro 2009, 186–187).

R

Republic of Macedonia

Overview of Country

The Republic of Macedonia gained independence from Yugoslavia in 1991, the only former Yugoslav republic to secede peacefully. The country is located in Southeastern Europe within the central Balkan Peninsula. It is a rugged, landlocked nation bordered by Kosovo, Serbia, Bulgaria, and Albania. A central valley is formed by the Vardar River, and mountains frame the country's borders. Lake Ohrid is one of the world's oldest lakes and one of Europe's largest biological reserves, possessing species that are extinct elsewhere (Ministry of Urban Planning, Construction, and Environment 1998). The area is seismically active, with the most recent destructive earthquake heavily damaging the capital of Skopje, killing 1,070, injuring 3,300, and leaving 76 percent of the population without shelter. This disaster caused losses of about 15 percent of the gross domestic product (GDP) for the year 1963 (Petrovski 2004).

In 2014, Macedonia was ranked 33rd out of 155 nations on the UN Development Programme's (UNDP) Gender Inequality Index (GII) (UNDP 2015). The Global Gender Gap Index for Macedonia is 0.694, ranking it 70th out of 142 countries (WEF 2016). Macedonia has a customarily patriarchal society; however, suffrage is universal (minimum age of 18), and women participate in the labor force and government. The Constitution specifies that all citizens

are equal in rights and freedoms, and gender equality is implemented throughout Macedonia's legal regulations. Macedonia has made considerable progress in advancing women's rights since independence; however, additional progress is needed in addressing prostitution, human trafficking, conditions for ethnic women, and women's political participation (United Nations 2006).

Girls and Teens

In principle, the sexes are equal; in practice, men enjoy higher status, and these divisions begin in childhood. Of particular concern for women and girls are issues about the lack of sex education, poor access to modern contraception, child abuse, early and forced marriages, and sexual exploitation and human trafficking. Such issues can be complicated by ethnicity, socioeconomic status, education, and region or location.

Sex Education

Sexual education is not part of school curricula. The absence of an organized framework for dissemination of sexual and reproductive health knowledge to youth results in several concerns. Risky sexual behavior is prevalent, information on sexual and reproductive health is lacking, and sexual and reproductive health services are rarely utilized. About 32 percent of youth (ages 19 and under) are

Romani Women's Activism

Romani, or Roma, women form a distinct part of one of Europe's largest ethnic minorities—10 million Romani people (formerly known pejoratively as Gypsies). A regional Romani women's movement emerged in Central and Eastern Europe in the early 1990s after the fall of the Soviet Union, following earlier articulation of Roma women's issues in Western European countries, particularly Spain. Romani women's activism takes a variety of forms: participating in mainstream Romani politics, seeking greater political recognition for the Roma community, addressing women's and children's issues through a gender lens sensitive to Romani culture, and creating a small but robust transnational group of Romani feminists.

In the early 21st century, Romani feminists raised issues of multiple discrimination based on gender, race, ethnicity, and class, inspired in part by Kimberlé Crenshaw's theory of intersectionality as well as European antidiscrimination and human rights frameworks. They addressed key issues, including segregated school systems, inadequate access to health care, employment discrimination, and lack of housing from women's perspectives. They also daringly breached ethnic solidarity by critiquing patriarchal tendencies within their own cultures, raising awareness of issues that included domestic violence, early marriage, prostitution, and trafficking in women and children.

In 2011, the European Court of Human Rights found that Slovakia violated Roma women's human rights in cases of coerced sterilization. This set a precedent for thousands of Romani women sterilized without their consent in Central and Eastern European countries from the 1970s to the 1990s.

At the international level, beginning in 2000, Romani feminists participated in UN conferences and processes on women, such as the CEDAW reviews. In 2005, Enisa Eminova, a young Macedonian Roma feminist, spoke at the Association for Women's Rights in Development (AWID), an important periodic gathering of 2,000 women activists, and challenged the global feminist movement to include Roma women's issues.

—Debra L. Schultz

sexually active: 40 percent of boys and 21 percent of girls (UNFPA 2013). About 31 percent of boys and 3 percent of girls initiate sex before turning 14 (UNFPA 2015). Most youth have expressed a need for information about modern contraceptives. Only 1.6 percent of girls (ages 15–19) used oral contraceptives, and only 34.8 percent of youth had used a condom during intercourse.

Access to contraception is limited, mainly due to cost; however, the number of adolescent girls giving birth has declined from 6.7 percent in 2008 to 1.3 percent in 2015, and the average age at first birth has risen from 26 in 2010 to 26.8 in 2014. The latter is lower compared to other European nations (State Statistical Office 2015a; UNFPA 2013, 2015). Such statistics vary within the population. For example, the average age at first birth is lower, and the adolescent birth rate (94/1,000 women aged 15–19 years) is higher among the Roma (UNFPA 2015).

Child and Common-Law Marriage

Child marriage is legally possible, traditional, and has a long history. The United Nations does not consider Macedonian legislation adequate for protecting children or addressing child marriage. The legal minimum age for marriage is 18; however, a court may grant 16-year-olds permission to marry. Unregistered common-law marriages are common when one spouse is underage. Such unions are criminal when one spouse is an adult and the other is under 16 years old; however, courts are often lenient in punishing such arrangements. The most frequently utilized justifications for child and common-law marriages are pregnancy, the need to preserve family "honor," and obtaining a "better life" in Western countries (when a groom working abroad comes home to obtain a wife) (UNFPA 2013).

Child marriage is particularly widespread among the Roma; 11.9 percent marry below the age of 15, and 47 percent below 18, compared to a national average of 1.4 percent and 10.7 percent, respectively (WHO 2015). Many Roma girls leave school early because Roma believe a girl's place is at home to ensure she is properly prepared for marriage and that her virginity is preserved. Most Roma couples enter into common-law marriages, which are recognized within their community. This practice is commonplace because the majority of Roma do not possess identifying documents (required to register a marriage); live in poverty (cannot afford to register a marriage); are poorly educated; experience high unemployment; are

traditionally mobile; and often enter into marriage under-age. These factors influence and perpetuate the practice of child marriage. Lack of identification is often passed on to the next generation, creating generations of Roma “phantom children” who are deprived of access to health care, education, and social care. These children see child marriage as a way out of such a precarious situation (UNFPA 2013).

Education

The Constitution guarantees the right to a free education. Public expenditures on education in 2008 were about 4.7 percent of GDP (Trading Economics 2016). Statistics show high national averages; however, gaps exist in access and enrollment between different societal groups, and such patterns of inequity are complex. The quality and learning outcomes of public schools show need for improvement. Macedonia scored last (out of 14 countries) on reading and mathematics exams, ranking the country below international averages. Almost all children finish school; however, test scores indicate that they are not all mastering basic literacy and mathematics skills (UNICEF 2009). Macedonia’s teacher-to-pupil ratio is 1:19, which is average for the region; however, teaching may be of low quality due to the use of outdated pedagogical practices, poor teacher preparation, inadequate instructional time, lack of teacher professional development, out-of-date materials, and lack of library access (UNICEF 2009).

Preprimary, Primary, and Secondary Education

Education is compulsory for children ages 6–19. Only 11 percent of children attended preschool in 2005: 15 percent of boys and 6 percent of girls. Up to 19 percent of children in urban areas attended preschool compared to as low as 2 percent in rural areas. One-quarter of children in the richest households attended preschool compared to only 1 percent of children from the poorest households. Ethnic disparities exist as well, with Albanian and Roma children rarely attending preschool (UNESCO-IBE 2011).

The primary school net enrollment ratio (NER) in 2005 had increased to 92 percent, the third highest in South-eastern Europe. No differences were found between gender or location (urban vs. rural) at the primary level; however, socioeconomic differences impacted primary school participation: 95 percent of appropriately aged children from the richest households attended compared to 86 percent

from the poorest households. Additionally, Roma children experience less success than Macedonian students at all educational levels. Roma children experience significant discrimination from teachers, administrators, and other students and are often tracked into schools intended for children with mental or physical disabilities, which offer reduced curricula and have relatively low quality standards. Roma are overrepresented in such schools, significantly above the national average (Roma Education Fund 2007). Most schools provide instruction in Macedonian, although some schools teach in Albanian, Turkish, or Serbian; no schools provide instruction in Roma (State Statistical Office 2015a). Due to these challenges, only half of Roma children complete primary school, 13 percent matriculate into secondary school, and just over half of those graduate (Roma Education Fund 2007).

Students aged 15–19 must attend three to four years of high school. Gymnasias offer three types of programs: general education, science and mathematics, and languages. Technical and vocational schools prepare students for occupations such as construction, agriculture, and mechanics through teaching general education and vocational training. Art schools (music, ballet, and applied arts) offer a four-year course of relevant general and vocational education in the relevant field of art. The certificate of completion from any four-year secondary program provides students with the right to access higher education (UNESCO-IBE 2011).

In 2005, only 63 percent of appropriately aged children attended secondary school. This percentage was the lowest in the southeast region of Macedonia (37%) and among the Roma (17%). Differences in secondary school attendance also existed between urban (71%) and rural (56%) children and poor (34%) and rich (90%) children. A higher proportion of girls (68%) than boys (59%) attended secondary schools (UNESCO-IBE 2011) and girls participated more in gymnasium education, while boys preferred vocational education (State Statistical Office 2015b).

Higher Education

Students must pass an entrance exam to attend an institution of higher education (IHE). There are professional colleges that offer two-year diploma programs. Undergraduate programs can range from two to five years, depending on the program of study. Master’s programs last from one and a half to two years, and doctoral programs take a minimum of three years to complete (UNESCO-IBE 2011).

Tertiary enrollment is low at only 3 percent of the population, and this figure has not changed since 1999 (UNICEF 2009). The State Statistical Office (2015b) reports that the number of women enrolling in and graduating from IHEs has increased slightly. Female students generally enroll in social sciences, humanities, and medical science programs, while male students generally enroll in technical and technological science programs.

Health

The population is growing slowly (0.2%) and increasingly aging. The percent distribution of women and men in the total population is equal. From 2004 to 2014, young women (14 years old and younger) decreased from 19.6 percent to 16.3 percent, and older women (65 years old and older) increased from 11.9 percent to 13.9 percent; similar patterns were observed for men. Changes in the age structure of the population have affected the number of deaths. The average age at death is 74.8 years for women and 69.9 years for men. Women's life expectancy is 77.2 years, compared to 73.3 years for men (State Statistical Office 2015b). The life expectancy for Roma is 10 years less than the national average (WHO 2015).

Access to Health Care

The Constitution guarantees universal health care access for all citizens. A state-funded public health care system is free to citizens and registered long-term residents. The Ministry of Health oversees the public health system, and the independent Health Insurance Fund (HIF) collects contributions, allocates funds, and supervises and contracts providers. Employers must register employees with the HIF upon initial employment. Both employees and employers pay contributions into the HIF; however, employees are compelled to pay an additional 0.5% of their gross salary for insurance against work-related health issues. Dependents are covered by the insurance of the employed family member (Europe-cities.com 2016). The HIF provides 95 percent of the financial resources required by the public health system; the remainder is paid via the state budget, patients' co-payments, and out-of-pocket payments. The compulsory insurance covers care, medication, and supplies related to illness; injury at work and outside work; and preventative services (Kamcev et al. 2012). Health expenditures were 6.4 percent of national GDP in 2013, significantly lower than other former Yugoslav republics

and the EU average. In 2009, there were 2.62 physicians and in 2013 there were 4.5 hospital beds per every 1,000 people (CIA 2016).

Maternal Health

The average age at first marriage is 26 for women and 28.8 for men; however, this varies depending on ethnicity, education, and income level. The total fertility rate was 1.52 live births per woman in 2014. Women aged 25–29 gave birth to 35.5 percent of all babies born in 2012 (State Statistical Office 2015b). The maternal mortality rate was 8 deaths per 100,000 live births, and the infant mortality rate was 7.7 deaths per 1,000 live births in 2015. The contraceptive prevalence rate was 40.2 percent in 2011 (CIA 2016). Supply and demand for modern contraceptives is low due to poor family planning services and prejudices against their use (UNFPA 2015). The law provides for freedom of choice regarding abortion, which can only be limited due to health reasons (UNFPA 2013). The abortion rate in 2013 was 21.5 per 100 live births. Legitimate live births accounted for 88.5 percent of all births (State Statistical Office 2015b).

Macedonia launched a national program that integrates several public health interventions required for the improvement of maternal and infant health. Many health statistics have improved; however, there are disparities related to socioeconomic status (SES), ethnicity, and education. Roma, rural, and poorly educated women benefit less from maternal health care than non-Roma, urban, and well-educated women do. For instance, the infant mortality was three times higher among poorly educated women. Contraceptive use is lower among rural, poor, and low-educated women and has actually decreased over time for Roma women (UNFPA 2015). The social norms, practices, and cultural values of the Roma perpetuate stigma, neglect, and discrimination by service providers.

To address this prejudice, Macedonia made a political commitment to improve the social and economic conditions of the Roma, with priorities in education, health care, employment, and housing, by signing the Decade of Roma Inclusion (2005–2015). The National Action Plan for Roma Health was enacted to reduce inequities in health, and, so far, preventive programs for children, women, and youth have expanded to reach Roma and rural communities. Initiatives have included working with parents in early child development centers, improving the health information system so that data can be desegregated by ethnicity,

establishing a network of youth-friendly services for sexual and reproductive health, introducing Roma health mediators, issuing educational and promotional materials in the Roma language, and training health professionals to be more culturally competent (WHO 2015).

Diseases and Disorders

The health situation is characterized by a high prevalence rate of noncommunicable diseases, many of which are related to irregular lifestyles. The population, especially younger individuals, are facing the challenges of bad habits, including smoking, excessive consumption of alcohol and other psychoactive drugs, diets rich in fatty foods, and improper sexual behavior, any of which can lead to addiction, infectious disease, and physical and mental disorders (Kamcev et al. 2012). Cardiovascular disease is the leading cause of death, followed by cancer, likely related to elevated risk factors, including high blood pressure, high blood sugar, and obesity, which are all high compared to the region (WHO 2012). The breast cancer incidence rate was 111.7 per 100,000 women in 2013, with a mortality rate of 28.7 percent. The cervical cancer incidence rate was 16.6 per 100,000 women in 2013, with a mortality rate of 14.4 percent (UNFPA 2015). Adult prevalence rate of HIV/AIDS in 2013 was 0.01 percent; 200 people were living with HIV/AIDS, and related deaths were estimated at 100 (CIA 2016). The HIV epidemic mainly affects intravenous drug users, prostitutes, prisoners, and homosexual men (UNFPA 2015).

Employment

Since independence, Macedonia has strengthened its economy. In 2015, GDP was USD\$28.89 (PPP) and was ranked 131st in the world. High unemployment (more than 30%) has remained a problem since 2008; however, this may be overestimated due to the large informal economy (20%–45% of GDP) (CIA 2016). Since 2007, more than 60,000 jobs have been created, but employment rates remain the lowest in Europe. Since the 2009 global economic crisis, labor productivity has fallen, informal employment has grown, and wages have stalled for low earners, all of which contribute to increasing inequalities.

Older individuals (45 years old and above) are often lower skilled and are less adaptable, frequently leading to long-term unemployment. Younger individuals have more access to education; yet, many drop out, limiting employment options. Individuals with university degrees have

access to better jobs, but the competition is high, leaving many lacking adequate employment, which has resulted in increasing unemployment for this group. Ethnic minorities, rural inhabitants, eastern region inhabitants, and women have particularly low chances of finding employment (World Bank 2014). Roma face particularly high levels of unemployment, and, consequently, the number of Roma living in poverty is three times higher than that of the rest of the population.

Women in the Workforce

Employment is “characterized by a very unfavorable gender structure” (State Statistical Office 2015b, 59), which has persisted over time. The 2014 employment rate for women was 32.4 percent, compared to 50.1 percent for men (World Bank 2014). The youngest, oldest, and least-educated women are less likely to be employed, possibly reflective of family responsibilities. The gender gap is exacerbated for Albanians and Roma, both of which value traditional norms regarding female roles. Significant gender differences persist in employment choices and options. One in six employed women are unpaid family workers, and less than 10 percent are self-employed (compared to 25 percent of employed men).

Women are less likely to work in the informal market and are more concentrated in manufacturing and social sectors, while men are more active in trade and construction (World Bank 2014). Such differences in employment impact pay; the gender pay gap is about 27 percent (the EU average is 17.8%). About 83 percent of the gender pay gap cannot be explained by differences in education, age, location, sector, or occupation, which points to discrimination. This problem persists despite laws that obligate employers to pay equal wages for equal work regardless of gender (Raleva and Dimitrijevska 2013).

Labor laws provide for long maternity leave, limited working time and shifts for women, and lower retirement ages for women. These laws are intended to protect women's rights, but they may have unintended negative impacts. Maternity leave is 39 weeks at 100 percent of salary. Long maternity leave is beneficial for maternal and infant health; however, it creates employer resistance to hiring women of childbearing age (Independent.mk 2014). Women may retire at age 62 and men at 64 (CCM 2016), which may affect an employer's decision to hire women. Roughly 30 percent of women believed men were prioritized for hire by employers (Zdrzenska 2012). Labor laws and employer practices are rigid in comparison

to other European nations, and lack of flexible scheduling options negatively impacts female participation and protection in the workforce (Kalamatiev and Ristovski 2014).

One-third of women believe motherhood and a career are contradictory. Working women believe more state efforts should be taken to harmonize domestic and professional obligations of women, including expanding and improving existing child care options. About 13 percent of women have experienced sexual harassment, and 28.9 percent have experienced psychological harassment at work. Laws protect against these forms of harassment; however, only half of women were aware of them, and only one-third believed they would be enforced (Zdruzenska 2012).

Family Life

The government actively promotes traditional family values through legislative and program interventions and expensive media campaigns. The state has run campaigns promoting large families as “traditional” and “patriotic,” as well as pro-life campaigns. The state allocated significant funding to such advertising, more so than for programs promoting gender equality and women’s rights, which rely more on foreign aid (Zdruzenska 2012).

Traditional Family Roles

A traditional patriarchal model of divided roles with women raising children is dominant. Men and women have equal legal parental and marriage rights; however, traditional and patriarchal values influence marriage arrangements and women’s roles within family life. One in five women believes that a woman does not have the right to refuse a marriage proposal if the match was arranged by her family. Almost all married women (90%) report that they are responsible for child care and traditional household chores. Most wives are additionally responsible for school obligations, caring for ill or elderly relatives, purchasing food, yard work, heating the home, maintaining a garden, or other agricultural tasks (particularly in rural areas). One-third of women report that most decisions are made by their husbands, mothers-in-law, or other family members. About 25 percent of women reported feeling the need to ask for permission from their husbands, mothers-in-law, or male family members before making decisions about health care, employment, education, or leaving the home. Half of women believe that a woman is obliged to respect her husband’s decisions (Zdruzenska 2012).

Politics

Macedonia is a parliamentary democracy. Parliament is the country’s legislative body, and the 120 members are elected for four-year terms. The president of the republic is the chief of state, but this is mainly a ceremonial role. The prime minister is the chief of the executive branch and the most politically powerful person in the country. The prime minister is elected for four-year terms, and he or she chooses ministers for each government branch. Judiciary power is exercised through a court system headed by the Supreme and Constitutional Courts (CIA 2016).

Participation in Government

Female voter participation is lower than male and is largely impacted by tradition, poor economic status, and low education. Family voting is permissible in Macedonia, whereby a family member can vote on behalf of a woman. While not common, 6 percent of women reported that a husband, father, or brother had voted for them before (Zdruzenska 2012). Barriers to female political participation include family obligations, concerns about discrimination and garnering voter support, and a belief that political activism is indecent; however, most women believe increased female political representation would improve women’s situations (Zdruzenska 2012).

To increase female political participation, an affirmative measure was added to the Electoral Code in 2006, which stipulates that every third slot on candidate lists must be reserved for the less-represented gender (Kalamatiev and Ristovski 2014). This legislation may be having an impact. In 2009, no women won mayoral elections, but four won in 2013 (SIGI 2016). About 30 percent of Parliament is made up of women; yet, during 2011–2015, only 12 served in committee leadership roles. Women hold about 50 percent of positions in state administration, but this is declining. These positions are mainly of lesser power and influence than those held by men. Women are rarely appointed as ministers or deputy ministers within the executive branch. In the 2009 presidential election, there was one woman candidate who received about 3 percent of the votes (Zdruzenska 2012).

LGBT Rights

ILGA-Europe ranks Macedonia as the worst of the Balkan countries regarding legal protection for LGBT individuals (Marusic 2012). The LGBT community is described as harassed, and reports of violence, vandalism, and

discrimination are commonplace. There are three organizations and a support center working to improve LGBT rights; the latter has been attacked six times since opening in 2012 (ILGA-Europe 2013; U.S. Department of State 2015). Same-sex activity was illegal until 1996, when it was decriminalized as a condition for Macedonia's admission to the Council of Europe. From 2008 to 2010, LGBT individuals were protected from employment discrimination; however, Parliament removed this protection. Currently, there are no laws protecting LGBT individuals from discrimination or hate crimes.

In 2015, voters approved a constitutional ban on same-sex marriage. The state backed this amendment to "affirm, promote, and protect a traditional foundation of society" (Amnesty International 2015, para. 2). A ban on same-sex civil unions was removed when the Council of Europe declared it incompatible with the European Council on Human Rights; however, this removal had little impact, as same-sex partnerships cannot be legally registered. Same-sex couples cannot adopt children or utilize medical interventions to conceive children (ILGA-Europe 2013).

Religious and Cultural Roles

The most common religion is Orthodox Christianity (64.8%), which is practiced by most ethnic Macedonians. Muslims account for 33.3 percent of the population and are mainly from the Albanian, Turkish, and Roma ethnic minorities; this is the fifth-highest proportion of Muslims in Europe. By 2050, Islam is predicted to become the country's largest religion, representing 56.2 percent of the population (Pew Research Center 2015).

Macedonian Orthodox Church (MOC)

The Serbian Orthodox Church (SOC) has long sought to regain control over Orthodox Christians within Macedonia, which has caused an ongoing struggle with the MOC. The main dispute centers on the MOC's autocephaly, or ecclesiastical independence, which was declared in 1967. The SOC (and the majority of other Orthodox churches) rejects the legitimacy of the MOC and has recognized the Orthodox Archbishopric of Ohrid as the only canonical church within Macedonia (U.S. Department of State 2006); it is led by Archbishop Jovan, the only Macedonian church leader to favor a 2002 compromise agreement. The Serbian government sent funds to this church, which earned Jovan the reputation of traitor. Jovan has claimed violations of the right to freedom of religion because the government

refuses the registration of his church. SOC places of worship have been attacked, and a criminal case has been filed against him. Jovan was arrested, removed from his bishopric, and expelled from Macedonia. He returned in 2005 only to be jailed after performing a baptism. The dispute continues; the SOC regularly denies MOC clergy access to religious sites under SOC control, and Macedonian police often deny Serbian priests entry into the country (Bjelajac 2004, 2005).

Issues

Macedonia experiences many challenges due to the ethnic makeup of its population. Macedonia has a population of roughly 2 million. Macedonians are the largest ethnic group (64.2%), followed by Albanians (25.2%); Turks, Roma, and Serbs make up the remainder of the population (CIA 2016). Many of the challenges created by this ethnic makeup impact the lives of women, both in the ethnic majority and the minority populations, and were discussed throughout the sections above. Additionally, the ongoing conflicts, migrations, and refugee crises in the region have influenced women's lives in multiple ways.

Albanian Conflict

Ethnic Macedonians and ethnic Albanians have uneasily coexisted for some time. Albanians are concentrated near the Albanian, Serbian, and Kosovo borders. Since independence, Macedonia has focused internally on promoting democracy and interethnic relations, including Albanian political parties in government. In 1994, a radical Albanian faction declared an autonomous republic in the western region, and the Macedonian government viewed this as an effort to secede (BBC 2015). This tense relationship was exacerbated in 1999 when 360,000 refugees flooded into Macedonia, fleeing the Kosovo crisis; the majority were evacuated to other countries or repatriated by year's end (United States Committee for Refugees and Immigrants 2001).

Members of the Kosovo Liberation Army infiltrated Albanian populations in Macedonia and attacked police in Tetovo in January 2001. Soon after, the National Liberation Army (NLA) emerged, demanding equal rights for ethnic Albanians. A series of bloody battles raged between NLA and government forces until August 2001, when the NATO-backed Ohrid Agreement was signed (BBC 2015). The agreement set the groundwork for increasing Albanian rights in Macedonia. Specifically, it did the

following: (1) made any language spoken by at least 20 percent of a municipality's population co-official to Macedonian; (2) increased participation of ethnic Albanians in government institutions, police, and army; and (3) developed a new model of decentralized government. The Albanians agreed to give up separatist demands, recognize Macedonian institutions, and disarm the NLA, relinquishing all weapons to NATO (ESI 2016). The Ohrid Agreement remains in effect; however, isolated armed conflicts have occurred periodically since 2010 (BBC 2015).

Romania

Overview of Country

Romania is located in Southeastern Europe, at the limit of the European Union (EU), bordering Serbia to the southwest, Hungary to the northwest, Ukraine to the north and the east, Bulgaria to the south, and the Republic of Moldova and the Black Sea to the east. Romania enjoys a varied relief, with the Carpathian Mountains in the center, the

Black Sea coast to the east, and the Danube River flowing in the south. Most of the Danube Delta is also in Romania, with approximately 300 species of birds, 3,450 species of animals, and 1,700 plant species (Romania National Tourist Office 2016). The capital of Romania is Bucharest, which has a population of about 2 million people (INS 2011); it is an architecturally eclectic city, as most of its center was demolished in the 1980s to build its well-known landmark, the House of Parliament, the second-largest building in the world after the Pentagon (Romania National Tourist Office 2016). Romania has the highest rural population in the European Union, 46 percent, compared to the EU average of 24 percent (CIA 2015).

The country is 92,043 square miles (238,391 sq. km) and has a population of 20,121,641 inhabitants (INS 2011), including 1,227,600 ethnic Hungarians (6.5%) and 621,600 Roma (3.3%). It is believed that the Roma population is actually much higher; estimates by nongovernmental organizations (NGOs) reach around 2 million. Up until the 19th century, the Roma used to be slaves of private landowners or the Romanian Orthodox Church, who had the right of selling them or killing them, as they so pleased. The Roma were freed in 1856, but they were not given any entitlement; so they continued to have a very precarious situation (Dieaconu 2016). There are numerous complaints against different types of discrimination against the Roma registered with the National Council against Discrimination (CNCD), but Roma NGOs say their number is clearly underrecorded. Also, it is important to say that the Romanian state implemented a set of affirmative action policies for the Roma minorities (e.g., in education).

There is a high number of Romanian citizens currently living or working abroad. In the 2011 census, this number was 910,264, but there are higher estimates of about 3 million people (OECD 2014). Most Romanian citizens live and work in other EU countries: Italy (169,766), Spain (71,102), Germany (29,084), the United Kingdom (19,064), and others (INS 2011).

The history of the Romanian state is not very long, with its first proclamation in 1918, through the unification of the southern and eastern parts of the country (until then, the Kingdom of Romania) and the western part, also known as Transylvania (until then, a province of the Austro-Hungarian Empire). The southern and eastern parts of today's Romania had been proclaimed a kingdom on May 10, 1881, with the German Charles I as first king. In the period between World War I and World War II,

the Kingdom of Romania saw its greatest development, especially in the arts, with important names such as writer Eugene Ionescu (Theatre of the Absurd), poet Tristan Tzara (the Dada movement), and sculptor Constantin Brancusi (a pioneer of modernism).

During World War II, Romania sided with the Germans, as its right-wing movement, the Iron Guard, rose in popularity and came to power. The pogroms against the Jewish population (still somewhat denied even today or only briefly mentioned in school history books) led to an (as yet) unverified number of victims, ranging between 150,000 (United States Holocaust Memorial Museum 2016), and 400,000 (Yad Vashem 2016).

After the war, Romania fell under the influence of the Soviet Union, and a severe purge of the country's elites followed in parallel with a process of subservience of the country to the USSR. In the Report of Analysis for Communist Dictatorship (Tismăneanu et al. 2006), the main criminal actions of the communist regime (1945–1989) were listed as follows: abandoning national interests to Soviet interests, destroying the democratic regime and the rule of law, disappearance of all political parties (up until 1989 there was only the Communist Party), physical annihilation of any opposition from outside and from within the Romanian Communist Party, and constant persecution of all cultural, religious, ethnic, and sexual minorities.

During the communist regime, gender balance was apparently observed, with about 40 percent of women in so-called power positions in politics, the economy, education, and so on. However, it must be emphasized that Romania was a dictatorship, and the people apparently holding positions of power were simply puppets placed there by the regime. Concerning women, it is important to note that they were forced to work under communism (unemployment was against the law and people who did not work were considered parasites), but they kept their traditional roles in the private sphere simultaneously. The state appeared to take over some of the domestic chores, by establishing state institutions to take care of children, the elderly, and so on. In reality, although forced to use them, Romanian women were reluctant to do so, as their quality was lacking in many respects.

Between 1965 and 1989, Romania was led by Nicolae Ceaușescu (1918–1989). In the beginning, he gained a lot of public support in the country and abroad, as he publicly opposed the invasion of the Warsaw Pact (the military alliance of the Communist Bloc) to put an end

Women's Voices

Herta Müller

Born in August 1953 in Nițchidorf, Romania, Herta Müller is the daughter of Swabian farmers and was raised under the oppression of the former Soviet Union during World War II. She saw her mother removed to a labor camp because her family was part of the German minority in Romania. During the 1970s, she was removed from her position as a translator when she refused to cooperate with the Communist secret police. This resulted in years of death threats, until Müller and her husband, author Richard Wagner, immigrated to Germany in 1987.

Müller received the 2009 Nobel Prize for Literature—only the 12th woman in its 108-year history to win this prize. She was recognized for “depicting the landscape of the dispossessed with the concentration of poetry and the frankness of prose” (Flood 2009). Said Müller of what influences her writing, “The most overwhelming experience for me was living under the dictatorial regime in Romania. And simply living in Germany, hundreds of kilometers away, does not erase my past experience. I packed up my past when I left, and remember that dictatorships are still a current topic in Germany” (Flood 2009).

to the anticommunist uprising in Czechoslovakia in 1968, but Ceaușescu soon proved to be a ruthless dictator. Together with his wife, Elena, and other members of his family, he instituted a personality cult and grandiose plans of bringing Romania “on the highest peaks of civilization” (as it was called in the history books of the period). He was captured and tried by a special military tribunal during the 1989 revolution, and eventually he was killed along with his wife by a firing squad on Christmas Day 1989.

After 1989, there followed a painful transition period from a state-planned economy to a more or less capitalist one and from a dictatorial regime to a democratic semi-presidential republic. Romania's accession to the European Union in 2007 and its joining NATO in 2004 contributed to the establishment and consolidation of the rule of law in the country. Although the gross domestic product (GDP) per capita is around 40 percent of the EU average (USD\$ 9,474.10 and GDP per capita PPP USD\$[0] 23,626.40), Romania has one of the highest growths in the European Union, at 3.7 percent (World Bank 2015).

Romania has an aging population, following the European trend in this respect, with 56.6 percent of the population between 25 and 65, 16.5 percent over 65, 15.5 percent 14 and younger, and 11.4 percent between 15 and 24 (INS 2014). The situation is increasingly more worrying with the high numbers of the population born between 1968 and 1970 due to Ceausescu's pronatalist policies reaching maturity. As in most European countries, Romania has a state pension system based on contributions during professional life, but there are worries regarding its collapse due to a higher number of pensioners versus working people to support it.

Romania ranks low in the European Union in terms of gender equality and women in power positions. Simultaneously Romania ranks high regarding poverty and violence against women. According to the European Institute for Gender Equality, Romania ranks last in the European Union regarding gender equality, with a score of 33.7, and is only halfway to achieving a gender-balanced society, with 52.9 points (out of 100) (EIGE 2015). Moreover, the Gender Gap Index (2014) derived by the World Economic Forum (WEF) places Romania in 72nd place out of 142 countries, with a score of 0.694 (where 0 = inequality and 1 = equality). And the UN Development Programme (UNDP) ranks Romania in 52nd place out of 188 countries based on the Gender Inequality Index (GII; 0.989) (UNDP 2015).

Girls and Teens

Romania has a declining number of children, with 9.27 births per 1,000 people, and the second-highest infant mortality rate in the European Union, with 10 deaths per 1,000 live births. There are slightly more male children up to the age of 14 compared to female (1.06) (IndexMundi 2014). In general, there is no preference for male children or direct discrimination regarding female babies at birth or in the first years of life.

Child Abuse and Child Trafficking for Forced Labor and Sexual Exploitation

Romania has signed and ratified a number of treaties and conventions regarding the rights of the child (under the umbrella of the United Nation), and respect for the rights of children is included in its Constitution (Article 42 prohibits the exploitation of minors and their employment in activities that might be harmful to their health or morals or might endanger their life and normal development) and internal laws, such as the Criminal Code and the Labor Code (which prohibits the employment of young people under the age of 15).

However, there are situations where such instances occur. For example, in rural areas, there are children who do agricultural work for very little pay, usually just food and water for the day or very little money. However, the real amplitude of the phenomenon is not known, as it is highly underreported (Shahinian 2011). In urban areas, especially in the capital Bucharest, there is a category of children called "street children." Some of them return to their families every night, after sometimes working more than eight hours in the streets. They are forced to beg; to wash cars; to collect recyclable objects (scrap iron, glass, paper, or plastic); and even to prostitute themselves.

There is another category of children who permanently live on the streets, and some of them are already the second generation; the first generation had been institutionalized in communist times and were released on the streets when the orphanages were opened in the early 1990s. There are no official estimates regarding their number, gender, or other details; NGOs believe they are between 800 and 1,000, and most of them live in Bucharest's sewer system or in dilapidated houses. Also, the majority of these children do not possess birth certificates; in other words, they do not exist for the state authorities, and thus have no access to education or health services.

Roma children represent the majority of street children and are at the highest risk of labor or sexual exploitation (Shahinian 2011). In July 2016, a terrible case of bonded labor and slavery was discovered in a rural area close to the capital, in which up to 40 people, including children, had been abducted and kept in chains while being forced to work for a family since 2008. Thirty-eight people were apprehended by the police, and at the time of writing this entry, they are awaiting trial.

There are sporadic cases of child trafficking discovered by authorities and reported in the press, but, again, their

numbers are believed to be underreported. Children are either trafficked internally or to foreign countries, where they are taken to private locations and forced to work or prostitute themselves. Again, Roma children seem to be more prone to such practices, mostly due to higher poverty and unemployment in these communities as well as lower levels of education. There are also cases of child prostitution, mostly children from rural areas; the parents are promised that the children will receive jobs in cities, but they are obliged to become sex workers. A special situation is unfolding at the time of writing this entry, as the minister of labor made a press statement regarding child trafficking and child prostitution in at least four or five state orphanages in Bucharest and the southeastern part of Romania; investigations are under way in July 2016. In November 2016 the minister stated that state institutions checked 129 public and private centers for children and there were a number of cases already taken to court, others under investigation, and others that triggered a change in the procedures (Hotnews 2016). After the elections of December 2016 and the change of government, there was no news on these cases.

Children Left Behind as a Consequence of Parents' Emigration

Romania has been facing a special situation, especially since the latest economic crisis in 2008, which also coincided with its joining the European Union. A lot of people became economic migrants to other EU countries and left their children behind without parental or other support. Some of these children were simply left in the care of distant relatives, neighbors, or older siblings.

Although parents are obliged to notify the authorities, this rarely happens, as they fear that the children may be taken away in the care of the authorities. Thus, statistics are unavailable. The data from the Ministry of Labor indicates their numbers at approximately 47,000 children with one absent parent and approximately 23,000 children with both parents gone (Salvati copiii 2012). Other estimates refer to 350,000 children affected by this phenomenon, and 126,000 affected by the migration of both parents, with half of those under the age of 10 (Toth et al. 2008). The school dropout rate for these children is also on the increase, and so is criminality and the suicide rate. Teenage girls are usually expected to take care of their younger siblings and do the house chores, and more often than not, this affects their right to education (Salvati copiii 2012).

Again, there are no statistics available, but the press has documented 20 cases of children who committed suicide due to emotional and psychological problems caused by their parents leaving them to work abroad.

Teenage Mothers

Romania ranks second in the European Union concerning the birth rate among women aged 15–19, with 39.4 births per 1,000 women, and the highest rate of births of first children to teenage mothers (15.6% of total births of first children in 2013) (Eurostat 2015). There are also cases reported in the press of girls as young as 12 or even 9 who become mothers. Romania is also first among the EU countries for the number of abortions to 1,000 live births among women under 20 years old, almost 500 in the period 2008–2011 (UNFPA 2013). The causes include poverty, lack of hope and expectations for the future, lack of information on health- and sexuality-related issues, and a tradition of early marriage (especially in the case of the Roma). The consequences are an increase in the school dropout rate for the teenage mothers; psychological problems, such as depression, anxiety, and the like; and the perpetuation of the spiral of poverty.

Education

The Romanian education system has been functioning since 2011 on a new education law that divides it into two main levels: preuniversity (including some vocational schools and postsecondary schools, where students learn a trade) and university (based on the European Bologna system: three years for a bachelor's program, two years for a master's degree, and three years for a PhD).

Romania contributes very little to its education (around 3% of its GDP compared to the EU average of 5% (Eurostat 2015). A lack of funds is one of the reasons the education system has a lot of problems. The other reason is its complete subservience to the political factor, although this is illegal; for example, school principals, school inspectors, and local and national education authorities are directly appointed by the political party that is in power. From 1990, at the fall of the communist regime, to July 2016, there have been 22 ministers of education, and the Law of National Education has been changed more than 60 times. Practically every new minister, when appointed to office, has decided that the previous education reform was not good and changed the system. The dire consequences are

that the public at large distrusts the educational system completely and either finds survival strategies within it or strategies for leaving it to study abroad (especially at the university level). Although there is a very small illiteracy rate (around 1%–2% of the population), 37 percent of Romanian 15-year-olds could be defined as functionally illiterate (OECD PISA 2012). Moreover, there is a high number of school dropouts, mostly in rural areas and within the Roma community: 18.1 percent in 2014 (the EU average is 11.1%) (European Commission 2015a).

Also, 79.7 percent of all teachers in Romania are female, mostly in nurseries and kindergartens (99.7%) and primary schools (89%). The percentages decrease in secondary education (71.3%), but with higher numbers in schools for special needs (82.7%) and fewer in vocational education (64.9 %) (MECTS 2015a). It is interesting that only 49.4 percent of the university teaching staff are women, with more women in the lowest academic positions: 56.9 percent of assistant professors are women and fewer at the top (only 30.2% are full tenured professors) (MECTS 2015b). Slightly more university graduates are female (13%, compared to 12.5% male) (EIGE 2015).

Primary and Secondary Education

There are no discrepancies between the numbers of primary and secondary school graduates regarding their gender (UNICEF 2015), with the exception of the Roma population, where a smaller number of children attend primary school (between 4% for 3-year-olds and 23% for 6-year-olds) (Surdu 2011, 5). The main reasons are the lack of education of the parents, a lack of resources, and also the belief that children are better off at home or that the parents need to take the children with them when migrating to other areas for work (6). In secondary education, gender differences are not significant either, with 8–10 percent of school dropouts for each gender (UNICEF 2015).

In the case of the Roma minority, though, research indicates that for children between the ages of 12 and 16, two-thirds (64.62%) are in the situation of not attending school, with the main reasons being poverty, absent parents, the negative attitude of the family toward education, peer influence, repeating the class, and early marriage (Surdu 2011, 6). In this respect, gender differences are higher, as early marriage mostly affects girls, who also become teenage mothers; the reason is mostly cultural and based on traditions of the Roma communities. Unfortunately, this perpetuates a poverty spiral for these communities (UNICEF

2015). Other important reasons for not attending school are lack of identity documents, which are compulsory for school enrollment; not speaking (or poorly speaking) the Romanian language; not having schools in Romani; and discrimination that leads to segregation, marginalization, and stereotypical views of the Roma (e.g., violent, prone to criminality, lazy, etc.).

University Education

The situation is different in high school and college, though. Data from 2008–2010 shows that 86 percent of the females who pass the high school graduation exam (baccalaureat) continue to university, whereas only 74 percent of the males do so (MECTS 2010). In principle, state education is free of charge and based on equal opportunities; there are also places for the Roma within an affirmative action program. In reality, about half of the places in state universities are fee-paying, as the money coming from the national budget is not sufficient for the universities' survival. There are 56 state universities and 37 private universities listed on the Ministry of Education site (MEN 2016), and the total number of students reached 535,200 in the 2015–2016 academic year, down by 6,500 from the previous year. Fifty-four percent of those were women, and the most attractive specializations were business, management and law (24% of the total number of students), and engineering, processing, and construction (22.2%) (INS 2016).

Special Needs Education

Children with special educational needs are usually not integrated in mainstream schools (which lack even basic material resources for some of them, such as ramps or elevators). Most of these children, irrespective of gender, study in so-called special schools, although lately some parents have insisted on enrolling their special needs children in ordinary state schools. Legislation allows that, but problems are encountered at the level of perceptions of other parents, children, and even school staff and authorities.

Health

Romania has a national health system, whereby each employee is retained a percentage of their salary as health insurance. In principle, children under 18, senior citizens and retired people, and the unemployed (for the period in which they receive their unemployment benefit) are also covered by health insurance. However, access to health

services is de facto limited in rural areas (for lack of doctors and nurses) or due to other issues (e.g., lack of IDs).

In 2014, Romania contributed 4.5 percent of its GDP to Health (World Bank 2016), one of the lowest rates in the European Union. In addition to being underfinanced, the national health system is mined by corruption and deficiencies of all sorts. Lately, the press has been disclosing many cases of bribery in the allocation of resources, rigged public tenders, direct bribery to doctors in hospitals, and so on, and the National Anticorruption Directorate has been making steps in prosecuting those responsible.

The national health system, like education, is highly feminized: women represent two thirds of health workers (INS 2017), and their salaries are among the lowest in the state sector in the country: 68.8 percent of health workers have salaries under USD\$500 per month (Grunberg 2012, 10). However, the high-profile and high-status positions (hospital manager, chief of staff of hospitals, minister of health, etc.) are mostly held by men. Also, some medical fields, such as surgery, are occupied mainly by men, whereas most of the GPs (or family doctors) and pediatricians are women. For example, in 2010, there were 3,488 male and 11,022 female family doctors. It is similar for nurses: in 2010, there were 9,449 male and 104,503 female nurses (7).

Access to health is a fundamental human right, and women are affected threefold: as patients, as staff, and as informal caregivers (in their extended families). Female-specific illnesses are not given proper attention in Romania; for example, the maternal mortality rate is one of the highest in Europe, breast cancer incidence is significant, and uterine cervical cancer is also the highest. Occasionally, there are campaigns to sensitize the public—such as the cervical cancer immunization campaign for girls and young women—but they are episodic and not sustained (for example, the campaign mentioned above covered only the initial immunization and not the booster doses). As caregivers for other members of their families, women are directly affected by the lack of medical services and their high informal costs (Băluță 2011, 23–24).

Romania has the fewest number of practicing physicians per 10,000 inhabitants, at 22.69. (WHO 2016) Paradoxically, it also has the highest number of graduates from medical universities: in 2015, there were 27.1 medical graduates per 100,000 population, which is 4 times more than in France and 2.5 times more than in the United Kingdom (OECD 2014). One of the reasons is that many Romanian doctors have found jobs in other European countries or intend to do so; according to the MDs Professional

Organization, in 2014, 2,450 doctors requested documentation to work abroad (Colegiul Medicilor din România 2015). The main reasons put forward are the corruption in the system that leads to its chronic underfinancing, and hence small salaries, and low professional status of the medical profession.

Employment

The Romanian Constitution guarantees equal opportunities for all its citizens without any discrimination before the law and public authorities. Law 202/2002 specifically stipulates equality in employment between men and women, including equal pay for equal work. It also defines and prohibits any forms of discrimination, including sexual harassment. However, Romania ranks last in the European Union concerning the European Gender Equality Index, with 33.7 points, although there are more women than the European average engaged in full-time employment (42.5% in Romania, compared with 38.8% in the European Union) (EIGE 2015).

Regarding financial resources, Romania ranks last with 21.1, compared to the EU average of 58.0. So, women earn less than men in Romania, and both earn less than the EU average (EIGE 2015). Discrimination between genders in employment, wages, and pensions exists, mostly due to hiring, promoting, and firing women during pregnancy, but most of the cases are not reported. Regarding economic representation, women represented only 11.3 percent of board members for large listed companies in Romania, while the EU average is 21.2 percent (European Commission 2015). That means only 5 percent of women (i.e., four women) are presidents of boards of directors or supervisory boards; 10 percent (8 women) are general managers of listed companies; and 14 percent are on the boards of directors and supervisory boards for all listed companies (Deloitte Consulting 2015).

Statistics show that Romania had the lowest gender pay gap in the private sector in Europe at 4 percent; however, it was 18.5 percent in the public sector in 2014 (Eurostat 2015). There are highly feminized sectors, such as education, health, and social assistance, where salaries are much lower than in other state sectors (such as the army or the police). For comparison, personnel expenditure for the health sector was 0.05 percent of the state budget in 2008 and 0.03 percent in 2013, and for army personnel, it was 0.58 percent in 2008 and 0.43 percent in 2013 (Grunberg 2012, 11).

Family Life

The definition of the family in Romania is currently under debate, as the current Constitution describes it as the union between two spouses, but the Constitutional Court has admitted as acceptable a petition of 3 million signatures to impose the definition of the family as the union between a man and a woman, to oppose possible demands of same-sex marriage (July 2016) (Mediafax 2016). Recently, a gay couple (Romanian-American) legally married in Belgium and then requested the Constitutional Court to admit their marriage in Romania, but the court postponed the decision to November 2017. So, at the time of writing this entry, there has been no decision by the court. Consensual union and same-sex marriage are not legally recognized in Romania.

In general, Romania favors the extended family model, with three or even four generations living together, especially in rural areas, but even in urban areas, families have strong ties and often meet for family reunions and help each other financially and spiritually. More often than not, both members of the couple work, but the man is still traditionally regarded as the head of the family. Women suffer the double burden of household chores and paid work outside the home; they are expected to do most (if not all) of the child care and also to take care of other members of the family who are in need.

An important aspect is the allocation of time in the family, as Romanian women are above the EU average regarding time allocated to child care (48.6% compared to 44.6%, respectively), but not with domestic activities (73.2% in Romania as compared to 77.1%, the EU average). In their turn, Romanian men spend much less time engaged in these activities: 17.9 percent (27.4% is the EU average) in child care and 13.1 percent in domestic activities (24% is the EU average). Very few women (or men) in Romania take part in sport, culture, or leisure activities (1.3%) or in volunteering and charitable activities (6.5%) (EIGE 2015).

In the 2011 census, 61.1 percent of the total population of Romania consisted of married couples, whereas there were only 5.4 percent divorced people. There was a drop in the rate of marriages to 5.2 marriages per 1,000 people in 2011. There are 1.08 children on average in a household (Eurostat 2015). A woman gives birth to 1.33 children on average (CIA 2015).

Politics

Although the right to vote was granted to Romanian women in 1938, they did not in fact benefit from it, as Romania crossed several dictatorial regimes between 1938

and 1989. During the communist regime (1945–1989), gender balance was observed, with 35 percent of women in the communist parliament. But the model imposed by these women, one example being Elena Ceaușescu (Nicolae Ceaușescu's wife), was generally symbolically rejected by the population. After the 1989 revolution, the political representation of women dropped significantly, so that in the latest legislature, 2012–2016, only 11.5 percent of the Parliament was represented by women (7.35% in the Senate and 13.35% in the House of Representatives). The lowest representation of women in Parliament was 1992–1996, at 3.7 percent (Camera Deputaților 2016; Senat 2016). In December 2015, one of the main political parties in Romania, the National Liberal Party (PNL), proposed a law in Parliament that would impose gender quotas of 30 percent for women in political representation, but as the law was not discussed, it had no direct consequences for the elections in 2016.

The Gender Equality Index in the area of power for Romania is the lowest in the European Union, at 19.2, with the EU average at 49.8 (EIGE 2015). This means that Romanian women are poorly represented in political life, both at the central and local levels. There are changes taking place, however, especially in the executive branch, as approximately 25 percent of the current government positions are filled by women (Guvernul României 2017).

LGBT Rights

Same-sex marriage is not recognized in Romania. In fact, up until 2001, Romania criminalized same-sex relations by one to five years in prison. Article 200 of the Penal Code was introduced under Nicolae Ceaușescu in 1968 and was amended in 1996 under pressure from the Council of Europe, decriminalizing sex in private between two consenting adults. However, public display of same-sex sexual conduct or even private, if it had caused a “public scandal,” continued to be punished by prison. This article was abrogated under pressure from the European institutions in 2001.

Romania is a highly conservative society, as shown by a survey conducted on the European Union in 2015, where Romania showed one of the most conservative attitudes toward the LGBT community. For example, Romania is the only EU country where levels of discomfort at working with LGBT people are rising, while only 45 percent agree with including diversity information in school lessons and material (European Commission 2015).

Sexuality and Reproduction

The information on health, sexuality, and reproduction is very scarce, and there are no dedicated classes or topics in textbooks in state schools in Romania at the moment. In 2015, there was a national appeal from the Gender Equality Coalition, supported by 56 NGOs, to introduce education for sexuality as a compulsory subject in schools, with the aim of promoting mutual respect between partners in a relationship and excluding all forms of violence, while teaching about contraceptive methods and sexuality abuses. Other NGOs rapidly countered with the position that such education should be made within the family and not at school. Abortion became legal in 1989 and is performed in state and private clinics for a small fee.

Pronatalist Policies and the Aftermath

Control over reproduction and sexuality was done in communist Romania through a network of laws, decrees, norms, and instructions implemented through a complex system of checks, controls, and sanctions. Health education and birth control were state and Communist Party policy. Everything was decided in the party offices and transmitted to the population through propaganda institutions. Thus, as the only shops were state ones, contraceptives were not available in them; one could only obtain them illegally on the black market, and they were of very low quality. Sexuality and contraception were taboo topics, and even art was censored so as not to express any detail connected to sexuality.

In this context, Nicolae Ceaușescu proposed and passed a law to regulate reproduction even further. This was the infamous Decree 770/1966, with subsequent modifications in 1974 and 1985, the main instrument through which women were obliged to give birth to at least four (the number was subsequently increased to five) children by the age of 45 to benefit from the only legal contraception method available at the time: abortion. These provisions must be corroborated with the inexistence of health education in schools to fully understand its effects.

In parallel, a vast system of supervision and control was implemented by involving the state police, the prosecutor's office, and Communist Party leaders. Women who had suffered illegal abortions were submitted to long interrogations by prosecutors and the militia in hospitals before allowing them to be examined by a doctor. They were asked the names of the doctors or midwives who had performed the illegal abortion and whether their husbands

or partners had known about it in order to prosecute and imprison them as accomplices. In this situation, most women preferred to keep silent, and thus medical intervention was postponed until it was too late. The deaths of these women were labeled in hospital documents as "due to woman's fault" (Doboș 2015, 171–200).

Control of reproduction has to be placed in the general context of Romanian society of the time: shortages of all sorts; lack of minimal decent living conditions (of basic food, medicines, heating, electricity, or hot water); and problems in the health, education, and transportation systems, among others. The main immediate effect was a growth in the number of unwanted children, many of them abandoned in maternities or in state institutions. There was also an increase in maternal and infant mortality and in the births of children with physical and psychological disabilities. Moreover, incidents of depression, nervous breakdowns, sexual issues, and women's social isolation were frequent. All these were determined effects of pronatalist policies in society as a whole.

The effects of the incrimination of abortion were felt by their partners and by their families, as well. For the majority of citizens, modern contraceptive methods were not generally available. Consequently sexual intimacy was tarnished by the fear and the anxiety of the risk that any contact could result in pregnancy. Against propaganda representations of the paternalist state, who was supposedly taking care of the wellbeing of its citizens, the over praised optimal conditions to develop healthy and numerous families were simply not there for most Romanians. (Kligman 2000, 223)

The effects of pronatalist policies (1966–1989) have continued and are still felt at the present time. For example, there was continuous use of abortion as the main contraceptive method throughout the 1990s, well after its becoming legal (in 1990, the number of abortions surpassed the number of births by three to one), because of not having health education in schools. Also, there was the situation of adoptions, or even the commodification of children, a phenomenon of the 1990s in Romania, where a number of poor families gave their unwanted children up for adoption. At present, there are other effects of pronatalist policies, such as the change in marriage patterns or a great number of mature single women (when the generation born in the maximum boom period—1967 to 1970—reached adulthood). In the long term, there is concern

regarding the state pension system, as this generation will reach retirement and their pensions will not be supported by the working people.

Religious and Cultural Roles

According to the 2011 census, 86.45 percent of Romanians say they are Romanian Orthodox, 6.62 percent are Roman Catholic, 3.2 percent are Reformed, and only 0.21 percent are atheist or without religion (INS 2013). In the Romanian Orthodox Church (similar to Russian or Greek Orthodox), women have a secondary role. They cannot be ordained as priests; they can only be nuns and live a secluded life in a monastery. Moreover, women are supposed to obey their fathers and husbands, are not allowed to enter the altar, and are forbidden to enter the church when menstruating.

However, as Romanian Orthodox priests cannot be ordained unless married, their wives have an important role in local communities: they are supposed to do charity and take (informal) care of local parishioners. Also, women are the backbone of the Orthodox Church, as they do all the work needed in the church and on its premises. When visiting an Orthodox church, one is surprised by the number of women doing all sorts of chores: cleaning, tidying, selling candles and icons, and so on.

Issues

Risk of Poverty and Social Exclusion

There are many concerns regarding the risk of poverty and social exclusion in Romania. Most of them come from the former communist regime, as practically all the population (with the notable exception of the Communist Party *nomenklatura*) lived in scarcity of basic human needs, such as basic food, hot water, heat in winter, or basic medicine. However, the transition period (after 1989) did not bring significant developments in improving living standards for almost half the population. When Romania joined the European Union in 2007, the situation was expected to improve, but due mostly to extended corruption, it has not. In 2015, 47.3 percent of the population of Romania was at risk of poverty and social exclusion (Eurostat 2016a), which is the highest rate in the European Union. Also, in 2015 46.8 percent of children were at risk of poverty and social exclusion, again the highest percentage in the European Union (Eurostat 2016b).

Poverty remains one of the causes of separation of children from their families (40%), followed by disability (26.82%), and abuse and neglect (9.54%) (UNICEF 2015).

There is also an increasing number of reported cases of violence, from 8,142 cases reported in 2010 to 10,207 in 2015, including situations of neglect, from 5,494 in 2010 to 7,270 in 2015 (UNICEF 2015).

Violence against Women

One in five (17.8%) women in Romania admit to having been subjected to at least one form of violence in the family, but the numbers are believed to be highly underreported. There have been several incidents in the press where women were killed by former or current husbands or partners, although they had requested police help and restraining orders had been issued. However, the police had not put those in place, and tragedies happened.

At the pressure of NGOs and the civil society, the government adopted a National Strategy to Combat Violence within the Family (2013–2018), which should improve legislation in the domain of family violence, change perceptions and tolerance toward family violence at the general level of Romanian society, and strengthen the institutional capacity of the state to combat violence and protect the victims.

Russia

Overview of Country

The Russian Federation, or Russia, stretches over northern Eurasia and borders Norway, Finland, Estonia, Latvia, Lithuania, Poland, Belarus, Ukraine, Georgia, Azerbaijan, Kazakhstan, China, Mongolia, and North Korea. It also shares maritime borders with Japan and the United States. With a territory of 6,612,100 square miles (17,125,200 sq. km), Russia is the largest country in the world. As it borders both the Arctic and Pacific Oceans, the country spans 11 time zones. Its terrain varies from flat tundra to some of the highest mountains in the world, and its climate ranges from polar to subtropical. Around 70 percent of Russians reside in urban areas, and in October 2010, Russia's population was 142,856,536, making it the ninth most populous nation (Russian Census 2010).

Russia's history dates back to the 9th century, when Eastern Slavs—the ancestors of modern Russians—established their first state of Kievan Rus', with the capital in Kiev (now Ukraine), and invited the Viking leader Rurik to be their ruler. In the 13th century, Kievan Rus' yielded to the Mongol invasion, which destroyed Kiev and devastated the country. In the 300 years of Mongol domination, the new center of Russian sovereignty eventually formed around the Grand Duchy of Moscow. After the Fall of Byzantium in 1453, Moscow's Duke Ivan III claimed his state a successor to the legacy of the Eastern Roman Empire; by that time, it had absorbed most neighboring principalities and thrown off the Mongol yoke, allowing the duke to become the sovereign of all Russians. The 16th century marked Russia's territorial expansion and the change of its status to czarism. Ivan IV, also known as Ivan the Terrible, was the first to be crowned as czar (caesar), and his rule included the colonization of Siberia and the conquest of Russia's northwestern territories.

The demise of Ivan's sons ended the Rurikids' reign, who, after the brief yet devastating "Time of Troubles," were replaced by the Romanov Dynasty in 1613. In the late 17th century, Peter the Great sought to modernize Russia by modeling it after Western European nations. He founded the new capital of Saint Petersburg and orchestrated a series of extensive social reforms, set to transform every aspect of the Russian life. Having fought and won a 21-year war with Sweden, Peter secured Russia's access to the Baltic Sea, thus ensuring its connection with the major European thoroughfare and symbolically making Russia part of Europe. He also claimed an imperial status to the country, thus starting two centuries of the Russian Empire.

The imperial period ended in 1917, following Russia's debilitating losses in the World War I and the Bolshevik Revolution led by Vladimir Lenin and Leo Trotsky. The revolution resulted in mass emigration and civil war, and the communists remade Russia into a socialist country. Often regarded as the greatest and the largest social experiment of the century, the 70 years of state socialism in Russia was a kaleidoscope of turbulent events: rapid national modernization, followed by the rise of Stalin's totalitarian terror; the brutal loss sustained by the country in World War II; the consequent exhausting decades of the Cold War; and the gradual stagnation and deterioration of the state economy by the early 1990s.

After the dissolution of the Soviet Union in 1991, Russia was stuck with a legacy of social, political, and economic

issues. The initial aspiration was that the country was transitioning to capitalism and democracy. However, since President Vladimir Putin's ascendance to power in 2000, most scholars agree that Russia's current political regime can be best described as a hybrid one, with elements from both democracy and autocracy. It is a semipresidential federation, consisting of 81 federative units, such as provinces, republics, autonomous regions, and federal cities. The state's capital is Moscow. Along with Saint Petersburg—the country's former capital and the second-largest city—Moscow is the most economically developed part of the country. Russia's main legislative body is the State Duma, to which representatives are democratically elected once every five years. The president of Russia is the chief of the executive branch of the government and the *de facto* national leader. From 2000, Vladimir Putin has been the country's president, leaving the office in 2008–2012 to comply with the constitutional prohibition on more than two consecutive presidential terms and returning in 2012 for a third term. Dmitry Medvedev, Putin's presidential “stand-in” in 2008–2012, is currently the prime minister and the leader of United Russia, the country's most powerful political party.

Most of Russia's gross domestic product (GDP) comes from oil and natural gas revenues; in 2015, these profits were USD\$1.283 trillion, ranking Russia's economy 12th in the world (World Bank 2017). The combination of the exhaustion of the commodity-based economic model employed by Russia and the economic sanctions imposed on the country following its aggression in Ukraine in 2014 has resulted in the steep decline in the national economy, devaluation of the ruble, increasing international isolation, and the possibility of recession in the near future.

Russia is a multiethnic country populated by approximately 160 ethnicities who speak more than 150 languages. More than 80 percent of the country's population identifies as ethnically Russian. Other large ethnic groups include Tatars, Ukrainians, Bashkir, Chechens, and Armenians. While bilingualism is common in many regions, Russian is the country's only official state language. There are four state religions in Russia: Orthodox Christianity, Islam, Buddhism, and Judaism; religious leaders from each have been supportive of the government, endorsing its conservative social policies. At the same time, levels of xenophobia in Russia are high, with racism, Islamophobia, and antimigrant prejudice on the rise. Given that Russia has significant numbers of non-Slavic visible minorities, such as predominantly Muslim worker migrants from

Central Asia, social tensions are strong, and the government does little to address these problems.

Overall, Russian society combines both modernist and traditionalist tendencies, and while formally equal in rights and opportunities to men, Russian women face multiple issues, such as the lack of political representation, latent discrimination, the pressure of traditional stereotyping, and domestic and intimate violence. Women from the North Caucasus region, migrant women, women with disabilities, and transgender and nonheterosexual women are the most vulnerable. In 2014, the UN Development Programme (UNDP) ranked Russia 54th out of 188 nations based on the Gender Inequality Index (GII; 0.276). Beginning in the mid-2000s, and especially after Putin's return to presidency for a third term in 2012, there has been a visible turn toward more conservative and authoritarian practices in every level of Russian society. The situation was aggravated in 2012–2014, when Putin's return to power was accompanied by the adoption of a series of legislative acts aimed at disassembling the nascent civil society and limiting the personal freedom of Russians. Laws were enacted to protect “religious feelings,” to ban “gay propaganda,” and to limit women's access to abortion—all seen as attempts to crack down on public dissent and straighten the conservative tendencies in the society.

Girls and Teens

Overall, girls in Russia enjoy relatively high social protection and opportunities in the areas of education and recreation. Primary and secondary school attendance is nearly universal, resulting in literacy rates of 99.6 percent for girls and 99.7 percent for boys (UNESCO 2016). The expected years of schooling for girls (15.1) are higher than for boys (14.9) (UNDP 2016). Moreover, according to the 2012 Program for International Student Assessment study, Russian girls perform slightly better than boys in math and are significantly better in reading (OECD 2016). Russia does not have an educational program specifically aimed at girls, but as a continuation of the Soviet tradition of “pioneer palaces”—neighborhood clubs for hobbies and recreation—all children are encouraged to participate in a wide range of mostly state-subsidized extracurricular activities; yet, the availability of those varies depending on the location. Most of the extracurricular clubs are coed, and girls engage in various sports, fine arts, music, dancing, and sciences.

Women's Voices

Sapiyat Magomedova

Sapiyat Magomedova was born in February 1979 in Khasavyurt in Dagestan (Russia). She became a key defender of victims of torture by police for suspected involvement in the insurgency and of violence based on gender and sexual identity. Magomedova chose to stay in her home province of Dagestan, despite describing her life there as “no life” (Civil Rights Defenders 2012).

On June 17, 2010, police in Khasavyurt beat Magomedova unconscious inside the police precinct for refusing to leave after she was denied access to her client who was being detained there (HRW 2010). Because of this beating and other threats to her safety, the Lawyers' Rights Watch Canada group called for an investigation into the violence against Magomedova in a written prospectus to the president, chairman, and prosecutor general of the Russian Federation/North Caucas (LRWC 2013).

Of her work, Magomedova said, “To say that I am not afraid would be wrong. But it is a healthy sense of fear. Fright can either mobilize or paralyze. I dare to hope that it mobilizes my strength” (Civil Rights Defenders 2012).

—Karen J. Shaw

Sex education and teenage sexuality in general are contested topics in Russian society. Sex education is absent from the secondary school curricula. Moreover, Pavel Astakhov, the Children's Rights Commissioner in 2009–2016, openly opposed the very idea of sex education in schools, stating that it would lead to promotion of immoral behavior. Instead, he proposed to introduce courses on

abstinence and family values. The Russian Orthodox Church also attempted to interfere and influence secondary education, promoting abstinence and modesty as the preferred modes of sexual behavior for young women.

In practice, though, such tactics are clearly not efficient: Russia has a relatively high number of teen pregnancies. According to a 2012 report, 24 percent of teenage girls 15 years and older were sexually active, with a median age of sexual debut being 17–19 years (ICO 2016). In 2015, there were 25.7 births per 1,000 girls ages 15–19 in Russia (UNDP 2016). *The 2015 Demographic Yearbook of Russia* suggests that there was a 6 percent decrease in adolescent births over the past 10 years; however, this might be due to the decreased numbers of teenagers, not effective social policies (FSSS 2016).

Russian children live in a nation where corporal punishment of children is not forbidden and is actually seen as a proper method of child-rearing. For the past 10 years, Russian conservatives have been actively resisting the introduction of the juvenile justice system, fearing, among other things, that it might lead to outlawing corporal punishment. Also, the 2013 introduction of the so-called ban on propaganda about nontraditional sexual relationships to minors, popularly known as the gay propaganda ban, has affected the well-being of nonheterosexual and gender nonconforming teenagers, as now they cannot receive any positive information about nonnormative sexuality or gender identity. Moreover, they are unable to receive any medical help or counseling in regard to their sexuality and gender identity issues, as such help would be understood as a violation of the gay propaganda ban. In Russia, where homophobia and transphobia are everywhere and bullying is not regarded a social problem, nonheterosexual children and teenagers are especially vulnerable to violence and abuse.

Health

Despite universal health care and a long tradition of quality medical training and research, Russia continues to face multiple issues in its population's health. The economic instability and growing corruption of the 1990s led to a crisis in the health care system. Widespread alcohol and tobacco abuse and environmental problems have also been contributing factors to the multitude of health issues faced by Russians. For a developed country, life expectancy in Russia is quite low; for 2015, it is estimated to be 70.1 years (UNDP 2016), making Russia 153rd in the world. As typical elsewhere, female life expectancy is higher than that of

males, 77 years versus 65 years in 2016, respectively (CIA 2017).

According to the World Health Organization (WHO) data, 53 percent of Russian adult men smoke tobacco regularly, and around 30 percent engage in heavy drinking at least once a month. Furthermore, Russian men consume 32 liters of pure alcohol per year, and 31 percent of adult men have had alcohol use disorders, including dependency (WHO 2014a). Researchers explain such high rates of alcoholism and tobacco use among Russian men by the existing gender stereotypes that encourage them to neglect health problems and engage in drinking and smoking—behaviors commonly seen as signs of “proper” masculinity. As of 2016, 17 percent of women smoke regularly and consume around 13 liters of pure alcohol in a year; 10 percent have engaged in heavy drinking, and 6.2 percent have had alcohol use disorders, including dependency (WHO 2014b; WHO 2017). Overall, Russian women’s alcohol and tobacco use are lower than the regional averages (in Europe, 19% of women smoke, and 7.5% have alcohol use disorders) but higher than WHO global data (7% for smoking and 2.9% for alcohol use disorders in 2010, respectively).

Health problems faced by Russian women include the growing epidemic of HIV/AIDS, high rates of breast cancer, and absence of a human papillomavirus (HPV) vaccination program. The law in Russia forbids female circumcision (i.e., female genital mutilation or cutting (FGM/FGC)); yet, in predominantly Muslim regions, such as Chechnya and Dagestan, it is sometimes encouraged by religious leaders under the pretense of tradition and is known to have been performed there.

Access to Health Care

As a part of the Soviet legacy, Russia has universal free health care, but its quality and accessibility vary. In 2013, Russia spent 6.5 percent of its GDP on health expenditures (CIA 2017). In 2008, there were 621,000 doctors and 1.3 million nurses in Russian health care. The number of doctors per 10,000 people was 43.8, but only 12.1 in rural areas. The number of general practitioners as a share of the total number of doctors was 1.26 percent. In 2014, the country had about 8.8 beds per 1,000 people, nearly double the Organization for Economic Co-Operation and Development (OECD) average, but that is a decrease from 2006, when the ratio was 9.7 (OECD 2016; CIA 2017).

The Russian health care system is currently facing such major problems as understaffing, underfunding, and

corruption. The availability of specialized medical facilities is uneven and has traditionally been most adequate in Moscow and Saint Petersburg, where only 12 percent of the population resides. While a visit to a primary care provider is not a difficulty for most Russians, a visit to a specialist often assumes signing up for a slot on a waiting list, sometimes more than a month ahead of time. Both consultation visits with specialist doctors and lifesaving procedures frequently require waiting lists and sometimes bribery. Because of the shortages of medications and medical supplies, it is not uncommon for patients to receive free medical services, such as consultation visits and surgical procedures, but then have to purchase supplies and medications. Patients with chronic and life-threatening illnesses, such as HIV or diabetes, are entitled to the state-subsidized medications, but they are affected by shortages as well. Sometimes patients are forced to pay for the drugs necessary for their survival out of their own pockets.

Another issue is the system of resident registration in Russia to record and control internal migration. The system makes most Russian citizens eligible for free health care only within the fixed borders of the community of their registered residence. Despite the Russian Constitutional Court prohibiting discrimination based on the absence of local registration, many health care practitioners still refuse to provide care free of charge to persons without such registration. Thus, moving away from the place of local registration, be it to another town or even to another neighborhood in a big city, can result in losing one’s eligibility for free health care in a new place of residence, unless the person registers with the local residence committee. The registration is a tedious procedure that requires a lot of paperwork and is sometimes complicated by corruption. The system makes migrant women especially vulnerable, as their access to health care is already complicated because of social exclusion.

As a retaliation strategy to the international sanctions imposed on Russia in 2014–2015, some Parliament members proposed a ban on medical imports in Russia from the countries participating in the sanctions. The proposal caused mass public dismay, as the state of the domestic medical industry is widely viewed as insufficient and falling behind international standards. The adoption of the ban would make lives of many vulnerable citizens, especially children with rare illnesses and their mothers, impossible, as they have to rely on imported medications to survive (Bigg 2015).

The state's response to the crisis has been a reform introduced by Vladimir Putin in 2011, which has led to the major restructuring of the national health care system. Whether the reform brings positive or negative changes remains yet to be seen. So far, the most palpable consequence in Moscow alone has been the consolidation of smaller hospitals into large systems, causing around 30 percent of the medical personnel to lose their jobs (Chizhova et al. 2014).

Maternal Health

Due to the nearly universal availability of maternal health care, Russia has a low maternal mortality ratio of 25 deaths per 100,000 live births, which is still higher than the European average of 16 deaths, but it is significantly lower than the global average of 216 deaths in 2015 (CIA 2017). Russia's infant mortality ratio is 7.4 deaths per 1,000 births, both live and stillborn is 8.6 (UNDP 2016). At the same time, Russia also has one of the lowest fertility rates in the world, which has been slightly increasing. In 2015, it was 1.61 children per woman, compared to the 2014 rate of 1.5 (CIA 2017).

Nearly every woman in Russia has visited a gynecologist at least once in her lifetime. According to the 2015 survey, at least 84 percent Russian women visit a gynecologist regularly, at least once every three years, but only 29 percent do it every six months, which is the WHO recommendation (Gedeon Richter 2016). Most women cite absence of health problems, lack of time, or unavailability of a good doctor as reasons for failing to comply with the recommendation.

When it comes to pregnancy and family planning, there are reproductive and family planning centers where women and their partners can receive information and advice on birth control and pregnancy and have certain medical tests done. All pregnant women are required to register at the state medical consultations—clinics where women can get obstetrical and gynecological services. These clinics are usually part of the system of local polyclinics or maternity hospitals. The registration of pregnancy is needed for statistical purposes as well as for eligibility for various social benefits, including child support, prenatal care, and maternal leaves. All pregnant women are required to be tested for HIV and other sexually transmitted diseases (STDs) and to visit a gynecologist regularly throughout the duration of pregnancy for health-monitoring purposes. Most women take prenatal leave during the third trimester of pregnancy

and are taken into prenatal care a few days prior to their due date. Midwife assistance and home births are rare but not explicitly prohibited. According to WHO, 99.6 percent of women receive childbirth assistance from medical professionals, usually giving birth in specialized maternity hospitals where visits by their friends and family members are often restricted due to health concerns. Most mothers are released from these hospitals within five days after childbirth.

As a fertility aid, Russian legislation allows a variety of artificial insemination methods, including donor sperm use, in vitro procedures, and surrogacy. There are no sperm banks in Russia; hospitals are the only places where frozen donor sperm can be accessed (Zhabenko 2015). Married couples and single persons alike can use the services of surrogate mothers. It is possible to receive the in vitro insemination procedure free of charge through the universal health care; yet, in 2013, only 0.5 percent of couples with infertility issues chose this method of artificial insemination. The numbers of surrogate births are even smaller: in 2013, around 400–500 children were born to surrogate mothers out of around 2 million total births (BBC Russia 2013). Surrogacy is not strictly regulated by the Russian legislation; however, since 2012, a woman cannot donate an egg and be the surrogate mother for the same pregnancy. In 2013, Patriarch Kirill, the head of the Russian Orthodox Church, opposed surrogacy and other methods of artificial insemination, but so far, the church's position has not had any legal effect on these matters.

HIV/AIDS

As of 2016, Russia has the fastest-growing epidemic of HIV/AIDS in Europe and the highest number of registered HIV cases—more than 1 million people, 200,000 of which have died as of 2016. Russia has both the highest HIV-positive population and the most HIV-positive young women. In 2014, 6.2 percent children born to HIV-positive mothers were HIV-positive as well. Just under 50 percent of HIV-positive Russians receive antiretroviral therapy (ART). Researchers argue that one of the reasons why young women in Russia have been affected by HIV at such a disproportionately high rate is the widespread and normalized culture of male infidelity: there is no official statistical data on the issue, but women typically learn that they are HIV-positive when they are pregnant and undergo mandatory HIV and STD testing. At the time of diagnosis, most of these women are married or have been in a monogamous heterosexual

relationship and are most likely to have received HIV from their nonmonogamous partners.

Such gender dynamics of power in HIV transmission make the prophylactic measures all the more inadequate, as the state-funded policies focus on the promotion of abstinence and heterosexual monogamy as preferred methods of HIV prevention. At the same time, the non-governmental organizations (NGOs) working within the sphere of HIV prevention and outreach severely lack funding. The “foreign agents” law, adopted in 2014, contributed to worsening the situation. According to the law, every NGO that receives funding from abroad and is engaged in political activities has to be registered as a foreign agent—a spy. Such a label imposes serious limitations on and control over an NGO’s actions, and as “political activity” is defined in Russia as vaguely as possible, many organizations involved in HIV-prevention campaigns have found themselves at risk of being labeled “foreign agents.” The law has also affected many international funding agencies, making them reluctant to provide grants to Russian NGOs.

Breast Cancer and HPV Prevention

Russia has one of the highest rates of breast cancer in the world, and the death rate from breast cancer is 22 per 100,000 women, making breast cancer one of the leading causes of death in the country and the most common cancer in women. Besides hereditary and environmental causes, the reasons for such high rates are inadequate access to the specialized cancer treatment facilities and the absence of a well-developed nationwide screening program. Only 60 percent of cases of breast cancer are diagnosed at localized stages, making the five-year survival rate lower and the mortality rate higher than, for instance, in the United States (WHO 2014b).

In contrast, Russia’s screening practices for HPV-related cancers are more advanced, and thus the death rate for cervical cancer is a relatively low 6.54 per 100,000 women; yet, the prevalence of the disease is still higher than in Europe or the United States (WHO 2014b). In 2012, around 72 percent of Russian women were screened for cervical cancer regularly every three years, and the overwhelming majority of women have been screened at least once. At the same time, Russia has yet to introduce the HPV vaccination program adopted elsewhere, as the Ministry of Health has not yet certified the HPV vaccine.

Overall, to improve the national health of Russians, prevention and screening programs for major disorders and

diseases must be expanded, and this might be the biggest challenge the Russian health care system has to overcome.

Women with Disabilities

Russia ratified the UN Convention on the Rights of Persons with Disabilities in 2012; yet, there is very little accessibility to public spaces for people with physical disabilities (Iarskaia-Smirnova 2015). Accessible housing, public transport, and wheelchair ramps in public buildings and services such as the use of Braille alphabet are rare. Because of the inaccessibility issues, family members of people with disabilities often transform their physical spaces without state support and by using whatever materials are available. Depending on the severity of their disability, disabled persons in Russia may qualify for various benefits, such as monthly pension, public transportation discounts, and housing assistance. To be eligible for these benefits, a disabled person must appear before a medical committee every year to determine whether the person’s disability is still present. Therefore, disability in Russia is understood in paternalistic and medical terms, as nondisabled experts apply their knowledge to determine who is disabled and to what degree as well as what needs to be done for the disabled to be able to work.

Persons with disabilities are rarely given a voice. Often-times, this leads to persons with disabilities facing stigma and social isolation. Prioritizing the disabled person’s ability to work has resulted in preference given to injured soldiers and workers, not women and children with disabilities, which leads to negative stereotypes. Furthermore, disabled women face the stigma of double inferiority because of the challenges to their economic and reproductive capacities. In large Russian cities, some women with disabilities and mothers of children with disabilities have been able to organize advocacy and community groups that provide programs on business, employment, health, and peer support. The availability of such groups varies and is usually limited to large urban spaces (Iarskaia-Smirnova 2015).

Education

The right to free secondary education is guaranteed by the Constitution of the Russian Federation and is regulated by the Ministry of Education and Sciences. Russia has a 100 percent primary school attendance, and the literacy rate is 99.7 percent for men and 99.6 percent for women, with

Can't Drive the Train

Education in Russia is organized and coordinated by the state to help ensure that general education is free and available for all. Most schools are state run, but private schools have also been established in recent years. According to UN census data, the Russian literacy rate, defined as citizens age 15 and over who can read and write, is 99.7 percent.

High educational attainment in the Russian population continues to increase. Eighty-eight percent of the adult population has attained at least upper secondary education, and 54 percent have earned a postsecondary degree. Women earn 57 percent of the postsecondary degrees awarded in Russia.

Although more Russian women than men have university degrees, on average, women make less money and hold less prestigious positions. Equality between men and women is guaranteed by paragraph 19 of Article 3 of the Constitution, but Article 253 of the Labor Code states that women should not perform "hard physical" labor or jobs "with harmful or dangerous labor conditions or work underground except for nonphysical jobs or sanitary and consumer services." Article 253 of the Russian Employment Code lists hundreds of jobs where the use of female labor is prohibited.

In 2009, Anna Klevets filed a demonstration suit after being turned down for a job as an assistant metro operator with the St. Petersburg metro. The Supreme Court rejected her complaint, citing Article 253. The case drew attention to a section of the Labor Code dating back to Soviet times, listing jobs deemed too dangerous or physically demanding for women, but the article has not been challenged since.

—Whitney K. Archer

average years of schooling amounting to 15 for both genders (UNESCO 2016). The percentage of the population that has university-level education is high, but the data is controversial. In 2014, the OECD estimated that more than 54 percent of Russians have attained some higher education, ranking Russia as the country with the highest number of university-level degrees per capita. This widely cited statistic seems doubtful, given that the Russian census in

2010 found only 21–25 percent of the population had university degrees (Russian Census 2010). All surveys agree: women and men achieve primary and secondary education equally; but female students make up 58 percent of the students, and women ages 25–29 have the highest rates of university-level education (OECD 2016; Russian Census 2010).

In 2012, Russia spent 4.2 percent of its GDP on education, which is still less than most developed nations' average spending. While private schools are becoming more common, most Russians receive secondary education in state schools for free, paying only 5 percent of the education-related costs. At the same time, around 17 percent of all university students attend private universities, and over 35 percent of all university education costs are paid for from private funds, which is one of the highest numbers in Europe. Following the 2012 reform of higher education, 60 percent of all university students must pay their way through universities. Thus, as students from poor families may no longer be able to afford tuition and related costs, higher education in Russia is becoming increasingly classed and less of a vehicle of upward mobility than it used to be in the Soviet Union.

Most institutions of secondary and higher education are state funded, with most being under the jurisdiction of the Ministry of Education and Science. However, there are military educational institutions under the jurisdiction of the Ministry of Defense. Out of 26 military universities and academies, only 8 admit women, and only to a limited number of areas of specialization. For instance, the S. M. Kirov Military Medical Academy in Saint Petersburg admits women to study nursing, but not medicine; hence, women are encouraged to become nurses in military hospitals—a profession traditionally ranked lower than that of doctors—but they cannot become army doctors.

Education in Russia consists of nursery (ages 6–18 months), kindergarten (ages 16 months–7 years), secondary school (roughly, ages 7–14 years), high school (ages 15–18 years), and professional training (universities, polytechnics, and vocational schools). As of 2007, 11 years of full secondary education is required for all children.

Kindergarten

The Soviet child care system provided nearly full-time facilities to assist working mothers. Contemporary preschool child care still consists of nurseries (for children ages 1–3) and kindergartens (ages 3–7). Parents pay 20

percent of kindergarten costs, and the rest is subsidized by the state. The children of university students, refugees, and other socially protected groups receive preschool child care free of charge. Depending on the institution, preschool education prepares the students for school and may include basic literacy and math skills as well as foreign languages and sports.

Following the increase of birth rates in 2005, kindergarten availability has become an issue. In urban areas, waiting lists were sometimes as long as 15,000 children. Most parents sign up for the kindergarten waiting lists as soon as their children are born, and in some neighborhoods, kindergarten is not available. The situation is complicated by the spread of corruption, in the form of bribery, when parents are encouraged to pay kindergarten directors and local authorities to secure slots for their children.

Secondary School

As of January 2010, there were over 53,000 schools in Russia, of which 34,000 are rural and 19,000 are urban schools. As of 2015, there were 13.36 million students in Russian schools, and 25 percent of schools operate in shifts. The overwhelming majority of public schools are coed. Secondary school consists of primary (grades 1–4), middle (grades 5–9), and senior (grades 10–11) school. Most children attend schools that provide full secondary education. Schools that specialize in primary or middle education are only located in rural and remote areas. Boarding schools are not common overall, but they are typical for remote areas, usually in Russia's Far North, to provide education for the children of nomadic nations. There are also specialized boarding schools for gifted children, for instance, for those who wish to train professionally in classical ballet or to study advanced computing. Finally, children with disabilities often attend specialized schools or receive visits from teachers in their homes. Both approaches have been criticized, as they lead to social isolation and contribute to the stigma of disability. The Ministry of Education and Science has only recently started addressing the problem of inclusivity and has launched several programs of inclusive education where children with disabilities attend regular schools.

The academic year begins on September 1 and ends in early June. The curriculum is comprehensive, with emphases on the humanities and natural sciences as well as physical education. At least one foreign language is taught, with English being the most common, but other popular

languages include French and German; Finnish, Chinese, or Japanese instruction is less common. Students usually have no choice of subjects to study; yet, it is possible to choose a school that specializes in one or another subject, commonly in senior grades. In addition to general and specialized schools, there are gymnasiums and lyceums that provide either advanced learning in certain subjects, such as the sciences or humanities; extracurricular; or vocational training. Some schools collaborate with universities, which may then give preference to their graduates.

As students graduate from grade 11, they take final exams in the form of the Unified State Examination (USE)—a set of standardized tests set by the Ministry of Education and Science. All students take the USE in math and Russian language to graduate. The test is universal in content and given the same day for all students in any given year. It is similar to the British A-levels and North American SATs and also serves as the university entrance examination.

Cases of open discrimination against girls in secondary education are rare; yet, some have caused public controversy. For instance, in Kazan, in 2012, no girls were admitted to the newly opened IT lyceum—a specialized boarding school founded in collaboration with Kazan Federal University. The lyceum was envisioned as a prestigious preparatory school for the gifted children from across Tatarstan. The admission to the school was competitive and included several rounds of extensive examinations and interviews. Once the examinations were over, parents of the girls who applied to the lyceum found out that their daughters were not admitted despite having passed the examinations with higher test scores than some of the admitted boys. Tatarstan, traditionally a Muslim region of Russia, is currently undergoing a revival of Islamic values, which was used to explain why the lyceum administration did not want to allow for the coed classrooms in the new school. As the controversy attracted more public attention, the administration was forced to promise to admit girls for the next academic year. As of 2015, there are 11 girls out of 277 students in the Kazan IT lyceum.

Russian secondary education has its strengths and weaknesses. Despite nearly universal attendance and literacy, some studies show that Russian students have lower cognitive skills compared to students of other developed nations (OECD Better Life Index 2016). One significant problem is that the school curriculum is affected by the political situation in the country. Neoconservatives have tried to “unify” school textbooks and curricula, especially

in social sciences, to reflect the government's perspective. In 2013, President Putin proposed a unified history textbook that would offer a "canonical" interpretation of Russian history. The minister of education supported the initiative, adding that such a textbook would not only teach students historical facts but also create a "unified historic, cultural and moral baggage that would play an important role in the formation of the Russian identity, love for the motherland and pride in its history" (NEWSru.com 2014). The idea was met with public criticism, as experts argued that it is impossible to offer just one perspective on history and that such a textbook would only teach students political propaganda. In 2014, the Ministry of Education abandoned the idea of a unified history textbook in favor of a range of textbooks based on the unified "cultural and historic" standard (TV Rain 2014).

Another "political" problem in Russian secondary education is the lack of schools where the primary language of instruction is not Russian. There are more than 150 languages spoken in Russia, and most are offered as optional subjects in regional schools, where said languages are native to the population. However, the number of schools with the primary language of instruction being other than Russian is small, and instruction is only available in Tatar, Bashkir, and Yakut. The official explanation of the Russian government for this policy is that children who are primarily taught in a language other than Russian would be at disadvantage in higher education and employment.

University Education

Higher education in Russia has always been regarded as a great social value. In 2008, there were 1,134 universities, both state funded and private, attended by 8.1 million students. Currently, the Ministry of Education and Science has been campaigning to reduce the total number of universities through consolidation of smaller schools into federal "behemoth" universities; yet, the ratio of universities in Russia to its population is comparable, if not smaller, than that of the United States or China.

Upon graduation from high school, students wishing to continue their education at universities take a USE standardized examination in subjects established by the university they wish to apply to. The USE score applicants receive determines whether they are eligible for a tuition waiver and a small stipend or whether they have to pay. Most public universities also provide a tuition waiver or reduction opportunity for high-performing students.

Traditionally, university education in Russia was a single program that lasted 5–6 years of full-time study and resulted in a "specialist diploma," roughly equivalent to the combination of Western bachelor's and master's degrees. Currently, Russia is transitioning to the Bologna system of university education. Beginning in 2007, most Russian universities offered a four-year bachelor's program followed by a two-year master's degree, and the traditional "specialist" degree has been largely abandoned. Transitioning to the two-stage Bologna model and recent reforms have caused an increase in educational costs, making higher education less available to economically vulnerable applicants. Besides, a bachelor's degree alone is considered widely useless, and scholarships for the master's degree are rare; thus, free education has become largely unattainable. Other forms of postsecondary, nontertiary education include nursing schools, vocational schools, and certificate programs. Quite often an abridged version of the general curriculum is taught in all of those.

Higher education for women started in Russia in the second half of the 19th century, when the "women's higher courses" were opened in several Russian cities. Following the Bolshevik Revolution in 1917, most institutions of higher education, such as universities and medical and polytechnic schools, became coed. While in the Soviet period, the rate of male university students and graduates was slightly higher than that of female students. In 21st-century Russia, the overall number of female students has overtaken that of males in both enrollment and graduation rates. Yet, there is still strong and visible gender segregation in areas of study.

In 2013, around 65 percent of all bachelor's degrees earned by women were in social sciences, the humanities, and education; yet, only 35 percent of sciences and engineering diplomas went to women (OECD 2016). In the same year, women earned 88 percent of all bachelor's degrees in services and health care, 80 percent in education, 64 percent in the arts and the humanities, and only 25 percent in computing. As a result, women often find jobs in lower-paying state-funded health care, social services, and culture and the arts; thus, women in Russia are often better-educated than men, but they earn less. Women who go on to graduate studies experience discrimination in applying for postgraduate studies, as the status of being a full-time postgraduate student protects male students from conscription, which is still mandatory in Russia. Hence, admission committees to postgraduate programs are commonly inclined to give preference to male applicants over females, especially if bribed.

Employment

Participation of Russian women in the labor force is laden with contradictions. For one thing, despite its low Gender Equality Index, Russia has high participation of women in wage labor. According to various statistics, in 2013–2014, 68–76 percent of women aged 16–54 were economically active versus 83 percent of men aged 16–59 (FSSS 2016; OECD 2016). Moreover, women are better educated than men, and there are six women for every five men among middle-aged workers in the prime of their careers. The 2014 International Business Report ranks Russia first in the world with respect to the proportion of women in senior management positions, stating that Russian women hold up to 40 percent of all Russian CEO positions. The UNDP ranks the Human Development Index (HDI) of Russian women higher than that of men, 0.804 and 0.789, respectively. The unemployment rates are slightly higher for women than for men; in 2014, 5.3 percent of women were unemployed (OECD 2016). Nevertheless, Russian women still earn just around two-thirds of men's salaries; moreover, women with children are more vulnerable to both unemployment and poverty. Several factors contribute to these contradictions: inequality at home, employment discrimination, and job segregation (Nechemias 2016).

Inequality at Home

In many aspects, Russia inherited Soviet patterns of women's employment. In the Soviet Union, women's participation in wage labor was modeled after the concept of the working mother, located at the intersection of socialist ideology and biological assumptions. Universal participation in labor was seen as a moral duty of every citizen of the workers' state. Yet, women's underrepresentation in high politics and among prestigious positions (factory managers, etc.) was explained by the "natural" differences between the two sexes and women's desire to care for their families. Moreover, the integration of women in the labor force did not challenge domestic patriarchy, and like many Western women, their Soviet counterparts worked a double shift: in addition to their paid labor, women had domestic duties as well. In contemporary Russia, the general attitude toward women's employment remains the same.

On the plus side, and also a Soviet legacy, Russia has one of the most woman-friendly maternity and parental leave policies in the world. The maternity leave lasts up to 20 weeks, during which women receive 100 percent

of their average salary, albeit with a ceiling. Following maternity leave, women, as well as other family members, can take up to 156 weeks of parental leave during the first 78 weeks, of which they get paid 40 percent of their average wage, again, with a ceiling. The Labor Code of Russia prohibits employers from firing a pregnant worker and requires them to hold the woman's job for the duration of both paid and unpaid leaves. Some argue that these policies actually increase the hiring discrimination, as many employers are not interested in hiring a worker who can potentially get pregnant and leave the company for up to three years.

Nevertheless, the deterioration of social welfare in the 1990s also contributed to the challenges faced by working women balancing careers and family life. The child support women receive during maternity and parental leaves is often insufficient, and child care availability varies. In 2016, maternity leave child support was, depending on a woman's employment history and wage, 544–21,554 rubles per month (USD\$8–\$337). As a comparison, according to the Federal State Statistic Service, an average monthly wage across Russia in January 2016 was 32,122 rubles (USD\$502). Waiting lists for nurseries and kindergartens are common, forcing some women to take longer unpaid parental leave, thus becoming dependent on other family members and losing labor skills. Still, most Russian women are working mothers.

Employment Discrimination

Equality between men and women is guaranteed by paragraph 19 of Article 3 of the Russian Constitution, according to which, "men and women enjoy equal rights and freedoms and have equal possibilities to exercise them." Despite the constitutional promise of equality, Article 253 of the Russian Employment Code lists 456 jobs—such as firefighting and operating a subway train—"where the use of female labor is prohibited." The legislation, inherited from the Soviet period, bans women from occupying certain professions under the pretense of the threat they pose to women's health, especially the reproductive system. Most of the professions closed to women—metallurgy and the mining industry, for instance—are lucrative; therefore, keeping women from these areas contributes to widening of the gender gap pay. The prohibition was challenged in court in 2009 by a Saint Petersburg woman who was banned from working as a subway train operator. The court ruled against her.

Both older and young women are vulnerable to discrimination. The Labor Code of Russia entitles women to an early retirement at the age of 55, which is seen by some as a discriminatory policy to weed out older women from the labor market. Due to economic difficulties and insufficient state pensions, most women choose not to retire and continue working instead. In the age group 55–59, workforce participation rates have risen from 39 percent in the year 2000 to 55 percent in 2013 (FSSS 2014). For women in the age group 19–22, labor participation has lowered from 16 percent in 2000 to 8 percent in 2013, partly due to higher rates of university enrollment and partly because of difficulties in finding a job. Cases of latent discrimination in hiring practices against young women are especially common. Many employers are reluctant to hire young women full-time. They view them as unreliable workers who would neglect their work responsibilities in favor of family interests or who may become pregnant and take maternity leave.

Job Segregation

Patterns of job segregation in Russia are similar to other societies: women-dominated areas have low pay, and women can earn more than their gender average in male-dominated industries, while men earn more in general (Nechemias 2016). Among the factors contributing to job segregation are the deeply ingrained beliefs about biological gender differences that are used to justify the division. For instance, the prevailing stereotypes view women as the “weaker” or “fair” sex and therefore naturally fit for working in such areas as social services and health care, the arts and culture, and education. Gender-segregated employment spheres include health care providers (doctors and nurses) and teachers; in Russia, both spheres are state funded and notorious for low salaries. OECD data shows that the share of female instructors across all levels of education is 85 percent, with the highest, more than 90 percent, being in primary education (OECD 2016).

Another factor is that, following the state’s transition to market economy, men left the public sector and gravitated toward private entrepreneurship; women continued working for the state, earning less but enjoying higher job security. Currently, many public-sector jobs are paid well below the national average, and sometimes even below basic subsistence levels. Teachers earn less than the average salary paid to all women and roughly half the average male salary. Doctors’ and nurses’ wages are comparable to those

of shop assistants and street cleaners, amounting on average to 19,000 rubles a month in 2010 (around USD\$650 before the 2014 crash of the ruble). At the same time, other traditionally female occupations, such as accounting and finance, turned out to be in high demand in the private sector, bringing high salaries and economic independence to women employed in these areas. Yet, the increase in demand and popularity of these professions has led to the influx of men, and now the percentage of women in finance has dropped from 89 percent to 67 percent from 1985 to 2013 (Nechemias 2016).

Russian working women continue to face a gender pay gap and poverty. In the Soviet period, the gender pay gap was 70 percent, sinking to 58 percent in the 1990s, and remaining around 65 percent in 2013. In the 2008 global financial crisis, female-headed families with minor children were at the greatest risk of falling below the poverty line. Official Russian statistics on poverty show a decline from 29 percent in 2000 to 11 percent in 2013 (FSSS 2014). Yet, the rates of poverty among children are increasing, and for those under age 16, they reached 28 percent in 2013. By 2010, an estimated 29 percent of Russian households with children were headed by women, increasing the risk of poverty in such families.

Family Life

As in other areas, Russia combines both modern and traditional values in family life. Russian women, like in many other societies, balance family, childbirth, and work. Despite high levels of education, employment, and reproductive freedom, they marry and become mothers early and nearly universally. A person can legally marry from age 18, and 16 in certain cases, while the age of consent for sexual relations is 16 for both women and men. Common-law marriages are also widespread, especially among younger generations residing in urban areas, and partners in many such unions only legally marry following a pregnancy (Demoscope Weekly 2016). Polygamy is illegal, but it is practiced in predominantly Muslim regions, especially in North Caucasus. Same-sex marriage is not legal, and LGBT people in Russia often face extreme prejudice and, since 2012, legal persecution.

Continuing the Soviet tradition of viewing motherhood as a civic duty of every woman, motherhood is considered an essential part of being a woman, and voluntary childlessness is very rare, if not stigmatized (Temkina 2010). The average age of first childbirth is 24 years, and most women

Women's Voices

Anastasia Danilova

Anastasia Danilova was born in April 1983, in Novocheboksarsk, Chuvashia Republic, Russian Federation. She was thrust into the women's rights movement in 2004 when she moved from Russia to Moldova to join her girlfriend. Facing threats by authorities when registering as a foreigner, Danilova and her partner sought help from GENDERDOC-M, an organization created to "create a legislative, legal and social framework for lesbians, gay, bisexual and transgender people in society, by developing LGBT community, by informing, promoting rights and providing services, and expanding organisational capacities" (GENDERDOC-M). After working as a volunteer for the organization, Danilova now serves as its executive director. In her work, she has been a victim of threats and violence from both government and religious factions, but she stated, "I am ready to stand up for anybody's rights, even of those who fight us, like religious minorities. I believe in justice, and equality is a prerequisite for justice" (Civil Rights Defender 2012). Danilova and GENDERDOC-M now conduct surveys of Moldova youth to track the impact of their work and the attitude shift of the people. Of the threat from those who oppose her work, she said, "Now, when I know about my rights, I am not afraid of them anymore. When someone sees that you are afraid, they will use your fear against you" (Civil Rights Defender 2012).

marry early and have at least one child between the ages 18 and 25, often postponing consequent childbirth, sometimes indefinitely. The official gender ideology expressed by the government and the church leaders emphasizes and naturalizes the importance of motherhood, which is seen as an essential part of being a woman. The common stereotype is that a woman is only "truly" or "fully" mature

when she gives birth. Such an attitude can explain the fact that single motherhood in Russia is not seen as deviant but is rather normalized. Increasing numbers of children are born out of marriage, and traditionally high divorce rates have led to as many as 29 percent of all Russian families with children being headed by women.

The divorce rate in Russia is one of the highest in the world: in 2014, it was 4.7 divorces per 1,000 people, versus 3.2 in the United States and 1.9 in Norway (Demoscope Weekly 2016). Also, in 2014, 22 percent of all children in Russia were born to unmarried mothers (CIA 2017). Both single mothers and two-parent families extensively rely on the support and help of their family members. It is common for grandmothers to live with their daughters' families, taking care of the household (especially if the grandmother is retired) while mothers make money outside the home.

Russian men are still not willing to take on the Western ideal of involved fatherhood. Many nonresident fathers (fathers who do not live with mother and child) are reluctant or refuse to pay child support or raise their children, likely due to the widespread belief that women have the sole responsibility for family planning and better child-rearing skills (Utrata 2015). The lack of change in fathers' attitudes is at least partly supported by the state pronatalist policies that primarily support motherhood and not parenthood, as seen from various maternity benefits offered by the state and the recent antiabortion legislation.

At the same time, Russia has one of the lowest birth rates per woman in the world. Since the 1960s, it fell under the approximate minimum needed for the population replacement and has remained low ever since. The two-child family is the general ideal, but many families can only afford one child (Borozdina et al. 2016). In recent years, the birth rate has recovered to a certain degree, and as of 2015, it was 1.61 for women of reproductive age (CIA 2017). Sociologists argue that a combination of economic anxieties and insufficient child care options often contribute to Russian women's decision to have only one child (Temkina 2010).

Because Russian women are expected to be solely responsible for reproductive decisions, they often have autonomy in reproductive decision making. Conveniently, most forms of contraceptives are available without a doctor's prescription as over-the-counter medications. Perhaps more consequentially, abortion is legal and included in free state health care and, despite negative social attitudes, is common. In the Soviet Union, only 8–10 percent

Polina Savchenko

Polina Savchenko, a Russian LGBT activist educated in the United States, represents two major LGBT organizations in her home country. The first is the Russian LGBT Network, an umbrella organization that operates on a federal and national level to support local LGBT networks across Russia, with a particular goal of empowering activists in faraway parts of Russia (such as Siberia) to fight for the rights of LGBT people. The second organization is the St. Petersburg LGBT organization Coming Out, a volunteer-based operation and the largest regional grassroots LGBT rights organization in Russia. Savchenko has cited Coming Out as her “baby,” as a founder and leader of the organization. Coming Out’s work focuses on raising awareness in Russian communities, mobilizing the LGBT community, and providing psychological and legal support for the LGBT community.

of women used hormonal and intrauterine (IUD) contraceptives; abortion was the main method of birth control. The situation began to change in the 1990s as a variety of birth control methods became available. As of 2014, 68 percent of women use birth control (OECD 2016), and the total number of abortions has been declining. Yet, the procedure remains very common: in 2014, there were 930,000 abortions in Russia—a decline from the 1.67 million abortions in 2005. Thus, there are 48.1 abortions per 100 births or 29.5 abortions per 1,000 women ages 15–49 (FSSS 2016). Russia consistently reports the highest numbers of abortions of any country in the world (United Nations World Abortion Policies 2013).

In 2011, the state attempted to restrict abortions for the first time since the collapse of the Soviet Union. Lawmakers used the demographic crisis (an older dying population) and concern for women’s health as the reasons to restrict the access to abortion. Despite a public campaign against new restrictions, the State Duma passed a law

banning abortions after the 12th week (excluding pregnancies from rape and medical necessity) and introduced a waiting period of two to seven days between a woman’s request for an abortion and the procedure itself. Supposedly, this time is given to women so they can reconsider the decision to terminate the pregnancy.

Between 2013 and 2015, several Russian members of parliament (MPs) attempted to pass legislation that would severely limit access to free abortion to only the termination of pregnancies that resulted from rape, that threatened the mother’s health, or that may result in birth defects. The proposal also included requirements for women to watch an ultrasound image of the fetus before the procedure—with the hope of changing their minds—and a consent form signed by at least two family members. Although never actualized into a law, such an initiative reflects the antiabortion politics pursued by the Russian state. Actively endorsed by the church leaders and authorities alike, pronatalist thinking considers Russia’s demographic problem a national priority, but the only solution favored by the state is the stimulation of birth rate attempted, among other ways, at the expense of women’s reproductive freedom.

Only heterosexual families are supported in Russia. Russia does not have any form of legal union for same-sex couples, nor does it offer any legal protection against discrimination based on sexuality or gender identity, making Russian LGBT people vulnerable to prejudice, persecution, and violence. In the Soviet period, male homosexuality was a crime punished by up to eight years in prison. Same-sex relationships between women were treated as a mental illness or excessive immorality. In 1993, Russia decriminalized male homosexuality and removed it from a list of mental disorders in 1999, but homophobia is rampant and widespread in every level of Russian society.

Beginning in 2006, bans against the “propaganda of homo- and bisexuality and transgenderism” were proposed and enacted, first on regional levels; in 2013, the ban on the propaganda of “non-traditional sexual relationships” to minors had been passed by the State Duma and signed by President Putin. This law made dissemination of any positive information about LGBT people an administrative offense, penalized by fines from 4,000 to 200,000 rubles (USD\$60–\$3,000 in 2016). The real consequences of the deliberately vaguely written ban are much graver. Russian officials now deny the very existence of LGBT-identified minors, making them especially vulnerable to various forms of violence, from bullying to conversion therapy. The ban and the state-sponsored homophobic campaign

that accompanied its adoption have de facto sanctioned violence against the LGBT Russians. Since LGBT people are not considered a social group, there is no legal protection from discrimination or violence based on sexuality or gender identity; thus, the state does not keep statistics on how much violence LGBT people face.

The Russian LGBT Network, one of the few organizations involved in LGBT rights activism and advocacy, reported 284 cases of violence and discrimination in 2015. Notably, murders and assault of the LGBT individuals are never persecuted as hate crime cases, and most such offenses go unreported. LGBT people are afraid of the police because of prejudice and transphobia; indeed, according to the Russian LGBT Network, there were 21 cases of abuse by the law enforcement officials in 2015 alone (lgbtnet.org 2016).

Another strong factor influencing the resurgence of anti-LGBT sentiment in Russia lies in its national ideology. Russian officials view LGBT rights as a part of Western values, antithetical to the so-called Russian national identity and “traditional family values.” Thus, popular attitudes are unlikely to change as long as the state pursues this form of Russian exceptionalism.

Politics

Following the Bolshevik Revolution, one goal was to ensure the emancipation of, and the equal rights for, women. Women received the right to vote in 1918. Women were widely represented at local and municipal levels of politics (in town councils, etc.), but not in the high echelons of the Soviet government. Only one woman, Ekaterina Furtseva, was ever a member of the Politburo, the USSR's highest political body, from 1957 to 1961. So, despite official claims that 30 percent of political positions were held by women, most held positions lower in status.

The legacy of these communist policies lingers in contemporary Russian society: women widely participate in local politics, but much less so on the federal level. In 2014, 14.5 percent of the MPs were women, lower than the world average of 22 percent but higher than ever before in Russia (UN Women 2015; UNDP 2016). Moreover, according to a 2014 study of Russian political elites, the more political power a position has, the more likely it is to be staffed by men (Johnson and Novitskaya 2016). For instance, in the Russian government, only 1 minister is a woman (out of 21); women hold 8 percent of the seats in the Federation Council, 14.5 percent in the Duma, and 21 percent seats in

Pussy Riot Challenges Russia's Antigay Law

The 2014 Winter Olympics in Sochi, Russia, took place amid significant controversy surrounding Article 6.21, Russia's antigay propaganda law. During the months between the article becoming law and the opening ceremonies, activists around the world debated the safety of lesbian, gay, bisexual, transgender, and queer (LGBTQ) athletes and allies at the games.

Pussy Riot—the provocative Russian feminist punk rock protest group that made headlines in 2012 for a subversive performance and subsequent prison time—made an appearance in Sochi. Known for LGBTQ activism, Nadezhda Tolokonnikova and Maria Alyokhina were detained for hours at a police station near Olympic Park and were beaten by Russian security officials. The pair had been filming a music video for their song “Putin Teaches Us to Love Our Motherland.” It includes lyrics that are highly critical of Russian President Vladimir Putin and his government's policies against LGBTQ rights.

Video footage of the beating was widely circulated. Despite being threatened with violence and imprisonment as punishment for their activism, Tolokonnikova and Alyokhina remained defiant: “We have no reasons to be afraid. We are free people, and free people feel no fear.”

—Whitney K. Archer

the Public Chamber—an organization that has little political power (Johnson and Novitskaya 2016). Consequently, there have been no female prime ministers or presidents.

When women do reach high political positions, such as ministers or vice presidents, they tend to be appointed in stereotypical portfolios. For example, Veronika Skvortsova, Russia's only female minister as of 2016, is the head of the Ministry of Health. Olga Golodets, the deputy prime minister since 2012, is in charge of social affairs. Yelena Mizulina, one of the most notorious members of parliament, had long been the head of the Duma Committee on Family, Women, and Children's Affairs before being moved to the Federation Council in 2015.

Notably, women in the high levels of Russian politics fall into three categories: “loyalists,” “workhorses,” and

“showgirls” (Johnson and Novitskaya 2016). “Loyalist” women are known for the unconventional support of the existing regime, often expressed in their proposing and sponsoring legislative initiatives for the political leaders, even if some of such initiatives are against the best interests of the society. Mizulina, for instance, sponsored the gay propaganda ban and is one of the strongest supporters of the antiabortion legislation. Yelena Yarovaya has authored some of the most controversial laws, including the “foreign agents” law in 2012–2014 and the 2016 legislation that sanctions nationwide surveillance practices.

“Workhorses” clean up the messes left by their predecessors. Prominent women politicians, such as Elvira Naibuillina, the head of the Russian Central Bank, and Valentina Matvienko, the former governor of Saint Petersburg, were appointed to their respective positions at a moment of crisis. These workhorse positions have huge responsibilities, usually complicated by multiple problems, and a potential to become targets of public criticism.

Finally, “showgirls,” who make a large number of female MPs and members of the Public Chamber, are usually celebrities—ballet dancers or Olympic athletes—invited into politics to appeal to the masses and increase the popularity of Putin’s regime. Sadly, women politicians from all three categories do not advocate for women’s issues, not only because women’s issues are not considered a top priority in Russia, but also because they are increasingly believed to be a part of an anti-Russian conspiracy orchestrated by the West.

Russia does not have a strong feminist movement. For the overwhelming majority of Russian citizens, *feminism* is a negative word. It is strongly associated with a Soviet approach to gender: when women were mobilized into the workforce and exploited under the pretense of equality. Furthermore, small pockets of feminist activism, such as socially oriented NGOs, grassroots movements, and online communities on social media, have lately become targets of the government’s attempts to limit civil freedoms and crack down on public dissent. For example, most NGOs with a feminist or LGBT rights agenda have been targeted under the foreign agent law; many were forced to shut down their operations. The gay propaganda ban makes the lives of non-heterosexual women especially precarious, as most same-sex families with children in Russia are formed by women. Their very existence can be interpreted as propaganda of nontraditional sexuality to minors, that is, to the children in such families, potentially leading to the loss of parental rights.

State policies affecting Russian women are pronatalist and aimed at the stimulation of birth rates through a

variety of measures, primarily the maternity capital program. Introduced in 2006, after President Putin’s statement about the government’s intent to solve Russia’s demographic crisis, the maternity capital is believed to be the most prominent measure of the country’s pronatalist policy (Borozdina et al. 2016). The capital is an “award” given to every woman once her second child turns 18 months. In 2006, it was 250,000 rubles (roughly USD\$12,000); indexed to inflation, in 2016, it was around 430,000 rubles (USD\$6,700). Beginning in 2008, families were allowed to withdraw 20,000 rubles (around USD\$310 in 2016) in cash from the capital immediately after childbirth. Notably, fathers can only be eligible for the benefit in case of the mother’s absence (i.e., if they adopt the child); death; or loss of custody. The capital can only be spent in three ways stipulated by the state: toward housing, the child’s education, or the mother’s retirement. Public surveys show that, of the three, investing the maternity capital in housing has been the most popular choice. However, as its amount is actually not enough on its own to even make a first mortgage payment, the maternity capital has mostly been useful to the middle-class families. Working-class mothers lack additional resources, such as relying on relatives’ money or bank savings, when purchasing a property or applying for a mortgage.

In the 10 years after the program was introduced, it generally failed to increase the number of births. Research suggests that the maternity capital may influence the timing of the second child, but not the overall decision about the intended number of children in a family (Borozdina et al. 2016). Besides, the widespread Russian citizens’ distrust in their state leads to many being skeptical and suspicious about the maternity capital: as of 2012, only 25 percent of recipients eligible for the benefit actually used it, while the rest complained about the program’s inaccessibility or uselessness. The maternity capital program has shown to be a controversial measure and an example of the state’s paternalist politics as well as its disregard of fathers’ involvement in, and responsibility for, reproduction and child-rearing. Combined with the growing number of attempts to restrict women’s access to abortion, the maternity capital program shows that Russian pronatalist ideology views women primarily as a reproductive resource, often with disregard for their autonomy.

Religious and Cultural Roles

Russia is a predominantly secular state that has one of the highest numbers of nonpracticing believers in the world.

While the Russian Orthodox Church would like to claim that more than 80 percent of the population identify as Orthodox Christian, only around 20 percent practice the religion regularly. The rate of practicing Muslims is about 10–15 percent as well (CIA 2017). Nevertheless, Orthodox Christmas (January 7) is a national holiday, and all children in middle grades are required to study basics of religion or secular ethics, depending on their parents' choice. In reality, most end up studying Orthodox Christianity or Islam, depending on the region.

All four official religions in Russia—Orthodox Christianity, Islam, Buddhism, and Judaism—hold very patriarchal perspectives on women. None of them allows for women ministers. The Russian Orthodox Church's (ROC) view is particularly conservative, as the church leaders rely on *Domostroi*—a 16th-century family conduct book that prescribes, among other things, wife beating and the full obedience of women to their fathers and husbands. In 2011, Vsevolod Chaplin, the head of the ROC public relations department, caused a controversy when he publicly blamed women who were the victims of sexual violence and proposed the “Orthodox dress code,” consisting of modest clothing, as a rape prevention measure.

Another example of the church's hostility toward women is the 2012 persecution of the feminist punk band Pussy Riot. While the band's famous “punk prayer” in the Moscow Cathedral of Christ the Saviour was clearly a political action against the strengthening union between the ROC and Putin's government, the church leaders and progovernment media chose to portray the band members as god-hating blasphemers who dared to step onto the altar—an area of the church prohibited to women—thus destroying things sacred to believers. As a result, the court found Pussy Riot guilty of religious hatred and violating the feelings of believers and sentenced two female band members to two years in labor camps (Gessen 2014). The Pussy Riot case illustrates the symbiosis between the state and the religious leaders who, seeking to increase the influence of religion and “traditional values” in Russia, are turning to the most conservative and patriarchal ideas as long as they are useful to Putin's regime and its ideology of Russia's exceptionalism.

Finally, while religious holidays such as Easter and Christmas are becoming more culturally significant, Russia has a number of widely celebrated secular state holidays, including the International Women's Day, celebrated on March 8. While in most countries, it is considered a feminist event, in Russia, Women's Day has been transformed

into a celebration of traditional femininity. On this day, women are praised for such qualities as beauty and kindness and are given gendered gifts, such as things for the house, flowers, and beauty products. It is only in the last five or so years that a few feminist activists have been able to partly reclaim the holiday, holding public events, rallies, and demonstrations to address women's issues. For most Russians, however, March 8 remains the day when men of the family ceremoniously take on the domestic chores while celebrating the feminine virtues of their mothers, wives, and daughters.

Issues

Absence of a Strong Feminist Movement

The majority of women's issues in Russia—such as domestic and intimate partner violence, sexual harassment, discrimination, attacks on reproductive freedoms, and specific problems experienced by the most vulnerable categories of women (nonheterosexual, transgender, migrant, and ethnic women)—stem from the absence of a visible and strong feminist or women's movement in combination with the neoconservative ideology of Russian exceptionalism pursued by the government and religious leaders. Most Russians, men and women alike, are deeply suspicious about feminism and women's rights, deeming them either redundant in the seemingly equal society or a low priority in comparison to general social problems, such as corruption or economic stagnation. Moreover, state-controlled media portray feminism and gender equality as forces of a Western conspiracy employed to destroy the traditional Russian family and, ultimately, the nation itself.

The head of the Russian Orthodox Church, Patriarch Kirill, asserts that feminism is dangerous because it gives women ideas about “pseudo-freedom” outside family and marriage. Some church leaders even question the necessity of women's vote in elections. The backlash against feminism is useful to Putin's regime, as it promotes the idea of Russian exceptionalism and how Russia is unique and different from the West. Not surprisingly, feminist and LGBT movements that advocate for same-sex marriage, gender equality, personal autonomy, and protection from domestic and intimate violence and gender-based discrimination are associated with Western values and, therefore, unacceptable for Russia. Evidently, this ideology allows the government to kill two birds with one stone: it can keep the population perpetually mobilized against the imaginary enemy in the form of anti-Russian conspiracy and

simultaneously relieve itself of the responsibilities to solve the above-mentioned issues.

Violence against Women

The Russian Ministry of the Interior does not recognize domestic and family violence, treating them as acts of everyday violence. Thus, many women do not trust the police or deem it effective to seek protection. Little credible data is available on the rates of domestic and intimate partner violence (Jäppinen and Johnson 2016). According to a 2003 survey, 80 percent of women experienced psychological violence from their partners, and every second woman had suffered from physical violence committed by her intimate partner at least once in her life, with one of every five women experiencing severe or regular violence (Jäppinen and Johnson 2016). In 2013, 36,000 Russian women experienced physical abuse from their intimate partners daily. Yet, only 30–40 percent seek help, and 97 percent of the cases of intimate partner and domestic violence never reach courts, mostly due to the common belief that domestic violence is a private matter between the victim and the perpetrator and reconciliation between the former and the latter, not prevention or punishment, is a desirable outcome (RIA Novosti 2013). Altogether, this limited data suggests that domestic violence is widespread in Russia and is higher than the world lifetime average of 35 percent (WHO 2013).

Yet, unlike most postcommunist states, Russia does not have legislation against domestic violence. Lawmakers have been working on the proposal for such legislation since 1995, and yet the project achieved little interest or support from the authorities. In 2013, the project was finally scheduled for the parliamentary hearings, but it was dropped because of the efforts of the Russian Orthodox Church and conservative activists, who saw in the proposal a threat to the traditional Russian family (Jäppinen and Johnson 2016). Also, within the last decade, the state has done little to support the victims of domestic violence. Most women's crisis centers and shelters are still run as volunteer organizations by churches or internationally sponsored NGOs. As of 2010, there were only 19 state crisis centers and 23 shelters for women. Altogether with the volunteer organizations, they were visited by approximately 80,000 women (Skripnik 2016). Recently, the "foreign agent" legislation seriously affected many of these organizations, leading some of them to halt operations. While most Russians acknowledge the existence of

domestic violence as a social problem and do not condone it, the state has largely failed to address the issue.

Vulnerable Categories of Women

The lack of a feminist voice combined with a neoconservative turn in Russian social politics have made certain categories of women particularly vulnerable to social injustice. For instance, in the atmosphere of rampant xenophobia, migrant women have been disproportionately exposed to crime and corruption. Often lacking residential rights and prone to social isolation, they remain invisible to most feminist and human rights organizations (Johnson and Novitskaya 2016). Another category is women of North Caucasus, especially residents of Chechnya, Dagestan, and Ingushetia—regions with a history of separatism and armed conflict, albeit mostly contained by Putin's government. Human rights activists argue that the welfare of women in these areas are the most precarious (Demoscope Weekly 2016). Women face heightened levels of discrimination, as their behavior, appearance, and morals are heavily controlled under the pretense of keeping with regional traditions.

Local authorities operate within a complex intersection of several legal systems, including sharia law and precolonial customs, quite often resulting in the despotism of regional leaders who interpret the laws as they please. For example, in divorce, mothers usually lose the custody over their children, and there is anecdotal evidence that the rates of domestic violence in North Caucasus are the highest in the nation (Jäppinen and Johnson 2016). Polygamy, arranged marriage, female circumcision, and honor killings—all illegal in Russia—are practiced in the region with the endorsement from local authorities and spiritual leaders. In an informal agreement between President Putin and regional authorities, the Russian government does not interfere with the area's interior politics and social issues, even though such negligence leads to mass violations of human rights.

Russia's turn toward neoconservative ideology with its emphasis on women's reproductive value has also affected the lives of transgender and nonheterosexual women. The state views them as both the embodiment of Western individualism and less valuable members of society. Transphobia and homophobia have always been virulent in Russian society, and yet, the 2013 gay propaganda ban has made it nearly impossible to be open about one's sexuality or gender nonconformism and avoid violence and discrimination. For nonheterosexual women, the legislation means

having to live in the constant fear of being exposed and losing their children, if they have any, to homophobic relatives or social services.

For transgender women, the sex-reassignment process has become increasingly more difficult. In Russia, most cases of gender variance are understood as transsexualism, which, once diagnosed by medical experts, is treated by sex-reassignment surgery and hormones. To have one's gender legally changed, a person has to be diagnosed by a special medical committee on sex reassignment. Most transgender people report challenges in accessing medical help and the consequent change of identification documents. According to the 2012 survey, 36 percent of transgender Russians cannot find the medical committee needed for the diagnosis at the place of their residence, 54 percent cannot find a skilled and unbiased medical provider, 40 percent have to work out the appropriate hormonal treatment by themselves, and 40 percent do not have access to hormones at all. Of those seeking surgical treatment, 31 percent cannot afford the surgery, and 60 percent reported experiencing financial difficulties in saving for the treatment, as these procedures are not included in the health care system (Vyhod 2013).

As in most other societies, Russian transgender women struggle with prejudice and discrimination. In 2011–2012, one out of every four transgender persons experienced physical violence, most likely from family and friends (Vyhod 2013). Following the transition, even if they manage to obtain proper documentation, many transgender women face extreme job discrimination and are often forced to turn to sex work. Since 2014, the Russian government has banned transsexual people from obtaining a driver's license, and in 2015, a proposal to prohibit marriage for transgender persons was introduced to the State Duma. Finally, in summer 2015, the efforts of conservative activists led to disbanding of the sex-reassignment committee in Saint Petersburg, thus leaving many transgender people without access to the initial step in transitioning.

In the 21st century, most of the issues faced by Russian women are not caused by the lack of resources or development, but by national and religious ideology. If the country's leaders continue their pursuit of narrowly defined paternalist and pronatalist politics, viewing and valuing women primarily as a reproductive resource, and simultaneously define civil liberties and individual rights as antithetical to Russian exceptionalism, most of the issues outlined in this entry are not likely to improve.

S

Serbia

Overview of Country

Serbia is a landlocked country in Southern Europe that is located on the Balkan Peninsula. It is bordered by Hungary, Romania, Bulgaria, Macedonia, Kosovo, Albania, Montenegro, Bosnia and Herzegovina, and Croatia. The capital of Serbia is Belgrade, which is located in north central Serbia. The country is slightly more than 77,000 square miles, and the terrain has a mix of mountains, basins, and plains. Serbia's population ranks 102nd in the world, with a population of more than 7 million people (CIA 2016). Serbian is the official language in the country, though Hungarian, Romany, Bosniak, and Albanian are spoken among ethnic groups.

Women represent 51.3 percent of the Serbian population (CIA 2016). Serbia is currently ranked at 40.6 percent on the Gender Equality Index (GII) in the Republic of Serbia, while the European Union (EU) member states are at 52.9 percent (Babović 2016). Babović states that gender equality in Serbia is similar to other countries in the region or other countries with socialist pasts (22).

Girls and Teens

Teen Pregnancy

According to the Statistical Office of the Republic of Serbia's report from 2011, teenage pregnancy for girls between

the ages of 15 and 19 has declined by more than 30 percent since 2000, but the pregnancy rate remains high, as 7,000 girls in this age group become pregnant each year (SORS 2011, 91).

Reproductive Health of Female Youth in Serbia

In Serbia, more than 60 percent of young and adolescent girls have had some sort of sexual experience. Due to a lack of sufficient, accurate, and adequate family planning—and sex education in Serbia—many young women (and men) engage in risky sexual behaviors that lead to pregnancy and sexually transmitted infections (STIs). According to a study in the *Scientific Journal of the Faculty of Medicine in Niš*, “Young people in Serbia are not informed about contraception from adequate sources” (Radulović et al. 2014, 221–222). In schools, there is a lack of adequate information, and youth are not likely to speak to their parents about reproductive health issues (221–222). Because of this, youth are most likely to turn to media for reproductive health information (221–222). According to Radulović et al., more than one-third of students have been educated about sex by physicians, while only about 25 percent have gone to their parents for advice or education about sex.

Regarding pregnancy and women under the age of 20, 7.3 percent of all deliveries in Serbia are for women younger than 20 (221). In addition, STIs (excluding HIV/AIDS) are high in Serbia. As cited in Radulović et al., the

Regulation of the National Program of Healthcare for Women, Children and Youth in 2009 claims there are large numbers of youth who contract STIs each year, with youth under the age of 15 making up 3.6 percent of the total infected. Those between ages 15 and 24 make up 13.2 percent of the total infected (221).

Gender Roles

According to the U.S. Department of State, traditional gender roles in Serbia have led to discrimination of women—in rural areas, in particular. In some rural areas, women are unable to exercise their right to control property (U.S. Department of State 2011b). These gender roles point toward traditional thinking that men are superior to women (Listhaug, Ramet, and Dulić 2011, 71).

Education

K–University Level

According to the U.S. Department of State, education in Serbia is free through high school. There is no data to support a difference in the treatment of girls and boys at the primary, secondary, and postsecondary levels (U.S. Department of State 2011b). The U.S. Department of State reported that Serbian students in primary and secondary schools are required to attend classes for one of the seven “traditional” religious communities or on civic education (U.S. Department of State 2011a, 3).

The number of women has increased in college education enrollment and is slightly larger than the number of men. According to the Statistical Office of the Republic of Serbia (SORS), women are more likely to be enrolled in colleges and universities, and more women graduate from colleges and universities than men (SORS 2011, 91). According to this study, 55 percent of women attend college, and 61 percent graduate (91).

According to SORS, in the same report released in 2011, men (61%) study mathematics, natural sciences, technical science, computer science, manufacturing, and construction. Women (91%) generally study education, social sciences, health and social care, the arts and humanities, and business and law. An equal number of women and men graduate in the fields of agriculture and veterinary medicine. In 2009, the number of women and men with doctoral degrees was equal, and women accounted for 44 percent of all doctoral and master's degrees and specialists among teaching personnel at universities and colleges (91).

Adult Education

In Serbia, a recent shift in thinking surrounding adult education occurred when, in 2011, the country implemented the Elementary Functional Education of Adults, a basic educational system for adults that includes vocational, general, and liberal courses (Popovik 2013).

Health

Reproductive Justice and Health

It is important to understand that *reproductive justice* is an all-encompassing term. Reproductive justice refers to safe, legal, and affordable access to abortion and reproductive rights that include safe and affordable maternal care, comprehensive sex education, and parental resources. Reproductive health and well-being is often informed by medical, cultural, social, political, and economic institutions.

Maternal Health

Serbia currently includes maternity care in its centralized health care system. According to Arsenijevic et al. (2014), maternity care in Serbia is undergoing constant changes. In a qualitative study with women who had given birth in maternity wards in Serbia, the authors concluded that there had been issues with payments as well as information and care given to the mothers-to-be from the medical staff. One thing women were concerned about was having outdated referrals from primary care physicians. To be admitted into a maternity ward, women were required to have a referral that was not more than three weeks old. As birthing happens on its own clock, many women (12.6%) said their referral had expired, and they had to wait in the lobby while their physician wrote a new referral (16).

In addition, hospital staff was criticized for having terrible bedside manners and for not assisting postbirth with things such as breastfeeding (18). Also, women said equipment did not work, and they were often forced to pay for services before the birth and were not given a refund if those services were not utilized during the birthing process (20). There were also reports of insects in rooms, lack of hot water, dirty linen in rooms, and so on. In some cases, women were allowed only short visitations from family members. The new mothers expressed this made them feel lonely and isolated (19).

Maternity Leave

According to the Bureau of Statistics, as reported by the U.S. Department of State, maternity leave is provided by law. However, not all private companies meet these legal obligations. Nongovernment organizations (NGOs) reported that some childless women felt discriminated against during the hiring process at private companies because employers feared they would take maternity leave in the future (U.S. Department of State 2011b).

Diseases and Disorders

Fifty percent more Serbian men than women aged 30–59 die from cancer and circulatory diseases (SORS 2011, 91). In addition, men are more likely to die in transport accidents and because of suicide (91).

Employment

SORS (2011) reported on differences in employment based on gender, including factors such as children. According to the report, employment rates are different between men and women who live with children under the age of 16. Men are more likely to be employed, even if a married couple has no children. For a married couple that has children, female parents aged 25–49 are 25 percent less likely to be employed than their husbands (92).

Concerning self-employment (including on farms and unpaid labor), there are two times as many self-employed men (28%) between the ages of 15 and 64 than women (14%) (92). However, women are more likely to contribute to unpaid household and family farm or shop work than men. Thirteen percent of all women and 24 percent of women aged 55–64 (compared with 4% and 2% of men, respectively) contribute to unpaid labor, and “28 percent of all farms are registered as women-owned; women, however, make up only 23 percent of all independent farmers and 71 percent of unpaid contributing family workers in agriculture” (92). In addition, according to the first Time Use Survey carried out in Serbia as reported on by SORS, women have on average about one hour of free time each day, compared with men who have several hours of free time. Men spend more time doing paid work, and women spend, on average, two hours or more per day doing unpaid work (92).

There are somewhat more women in each age category of the unemployed, long-term unemployed persons

of working age, and among the registered unemployed. Among unemployed women, the majority has a secondary education (92). According to a survey by the Bureau of Statistics, the unemployment rate for women in Serbia was 20.4 percent, as compared to 18.3 percent for men (U.S. Department of State 2011b). Thirty percent of managers and 20 percent of chief executive officers were women. Only 12 women sat on the administrative boards of companies (U.S. Department of State 2011b).

Among old-age pension beneficiaries, women account for just over a half, while men make up almost two-thirds of all disability pension beneficiaries. In both categories, women on average receive lower pensions than men; women on average have 18 percent lower old-age pensions and 14 percent lower disability pensions than their male counterparts (SORS 2011, 92).

Family Life

Marriage

SORS reports that, on average, women enter their first marriage at the age of 27, and men enter marriage at 30 (91). However, 3 percent of girls are married before they turn 18. Most of these marriages occur among the Roma population.

Child Care

To successfully implement women in to the workforce in Serbia, it is important to recognize that family life and work life need to work in harmony. According to a report done in collaboration with the European Commission (2012), only 32 percent of children in Serbia between ages 3 and 5 are covered by formal child care (6). Child care is primarily the responsibility of the mother or, if available, the extended family, which is in part due to a limited number of child care facilities (6). This leads to women being unable to enter the labor force because of these additional responsibilities (6).

The European Commission also reported that, even though child care facilities are limited in Serbia, legislation for maternity leaves are quite generous. The minimum length of maternity leave in Serbia is four and a half months, and most women are granted one year for maternity leave. During maternity leave, mothers in Serbia are equally compensated, and the job will be guaranteed for

their return. When a third child is born, maternity leave could last up to two years (7).

Children

The U.S. Department of State's (2011b) summary of children in Serbia states,

Citizenship is derived from one's parents. The law on birth records regulates universal birth registration, but according to the UN Children's Fund (UNICEF), 5 percent of Romani children were not registered at birth. . . . Children who are not registered do not have access to public services such as health care. While the law provides that government clinics offer free medical care, including free medicines from a limited list of covered drugs, there were reports that corruption resulted in restricted access to medication for some. Romani children often faced difficulties in accessing health care. (U.S. Department of State 2011b)

Child Abuse

The U.S. Department of State on Serbia (2011b) also reported that child abuse was a problem. Children are often exposed to physical or verbal abuse as well as being exposed to drugs, alcohol, and violence. Children are often victims of family violence, and girls are often victims of sexual violence (U.S. Department of State 2011b).

In addition, the U.S. Department of State reports,

While teachers were instructed to report suspected child abuse cases, they often did not do so. Police usually responded to complaints, and authorities prosecuted child abuse cases during the year. In several court cases, defendants were found guilty of child abuse and sentenced to imprisonment. Psychological and legal assistance was available for victims. Children also were accommodated in safehouses for victims of family violence. . . . Children in orphanages and institutions were sometimes victims of physical and emotional abuse by caretakers and guardians and suffered sexual abuse by peers. (U.S. Department of State 2011b)

Child Marriage

In Roma and rural communities across Serbia, child marriage has been deemed a problem by the U.S. Department of State (2011b). In the Roma community, both boys and

girls usually married between the ages of 14 and 18, with 16 as the average age. Boys generally married a few years later than girls, and some girls married as early as 12 (U.S. Department of State 2011b).

Statutory Rape

According to the U.S. Department of State, in Serbia, the minimum age for consensual sex is 14 years old. Sentences for statutory rape range from 3 to 12 years in prison, and severe punishment can range from 5 to 15 years in prison. If the rape results in the death of the victim, the minimum sentence is 10 years (USDS 2011b).

Politics

Gender Equality

Several laws have been adopted since 2000 that help women gain equality. For example, the Gender Equality Law binds all public authorities to pursue equal opportunity and to monitor gender equality (SORS 2011, 89). This law addresses gender equality in family relations, employment, education, health care, sports, culture, and political and public life as well as with judicial protection (89).

In addition to the Gender Equality Law, the National Strategy for Improving the Position of Women and Promoting Gender Equality was passed in 2009. This law outlines state policies that are aimed at eliminating discrimination against women. The goal is to improve women's status and integrate gender equality in all spheres (89). Not only does this law attempt to enact change to improve the lives of women, but it requires that women be included concerning policy and decision making.

On February 14, 2014, the Women's Parliamentary Network was formed by a unanimous vote of all the women of Parliament. The main goals of the network, as stated by a presentation given in October of 2014, include the following:

- Adopting new laws and politics as well as supervision of implementation of existing laws, especially in following areas:
 - Women's and family health
 - Suppression of violence against women and children as well as of domestic violence
 - Economic empowerment of women
 - Education of women and promotion of women's knowledge

- Other priorities are the following:
 - Encouraging women in Serbia to take a more active part in the country's political and public life to raise awareness of women's solidarity
 - Promoting gender equality at all levels (National Assembly of the Republic of Serbia 2014)

According to SORS, there are 137 male mayors and only 10 female mayors within the 150 municipalities in Serbia. Within the 23 cities, 22 mayors are male, and only 1 is female (SORS 2011, 92).

LGBT

The Women's Parliament met in 2013 to discuss how to better the lives of transgender people who have sex-reassignment surgery. The Parliament conversed with members of the LGBT community, who urged them to adopt a law where individuals who have sex-reassignment surgery can change unique identifying information (National Assembly of the Republic of Serbia 2014).

In Serbia, as in many other places in the world, LGBT people still face issues with discrimination and safety. A first Belgrade pride parade was held in September 2014, but hostility toward members of the lesbian, gay, bisexual, and transgender (LGBT) community continues (HRW 2016).

Issues

Violence

Men are more likely to commit acts of violence than women in Serbia. Ninety-five percent of perpetrators are men, and 5 percent are women (SORS 2011, 91). In addition, crimes committed by youth in Serbia is gendered, with as many as 95 percent of all convicted minors being boys (91).

In addition to crimes committed by boys and men, violence against women rose by 15 percent between 2007 and 2010. The number of women killed by their husbands has also increased, and there are not enough shelters to provide safe temporary refuge to women escaping violence. Also, when a woman does call authorities for help,

Women's Voices

Vanja Calovic

Montenegrin activist Vanja Calovic dedicated her work to fighting corruption and organized crime in her home country of Montenegro through the Network for Affirmation of the NGO Sector (MANS). As the executive director of MANS, Calovic has exposed electoral fraud, governmental corruption, and human rights violations. This has led to a smear campaign by the government-influenced newspaper, which shared images of bestiality, insinuating they were Calovic. Calovic was tried for and found guilty of slander when she accused Vladimir Beba Popovic, director of the Public Policy Institute, of providing these false images. In response to the threat of jail time, Calovic said, "MANS will continue to fight for the creation of democracy in Montenegro and the rule of law, and that aim is worth every sacrifice, even life" (Robinson 2014). Calovic is one of more than 50 human rights activists who are being protected through the Natalia Project, a security program developed through the Civil Rights Defenders in which a warning bracelet is worn by activists and can be activated when they are in danger or have been harmed (Civil Rights Defenders 2013).

the emergency orders are not issued promptly (Babović 2016, 15).

Trafficking

Serbia is a source, transit, and destination country for men, women, and children subjected to sex trafficking and forced labor. This includes forced begging and domestic servitude. Serbian criminal groups in neighboring countries, Russia, and Europe (especially in Germany, Italy, and Switzerland) subject women to sex trafficking. Serbian men, especially, are subjected to labor trafficking for the construction industry in European countries (Azerbaijan, Slovenia, and Russia) and the United Arab Emirates (UAE). Serbian children, particularly ethnic Roma, are subjected within the country, often by family members, to sex trafficking, forced begging, forced labor, and petty crime (U.S. Department of State 2011a).

Concerning punishment and the judicial process in Serbia regarding trafficking, “Fewer traffickers were convicted, and those that were received weak sentences. The government did not afford victims sufficient protection in criminal proceedings, which exposed them to intimidation and secondary traumatization” (U.S. Department of State 2011a).

Specifically, during the judicial process, it was reported that victims’ rights were not adequately protected during court proceedings, and victims frequently had to appear in front of their traffickers. In court, traffickers often intimidated or threatened the victims. Judges seemed to have limited understanding of the complexities of human trafficking cases. Serbian law entitles victims to file civil or criminal suits against their traffickers; however, judges often encouraged victims to seek compensation by filing civil suits. These are expensive and lengthy, and they often require the victims to face their abusers multiple times (U.S. Department of State 2011a).

Domestic Violence

In a country report by the organization Women against Violence in Europe (WAVE) in 2012 on Serbia, based on a survey of 2,500 Serbian women, 54.2 percent of the women in Serbia have experienced family violence at some point in their lives, while 37.5 percent reported experiencing family violence in the past year (WAVE 2012). In addition, 21.6 percent of women have experienced physical violence, 3.8 percent have experienced sexual violence, and

48.7 percent have experienced psychological violence in their lifetime (WAVE 2012).

Rarely in Serbia is data collected at the national level. Instead, it is collected at the local level. There is no data collected on the national level on medical interventions related to domestic violence or intimate partner violence. There is only one national women’s helpline, 13 women’s shelters, and 23 women’s centers in Serbia. There is no information available on the existence of centers for female survivors of sexual violence (WAVE 2012, 227).

According to the findings, 15.8 percent of women have experienced economic violence in their lifetime, and 11.4 percent of women have experienced it in the last twelve months. The majority of this violence is committed by men (physical 89.9%, psychological 79%, and economic 85.3%). A majority of the perpetrators are partners or husbands (physical 71.7%, psychological 58%, and economic 50.6%). Ninety-six percent of the perpetrators are men in the cases of the most severe violence (WAVE 2012, 225).

Sexual Assault and Rape

According to a 2011 report by the U.S. Department of State, rape is punishable by up to 40 years in prison. This also includes spousal rape. Rape victims, however, hardly ever report their attacks due to fear of reprisals from their attackers or humiliation in court. Few spousal rape victims filed complaints with authorities. Women’s groups believed that sentences for the offenders were often too lenient. Out of 78 cases of rape tried during 2011, 63 resulted in convictions (U.S. Department of State 2011b).

Human Rights

The Bureau of Statistics claimed that in 2005, the year following President Boris Tadić’s election, human rights problems increased. These included the following: harassment of journalists, human rights advocates, and others critical of the government; physical mistreatment of detainees by police; limitations on freedom of speech and religion; inefficient and lengthy trials; government failure to apprehend the two remaining fugitive war crimes suspects under indictment of the International Criminal Tribunal for the former Yugoslavia (ICTY); a lack of durable solutions for large numbers of internally displaced persons (IDPs); corruption in legislative, executive, and judicial branches of government, including police; societal violence against women and children; societal violence and discrimination

against minorities, particularly Roma and the lesbian, gay, bisexual, transgender (LGBT) population; and trafficking in persons (U.S. Department of State 2011b).

Slovakia

Overview of Country

The Slovak Republic, or Slovakia, is a landlocked country in Eastern Europe bordered by Austria, the Czech Republic, Poland, Ukraine, and Hungary and has a total landmass of 18,800 square miles. Slovakia was not considered an independent country for most of European history and was instead seen as a territory. It was first settled by Slavs migrating from the region between the Danube River and the Tatra Mountains around 3,000 BCE. In the 9th century, the Slavs founded the Great Moravian Empire—the first common state composed of both Czechs and Slavs. During the reign of Svatopluk, from 871 to 894 CE, the Great Moravian Empire became a thriving and important European power. Hungarian tribes conquered the territory of Slovakia in the beginning of the 10th century, and the area became part of the Kingdom of Hungary for about 1,000 years and was incorporated into the Austro-Hungarian Empire (Kollar 2006, 6–7).

Slovakia, unlike the other "nations" in the Austro-Hungarian Empire, was not considered a nation in its own right, even after establishing a literary language and a political program. After the dissolution of the empire in 1918, following World War I, Slovakia joined with the Czech nation and formed Czechoslovakia as a common state. In 1939, Adolph Hitler ordered the country to be split

up and placed under the control of President Joseph Tiso. Although the people protested, Tiso led part of the German army into Slovakia and occupied it until the end of the war (9).

After World War II, the nation of Czechoslovakia was reformed, but it then fell under the rule of the Soviet Union from 1948 until the collapse of the Soviet Union in November of 1989. This change was called the Velvet Revolution, or the Gentle Revolution, due to its nonviolent transition of power. This led to the creation of Czechoslovakia as a parliamentary republic. The joint state was dissolved on January 1, 1993, in an event known as the Velvet Divorce, and an independent Slovak Republic was declared. Slovakia is now a parliamentary democratic republic with a multiparty system headed by a president (9).

As of 2012, the population of Slovakia was 5,445,800 and had 58,200 births per year (UNICEF 2016). The country's ranking based on its gross domestic product (GDP) is 72nd out of 188 nations and territories (CIA 2016). The Human Development Program ranks Slovakia's Gender Inequality Index (GII) as 35th out of 188 as of 2015 (UNDP 2014). However, the Slovak Family Planning Association and European Social Fund note that while Slovakia joined the UN Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) in 1993, there has been no effort made to implement the CEDAW into practice. The problems, which remain, are the participation of women in politics, remaining gender stereotypes in education and the larger society, violence against women, and access to reproductive health services (SFPA 2016).

Girls and Teens

Girls in Slovakia possess parity with the boys, at least in terms of primary and secondary education. The right to education is part of the Constitution of the Slovak Republic, and schools are open to all citizens. Basic education is offered for student ages 6–16, and this includes all primary education and one year of secondary education. Secondary education consists of general education classes as well as vocational and secondary vocational classes or apprenticeships offered to students so that they may enter a professional field when they leave secondary school. However, there is disparity between these expectations and the experiences of Roma in Slovakia. A majority of Roma adults have only received basic education, and some may not have received any. Roma children have a high dropout rate and are overrepresented in schools

for physically or mentally disabled children, a result that seems to originate from an insufficient command of the Slovak language rather than inherent limitations (Friedman et al. 2009).

Literacy and Education

Apart from this ethnic disparity, most young women in Slovakia enjoy the same educational opportunities as their male peers. On average, girls will have one additional year of schooling, 15.7 years compared to 14.5 years for males, with 99.1 percent of girls receiving at least some secondary education. The breakdown of education by level and gender shows some differentiation between males and females. For preprimary schooling, the gross participation rate for males from 2008 to 2012 was 91.7 percent, while during the same period it was 89.4 percent for females. For primary schooling during the same time, the gross participation ratio for boys was 100.6 percent, while for girls the ratio was 99.7 percent (UNICEF 2016).

As of 2015, the girls' literacy rate was 99.6 percent, which was the national average and only 0.1 percent off from boys (CIA 2016). This high rate of secondary education continues, though very abated, into postsecondary or university education. Slovakia's school system includes primary schools with kindergarten, apprenticeship training institutes, secondary vocational institutes, secondary high schools, secondary vocational schools, and special schools. These schools may be public schools run by the state, private schools, or schools run by a church, but each is held to the same educational standard (Slovak-Republic 2016a).

Sex Education

Sexual education in Slovakia is different than sexual education in most countries. Sexual education is supposed to be included in state-mandated education, as it is viewed as part of getting young people ready for marriage and eventual parenthood. However, unlike in other countries, sexual education is not taught as a separate subject in Slovakia. Instead, it is taught in conjunction with other subjects, particularly ethics, religious education, and biology. Even 10 years after the Ministry of Education approved a new sexual education curriculum in primary and secondary schools, the quality of sexual education in Slovakia is low. Young people commonly do not receive appropriate information on preventing the spread of sexually transmitted infections (STIs), including HIV/AIDS, or preventing

unwanted pregnancy. They also do not receive information on issues of sexual orientation or sexual and reproductive health rights (SFPA 2016). In 2008, the Committee on the Elimination of Discrimination against Women (CEDAW) made a recommendation to the government to promote sexual education more widely in schools and to target both girls and boys. This has not been followed. Currently, sexual education is no longer mandatory in schools, and there appears to be no move to change this.

Primary Education

In Slovakia, kindergarten is offered for children 3–6 years old to teach basic knowledge and skills, to develop communication skills, and to prepare children for primary school. Compulsory schooling commences in the beginning of the school year in which a child turns 6 and lasts until the child is 15 or 16. These primary schools are designed to prepare children to either enter the workforce or to go on to further education. The schools have 9 grades that are divided into Level 1 schools, called junior, which consists of the 1st through the 4th grades, and Level 2 schools, called middle, which are the 5th through 9th grades (Slovak-Republic 2016a).

Secondary Education and Job Training

Slovakia's secondary schools provide a full secondary education and secondary vocational training. With this system, they prepare their students to either enter a professional occupation or continue their education at a university. The secondary vocational training is a continuation of the students' general education combined with vocational training. This secondary vocational training ends after the student completes a final exam called the Leaving Certificate examination. This Leaving Certificate examination is also taken by students who receive the secondary education without vocational training. Secondary schools may also offer postsecondary and post-Leaving Certificate courses, which allow students the chance for supplementary general education or occupational and vocational training to acquire higher professional qualifications (Slovak-Republic 2016a).

University Education

The university system in Slovakia aims to prepare its students with a tertiary education in the technical and scientific disciplines, economics, social sciences, and the arts.

Currently in Slovakia, there are 20 public, 10 private, and 3 state universities and colleges. Programs of study are organized into three levels, and students advance each level after presenting and defending a thesis or dissertation and taking the State Examination. The first level, a bachelor's degree, takes the student three or four years to complete. A master's of arts, science, or engineering or a medical degree takes four to six years, but this includes the time for the bachelor's degree. The third level is the doctoral degree, which takes an additional three to four years (Slovak-Republic 2016a). The 2011 "Education at a Glance" shows that, of those who enroll, about 80 percent of women graduate from a university, while a little more than 40 percent of men graduate during the same period (Lalancette and Marin 2013). In fact, women received 71,100 bachelor's or equivalent degrees and 4,670 master's or equivalent degrees to men's 4,970 bachelor's or equivalent degrees and 2,820 master's or equivalent degrees. The numbers are closer in the awarding of doctoral or equivalent degrees, with women earning 5,200 degrees and men earning 5,700 degrees (Eurostat Statistics Explained 2015).

Health

Slovakia has state-mandated health care that all employed citizens must pay a percentage of their income into. The health care system in Slovakia is not to the same level as in other EU countries, but it does provide many benefits to women. On average, women in Slovakia live longer than men and have a slightly higher rate of surviving childhood diseases and illnesses. Since 1990, there has been a 58 percent reduction in the mortality rate of children under five years old and a 36 percent reduction since 2000. As of 2012, the infant mortality rate for children under one year old is 6 deaths per 1,000 live births, and the neonatal mortality rate is 4 deaths per 1,000 live births. The immunization percentages are the following: BCG 90 percent, DPT1 99 percent, DPT3 99 percent, polio3 99 percent, MCV 99 percent, HepB3 99 percent, and Hib3 99 percent (UNICEF 2016). The high rate of immunization is most likely due to all immunizations being covered under the health care system.

The birth rate among teenagers aged 15–19 is also low at 21.1 teenage pregnancies per 1,000 young women. In fact, the mean age that a woman has her first child is 27.8 years old (CIA 2016). Looking at these numbers, one might believe that the teenage birth rate and mortality rate is low because of free or easy access to birth control

or other reproductive health services; however, this is not the case. Slovakia has highly restrictive abortion laws, but the law includes a mandate that birth control be provided free of charge to prevent unintended pregnancies. Emergency contraception is available over the counter, but hormonal birth control, such as pills, patches, vaginal rings, injectables, and implants, must be prescribed by a gynecologist, though women may visit such a specialist without first needing a referral from their primary care physician (Center for Reproductive Rights 2015).

Despite the mandate for free access to birth control, Slovakia's national insurance program, which is mandatory for all citizens, does not cover the cost of these contraceptives, so women must pay for them out of pocket. Not even emergency birth control is covered, even though it is also supposed to be provided for in the law. Only 22.3 percent of women in Slovakia were using hormonal birth control by 2008. This number does not reflect how many women were seeking birth control, but it may be a close reflection of how many women had access to birth control. In fact, the only birth control method insurance does cover is sterilization, which is permanent and irreversible, making it an undesirable choice for young women who may want children when they are older. Slovakia also does not collect comprehensive data on reproductive health indicators, including the unmet need for contraception use. Because the data is not collected or available, it is impossible to hold public officials accountable for their failure to effectively address the health needs of women (Center for Reproductive Rights 2015).

Access to Health Care

Slovakia's health care services are rated average to poor when compared to the rest of the European Union. There is a system of compulsory, state-funded health care available to all citizens and long-term residents regardless of financial status. This system does not receive enough financial support from the government, and as a result, many hospitals are in debt. Private health care is available to those who wish to pay for it, but is it not often used. The Ministry of Health is responsible for overseeing health services in the country, and the Office for the Supervision of Healthcare supervises the hospitals and clinics. The office also oversees the five health insurance companies and regulates what services are offered as part of what is called the "solidarity package," the basic health care package (Europe-Cities 2016).

The five health insurance companies in Slovakia are responsible for collecting the health insurance contributions from the people and making reimbursements to hospitals, doctors, and clinics. Most the people receive insurance from the General Health Insurance Company, while the second-largest is the Common Health Insurance Company. Either company is guaranteed by the state, and Slovaks may change their insurance company at any time. There is little competition between the companies because each company offers basically the same levels of care and services; however, the companies have been making more attempts to attract new clients and keep their existing ones (Europe-Cities 2016). The funds from all who pay into the health care system are collected and then used to pay expenses in a fund, but the money gathered has been less than the money needed (Lalancette and Marin 2016).

Paying into the health insurance system is mandatory for anyone earning an income, while the government pays the cost for those who are exempt from paying, such as those who are unemployed, those who are retired, people on long-term sickness benefit, mothers on maternity leave, those looking for jobs, those on disability benefits, and reservists in the armed forces. State health insurance covers most medical services, including appointments with doctors, hospitalizations, prescriptions, treatment by specialists, pregnancy, childbirth, and rehabilitation (Europe-Cities 2016).

Maternal Health

Despite restrictions and difficulties in accessing birth control and limited access to abortion, Slovakia has what appears to be a strong system to promote maternal health. In fact, the maternal mortality rate is 6 maternal deaths per 100,000 live births. As the infant mortality rate is also 6 deaths per 1,000 live births, it is likely that these cases have more to do with injury or accidents than preventable deaths due to complications (UNICEF 2016). About 99.2 percent of births included a skilled attendant, and 23.5 percent of women delivered via cesarean section. With a movement to change birth practices and involve more midwives, it is probable that these births took place in a hospital, birthing center, or with the assistance of a skilled midwife. Additionally, 96.9 percent of women had a least one visit to a doctor after birth (UNICEF 2016).

Slovakia also has mandated paid maternity leave, though the pay is only 65 percent of what the women were

making before the leave. A woman is entitled to maternity leave that cannot be less than 16 weeks from the time of birth. Married women are entitled to 34 weeks of maternity leave, and single mothers may receive 37 weeks. If a woman has a multiple birth, she is entitled to 43 weeks of maternity leave. Men are entitled to the same length of paternity leave. Parental leave can be granted to women and men if the child requires extended care, up to the age of 3, regardless of whether they returned to work after the birth. If the child has long-term health issues requiring specialized medical care, parental leave can be extended until the child is 6 years old (Euraxess 2016).

Diseases and Disorders

In Slovakia, the incidence of HIV/AIDs is substantially lower than in the rest of the European Union. The National Reference Centre for HIV/AIDs reports that, since 1982, 222 people in Slovakia have been diagnosed with HIV and 23 have died from AIDs; although experts believe that the true figures could be 5–10 times higher than reported. Still, the numbers from Slovakia are low when compared to other countries. It is believed that the low prevalence of HIV/AIDs in Slovakia is more attributable to the country's isolation and location as a Baltic state than any public awareness campaign or sexual education in the schools. While the incidence of HIV/AIDs in Slovakia is low, the reported cases of syphilis have steadily increased over the years. In 1990, the incidence of syphilis in Slovakia was lower than the average of the European Union. Currently, the figures are around 4 times higher than the European Union (SFPA 2016).

Employment

While Slovakia was under Soviet control, women were “guaranteed” the same rights as men, but this “guarantee” did not extend past the writing. Women were seen as a source of cheap labor in a gender-segregated job market. This segregation was enforced by discrimination in the workplace and the glass ceiling. When the country became independent, women, who had been an underpaid part of the industrial workforce, were faced with a dilemma. They could stay at work and be economically independent, or supportive if they were married, and have active professional lives. But the conservative political parties, including the wives of political leaders, and the church pushed for women to return to their “traditional roles” as wives and mothers (Bitusikova 2005, 1006).

The push to put women back in the home did not receive much public support for several reasons. First, most families could not be supported by a single income. Second, women had known job equality on some level for almost 70 years, and so the idea that they suddenly had no place outside the home was rejected. Finally, with most women having achieved an equal or higher level of education than men during the period of socialism, they wanted to continue and build up professional careers (1007). The employment rate of women is 52.7 percent, and the rate for men is 66.7 percent (EU Initiative 2013). However, the system of “guaranteed” equal rights for women continued after the Soviet era into the modern independent Slovak Republic.

The Slovakian Constitution and succeeding acts have numerous protections for women regarding employment and equality; however, these protections do not extend beyond writing them down. Article 12, Section 2, of the Constitution states, “Fundamental laws and freedoms are guaranteed to all persons without regard to, *inter alia*, sex, gender, social origin, property or any other status. No one can suffer damage or disadvantage, or be given on the basis of these reasons, no one can be damaged, advantaged or disadvantaged.” The principle of gender equality is further expounded by the Act on Anti-Discrimination adopted in May 2004. This act sets a legal basis for equal treatment in that it states that equal treatment can only be secured when discrimination is prohibited. There are also several other laws that deal with promoting equal opportunity in specific areas of life, including access to employment, access to vocational training, equal access to schooling, social legislation, self-employment, and equal pay for equal work and work of equal value.

The primary issue is that there is no comprehensive strategy for gender equality in Slovakia. What policies do exist are contained in three separate documents: the National Action Plan for Women, the Concept of Equal Opportunities for Men and Women, and the National Action Plan for Employment. There is some overlap among the three plans, but they also deal with issues in different ways. The National Action Plan for Women utilizes a family-oriented and reactive approach, while the Concept of Equal Opportunities for Men and Women focuses on gender equality and how to bring equality into the mainstream. The National Action Plan for Employment was created by the special requirements of the European Employment Strategy. Slovakia was required to adopt it because of its membership in the European Union. However, none of these

policies have budgetary support nor trained experts in the field to implement their objectives.

The National Action Plan for Women is a five-page document adopted in 1997 as a response to the Beijing Declaration put forward at the Fourth World Conference on Women. It was more of a declaration by the government about placing a priority on equality between women and men. It was not a policy document with clearly outlined methods on achieving equality. In fact, much of the document was a reiteration of commonly known or understood facts, including that violence against women is real and that there is in fact a pay gap determined by gender. The Action Plan did not express a clear understanding of these issues, nor did it offer any solutions. It lists the eight priorities of the government as pushing for equality of men and women in the fields of employment and economic policies, family and social policies, and education legislation.

The Concept of Equal Opportunities for Men and Women was implemented by the Slovakian government in 2001. It sought to address the weaknesses of the National Action Plan, which beyond any sort of proposed policy included a lack of public discussion on the importance of equality and understanding the complexity of addressing equality in multiple fields. The concept identified the foremost areas where gender equality was a problem and attempted to propose solutions for some of the problems that could be implemented. Although the concept did not address all the policy areas listed in the National Action Plan, and in some instances lacked a systematic approach to implementation and focused entirely on legislative and normative methods of change, it was a more gender-oriented and professional approach to improving the status of women.

Drafted and submitted by the Ministry of Labor, Social Affairs, and Family, the National Action Plan for Employment (NAP) was adopted on May 21, 2003, by the Slovak government. With this document, Slovakia incorporated the European Employment Guidelines. The NAP uses the four-pillar structure of employability, entrepreneurship, adaptability, and equal opportunities that was put forward in the European Union Employment Guidelines. This document was the last passed and was supposed to bring the women of Slovakia equal status to their sisters in the rest of the European Union.

Family Life

Marriage and family are highly valued in Slovakian society. Family is very important to the people, with nearly 90

percent of Slovaks seeing family as the most important part of their lives and the same number marrying at least once (Marriage and Family Encyclopedia 2016). In another poll, 93 percent of Slovaks believed that children did better and were happier in homes with both parents living together (Kanderova 2007). Family is such an important part of life that a current opinion polls show that 70.1 percent of men and 78.7 percent of women see family and children to be the main barrier to entering into politics (Bitusikova 2005, 1013).

This focus on family is believed to be an influence of Christianity, but in recent years, the focus on family is moving away from close-knit units to independent nuclear families. While rural families may maintain multigenerational ties, increasing migration to urban centers and migration to Western countries have made the nuclear family the more common structure in Slovakia. People enjoy the economic benefits of marriage, and in many cases, parents receive a cash bonus when a child is born (Kanderova 2007).

Marriage and LGBT Rights

The people of Slovakia are noted in a report written by the Council of Europe to be very tolerant of LGBT individuals, with 80 percent of the population believing that society should accept homosexuality and, thus, homosexual individuals. The laws of Slovakia also allow transgender individuals to easily change their name and gender on legal documentation, including birth certificates (Maurice 2015). However same-sex marriage is still not legal, though it does have support, and same-sex couples cannot adopt children. Also, 36 percent of LGBT individuals in Slovakia reported being harassed or discriminated against because of their sexual orientation, less than the European average of 47 percent (Maurice 2015). But there have been attempts to pass antigay measures in the legislature and through the ballot box.

In June 2014, in a closed-door session with no debate, the members of parliament (MPs) from two political parties, the SMER, or Social-Democrats, and the KDH, the Christian-Democrats, voted to amend the Slovakian Constitution to define marriage as the union of one man and one woman. This referendum came after President Andrej Kiska was presented with a citizen's initiative with 400,000 signatures calling for a ban on same-sex marriage, a ban on same-sex couples adopting children, legislation that would make the benefits and securities of marriage only available

to married couples of one man and one woman (no civil unions), and an opt-out for parents who do not wish for their children to have sex education in schools. Providing opt-outs is more of a preemptive measure, as Slovakia does not have comprehensive sexual education in schools, and there are no plans to introduce sexual education. This initiative was organized by the Slovakian group Alliance for Family and supported by the Catholic Church and the American evangelical organization Alliance Defending Freedom (EU LGBT 2016).

The matter was taken to the Slovakian Constitutional Court. The court ruled that the questions on same-sex marriage, same-sex adoption, and sex education were constitutional. However, they ruled that the ban on civil unions or extending rights and protections to committed same-sex couples was unconstitutional. The referendum went to the people to vote on February 7, 2015. In Slovakia, 50 percent of eligible voters must cast ballots, for or against, to pass a referendum. By not voting, people were essentially casting a “no” vote. Each measure received more than 90 percent support from those who voted. But only 21 percent of eligible voters actually cast ballots, well below the 50 percent of voters needed, so the measure did not pass. The people of Slovakia decided that they knew what their country needed, not outside religious groups (EU LGBT 2016).

Reproductive and Abortion Rights

Reproductive rights in Slovakia is a complicated issue. The country has been censured by the European Court of Human Rights for its practice of sterilization of minority women, and nonminority women find it difficult to get access to birth control or abortion services. Additionally, information on birth control is not readily available to young people in sexual education classes in schools. Abortion in Slovakia is legal up to week 12 of pregnancy; abortions can be obtained past this time if the life of the mother is in danger, if the fetus shows genetic abnormalities, or if the fetus is not expected to be born alive or be viable outside the womb. Women who are seeking abortions for nonmedical reasons are forced to wait 48 hours between seeing the doctor to request the abortion and the performing of the abortion. The abortion pill misoprostol is not available in Slovakia, but it is available for purchase in neighboring countries. Online, there are five clinics listed that provide abortion services in Slovakia (Women on Waves 2016).

In 2013, the European Court of Human Rights heard the case of a Romani girl who claimed that she was sterilized in a Slovakian hospital without her consent or knowledge. The court held that in fact the hospital had sterilized the girl in violation of her human rights. Following this case, the European Court issued two additional judgments on cases from the early 2000s, which also involved the forced sterilization of Romani women and girls. These women claimed that their infertility issues were because of sterilization procedures that were performed on them without their consent or knowledge when they underwent caesarean delivery in hospitals located in eastern Slovakia. The women were not given complete access to the official documentation regarding their medical treatment in the hospital, which also became part of the case (Amnesty International 2016).

The European Court of Human Rights ruled that the government must grant people access to files containing their personal medical data and that the people are permitted to have these files copied. The court also ruled that sterilizations performed without full and informed consent amounted to a violation of the women’s rights, specifically the right not to be subjected to inhumane or degrading treatment. Additionally, it was a violation of the women’s right to respect for privacy and family life (Amnesty International 2013). The Slovakian government has requested that the cases be reviewed by the Grand Chamber of the European Court of Human Rights (Amnesty International 2016).

After these rulings, the Centre for Civil and Human Rights, a nongovernmental organization (NGO), censured the Slovakian government for its failure to investigate every alleged case of forced or enforced sterilization of women. They urged the government to apologize and to offer compensation to all women who were forcibly sterilized. In response to these rulings and the outcome of the Universal Periodic Review, the government of Slovakia announced that it had begun to adopt legislative measures to protect women from being victims of forced sterilization in the future (Amnesty International 2013).

These measures included requiring health care workers to seek the informed consent of women before performing a sterilization procedure. The government also created a new criminal offense for “illegal sterilization.” However, the Slovakian Ministry of Health has so far failed to issue or implement any guidelines regarding informed consent or sterilization for health care workers. Furthermore, the authorities have still failed to conduct fair, comprehensive,

and objective investigations into all alleged cases of forced sterilization (Amnesty International 2013).

While engaging in the forced sterilization of minority women, Slovakia also limits access to abortion services. In June 2013, the Slovakian Parliament included an amendment to the Law on Health Care and Health Care Services. This amendment required women who were seeking an abortion on request, an abortion not performed as part of medical treatment ordered by a doctor, to wait 48 hours after making the request. This amendment is a breach of World Health Organization (WHO) guidelines, which state that such waiting periods are an unnecessary delay in care and decrease a woman's safety. The amendment also required clinics and hospitals to collect personal data on any women seeking an abortion, such as their identity numbers (Amnesty International 2016).

Politics

The Slovakian government quickly adopted the provisions of the Beijing Declaration in 1997, drafting the National Action Plan for Women as their declaration that the country supports equality. However, this document did not contain any legislation or policies. This was followed by two more documents, the Concept for Equal Opportunities for Men and Women and then the National Action Plan for Employment. Even with all these acts and documents, there remains no comprehensive strategy for gender equality. This is reflected in the government, where women's representation has been low and sporadic. There have been women in Parliament since the foundation of Slovakia, even holding ministerial positions; however, it was not until 2010 that Ivetta Radicova was elected as prime minister, serving from 2010 to 2012. Women have begun to make headway in local politics, but on the national level, there is little support from women holding parliamentary positions.

Participation in Government

Women in Czechoslovakia won the right to vote in 1919, but this did not change the prevailing idea at the time, one shared throughout the world and across political ideologies, that a woman should not "poke her nose" into political discourse. Under the Soviets, a quota system was in place to ensure that women made up at least 30 percent of the legislative bodies. Unfortunately, this did not guarantee these representatives equal political power as their male counterparts (Bitusikova 2005, 1006). After Slovakia gained its independence in the 1990s, women were about

45 percent of the total labor force, but this was not reflected in their political representation. In fact, today, women are a visible and active part of Slovakian society, but they are still underrepresented in politics. Those women who do enter politics are reluctant to engage at all with women's issues out of fear that they will lose votes during subsequent elections. Slovakia's gender-blind policies and attitudes are seen as a reflection of female politician's lack of experience and understanding of women's issues and an absence of women's support networks (1007). Women make up around 15 percent of cabinet members, a number that shows no sign of increasing; however, they have been making gains in municipal politics (1011).

With each election cycle, the percentage of women elected to act as mayors (*starostky*) in small municipalities and lord mayors (*primatorky*) in towns and cities has been growing since 1990. This trend is especially seen in the smaller towns and villages; but as of 2016, no woman has been elected mayor in any of the eight regional cities, and few women have been mayors in larger towns and cities. In opinion polls, 45.2 percent of men and 33.6 percent of women find women's participation in local politics to be sufficient, and 25.6 percent of men and 42.1 percent of women consider it deficient (1012–1013). While women have been increasing their participation at the local level, the greatest barrier women face to entering politics appears to be family.

With 78.7 percent of women seeing their family and children as a barrier to entering politics, and 90 percent of Slovaks being married at least once during their lifetime, it is understandable that women are more comfortable entering the local political scene, which keeps them close to home, as opposed to national politics (1013). In fact, unless she has the permission and support of her spouse or other family members, it is rare that a Slovakian woman would begin a career in politics. Despite this, many women see their involvement in local politics as mayors as a kind of community service. They can identify and understand the problems of their village and its citizens and find solutions to the everyday problems people encounter. Being a mayor is not a step toward the national political scene, but is instead a commitment and a mission to their communities (1014–1015).

Legislation Concerning or Directed toward Women

Several different legislative actions directly affect women. These actions may focus on education and employment

equality, reproductive rights, and other aspects of women's lives. While Slovakia has been found to engage in the sterilization of Roma women, laws are in place that limit all women's access to abortion services and birth control. The amendment to the Law on Health Care and Health Care Services that requires a 48-hour waiting period after a woman's first appointment with a doctor is in violation of the WHO guidelines, which recognize such waiting periods as an unnecessary delay in care that can decrease a woman's chance of a safe abortion (Amnesty International 2016). Even with three acts promoting gender equality having been adopted in Slovakia, a lack of financial and organizational support has left Slovakian women to work their way up and fight workplace discrimination on a case-by-case basis through the legal system. The women in Slovakia are often turning to the European Union and the Court of Human Rights as well as other NGOs to help advance their cause.

Religious and Cultural Roles

The culture of Slovakia places emphasis on women's roles as wives and mothers. While many work outside the home to support their families, the jobs they do and their political aspirations are dictated by their families. This is possibly due to a strong Christian influence that focuses on the role of a woman as a helpmate to a man. In the last census, 69 percent of the population identified as Roman Catholic (Marriage and Family Encyclopedia 2016). But because of the Soviet influence that saw women as equally responsible for working for the state and equally deserving of an education, the church is not seen as having the authority to dictate the place of women in Slovakia.

Issues

As with many countries, no matter their equality of education, women can still be reduced to sex objects to sell. As of the writing of this essay, Slovak-republic.org, the country's tourism and information Web site, has a section titled "Women and Girls: What do Slovak women look like?" It begins with the site proclaiming, "Slovak women are the most beautiful women in Europe and maybe the world," a sentiment that seems like what any tourism site would put up. But after noting that 42.6 percent of women in Slovakia have a university degree, an opinion not shared by the Organisation for Economic Co-Operation and Development (OECD), the site begins to discuss having Slovakian women as girlfriends or wives and shows pictures

of Slovakian women. From some shots of model "Adriana Sklenaříková-Karembeu—Top model with the longest legs on earth, Queen of Wonderbra," you can scroll down to supermodel Andrea Verešová, with her breasts bare in one shot and her bum bare in another. It continues on to discuss how to date and marry Slovakian women. This section on tourism and women seems to be more like an advertisement for prostitution and mail-order brides than a come visit and meet friendly local people advertisement (Slovak-Republic 2016b).

Social Inequality

Slovakia is ranked 40th of 188 countries survived in the human development index (UNDP 2014), and considered to be a country of high human development with an expected 15 years of schooling per person. But what does this mean to the women of Slovakia? In Slovakia, young women, on average, go to secondary school longer than young men, and at the university level, more women gain bachelor's and master's degrees, earning near equal numbers of doctoral degrees. But men are still seen as having a place outside the home, and there are still stresses on women to be wives and mothers. Women make up only 15 percent of members of the Slovakian Parliament, but they are gaining ground as local mayors and community leaders. Women are supposed to have access to birth control and other reproductive services; but there are severe restrictions placed on abortion, and most insurance companies make women pay for contraception out of their own pockets. Women in Slovakia seem to be on par with women in other Western countries in terms of inequality between what is promised to them and what they receive.

Slovenia

Overview of Country

The Republic of Slovenia is a parliamentary democracy and constitutional republic situated in Central and South-eastern Europe. Slovenia has an area of 7,827 square miles, and it borders Italy, Austria, Hungary, and Croatia. Slovenia's climate is continental for the most part, characterized by cold winters and warm summers, while the Adriatic coast, with the length of 27 miles, has a sub-Mediterranean climate. Slovenia is a water-rich country. More than half of its territory is covered in forest that is home to various animal and plant species and diverse wild life. The population is 2,064,632. The capital of Slovenia is Ljubljana, with population of 279,000; it is also a political, cultural, and economic center. Other notable cities include Maribor, Celje, and Kranj. The majority of Slovenian population identifies as Slovene, at roughly 83 percent, and 2 percent identifies as Serbs, 1.8 percent as Croats, and 1.1 percent as Bosniaks (CIA 2016). Hungarians, Italians, and the Roma ethnic community have status as minorities in Slovenia, and their languages are protected. Roma women face significant challenges in accessing their rights and services, especially in respect to health.

Since late medieval times until 1918, Slovenia was a part of the Habsburg Empire. In 1918, Slovenia joined the newly formed Kingdom of Serbs, Croats, and Slovenes,

which later became the Kingdom of Yugoslavia. During the World War II, Slovenia was occupied by German and Italian troops. Following the liberation, Slovenia became a republic of the Socialist Federal Republic of Yugoslavia (Ramet and Fink Hafner 2006). Founded on the idea of equality among all people, but also on the state intervention in people lives, the socialist regime introduced policies that regulated all aspects of women's lives, which resulted in accessible child care, access to education, a high level of employment, and, somewhat later, access to abortion and birth control. However, during the socialist period, women's role was defined by a twofold identity: a woman as a worker and as a mother. While the working lives of women were regulated and planned by the state, the government was not always successful in assisting women to negotiate these two identities. Disparities particularly existed regarding the urban-rural divide, with more services and support available to women in the cities (Istenič 2007).

Following a brief conflict with the Yugoslav army, Slovenia declared independence from Yugoslavia on June 25, 1991. Slovenia joined the European Union in 2004, and in 2007, it introduced the euro as its currency. The transition from socialism to full membership in the European Union was marked with political, demographic, and economic changes, all of which significantly impacted women's lives. Today, Slovenia is a developed country with one of the highest gross domestic products (GDPs) per capita in Central Europe (CIA 2016).

In 2014, the UN Development Programme (UNDP) ranked Slovenia 1st out of 188 nations based on the Gender Inequality Index (GII), making Slovenia the country with the lowest gender disparity. The factors that contribute to this high score include a low adolescent birth rate, a high percentage of women with at least secondary education, and a fairly high level of women's participation in the labor market (UNDP 2015). Slovenia has been praised for its improvement of women's status and gender equality, especially in regard to bridging the gender pay gap. However, problems such as underrepresentation of women in political decision making and the burden of child-rearing remain.

Girls and Teens

Because of the country's high economic development, solid system of child care, and well-established health care services, most of the children in Slovenia are growing up in a safe and nourishing environment. However, children who

are marginalized because of their minority status, disability, or the low economic status of their families face prejudices and discrimination that affect all aspects of their lives. Roma girls often face significant obstacles, as they are more likely to live in poverty, and they are expected to enter marriage at an early age.

Due to widespread access to birth control, health and sex education in school, and access to gynecological clinics, Slovenia has an exceptionally low rate of teenage pregnancy (UNDP 2015). Slovenia invests resources in addressing the mental health issues of children and youth. In addition to a well-developed network of school psychologists, counselors, and health professionals that address issues of youth mental health, in 2001, Slovenia launched a publicly funded online initiative, "This Is Me," that provides quality, anonymous, and timely counseling services to teenagers. Thirty-eight experts support teenagers in solving their problems, and in over 10 years, this unique youth portal has responded to 21,000 queries, serving mostly teens from 13 to 18 years old (Lekić et al. 2011).

The number of children who attend elementary school is nearly 100 percent, and the literacy rate is high. The school reform in the mid-1990s placed gender equality as one of the priorities. In Slovenia, education is seen as factor that can ensure social mobility and is considered to be a vehicle for achieving gender equality; thus, girls and teens enjoy family support in pursuing their education (Antić 2006).

Education

The Constitution of the Republic of Slovenia guarantees equal access to education for all, regardless of gender, social status, disability, or any other personal characteristic. The law that regulates education lists promotion of gender equality awareness as one of its primary goals. Two areas in which Slovenia faces challenges are the inclusion of ethnic minorities and their languages, in particular the Italian, Hungarian, and Roma communities, and the inclusion of students with special needs in mainstream classrooms. While most of the schools and universities in Slovenia are publicly run and funded, there are also some private institutions in education, most of which are colleges and universities.

Primary and Secondary Education

Although they are funded and run by the local municipalities, preschool education in Slovenia is optional.

Kindergartens include children from 11 months to 6 years of age, and they are available as full-day programs, half-day programs, and, in remote areas, as short programs. The basic principles of preschool education are defined by the Kindergarten Curriculum, which outlines content, outcomes, and the evaluation of the learning process. Given the high level of employment of women in Slovenia, a majority of families are motivated to use kindergarten services. Because of this high interest, waiting lists are common, and certain groups of children, such as children considered being at “social risk” and children with special needs, are given priorities. The inclusion of Roma children in kindergartens is supported by special programs, including Roma assistants, who provide cultural and language support, thus facilitating the inclusion process by bridging the Roma community and the kindergarten.

Compulsory basic education starts at age of six, and lasts for nine years, consisting of three three-year cycles. Due to the government’s effort to ensure quality education for all, as of 2013, 6.5 percent of all children who attended basic education were children with special needs. Although many pupils with special needs are included in mainstream schools, the legislative framework and practice in Slovenia still recognize a dual-education system, and some pupils attend schools in specialized institutions away from their homes (Schmidt and Brown 2015). Slovenia also has public noncompulsory basic music and ballet education.

Secondary education is based on the model that is common among other postsocialist countries. Schools are divided into two types: different types of vocational schools (2–4 years), which provide pupils with skills that would allow them to enter the labor market or to enter higher education, and general schools (4 years) that prepare pupils for entering universities (Taštanoska, Žgank, and Pal 2015). While male students dominate the vocational schools, girls make up the majority in general schools. Moreover, secondary education is characterized by a gender imbalance regarding subjects, where male pupils dominate in the computer science and natural science areas and female students tend to choose subjects such as education. Consequently, a majority of teachers in Slovenia are women. Although they tend to take leadership roles in the educational institutions, there is a significant decrease in regard to the level of education: while most of the school principals in preschool education are women (96.3%), the percentages of women leaders in elementary schools (73.3%) and secondary education are smaller (56.1%) (Taštanoska, Žgank, and Pal 2015).

Higher Education

The government pays tuition for all students at the public universities. Students with limited financial resources are eligible to apply for government scholarships that cover living costs. While statistics in higher education used to indicate that women are more prone to choose “feminized” disciplines (i.e., languages, education), recent reports suggest that this gap is closing, with 10 percent more women in natural sciences, mathematics, and computer sciences in the last decade (Taštanoska, Žgank, and Pal 2015).

Legislation concerning higher education in Slovenia is fully in line with the Bologna Process, an initiative to create a European Higher Education Area that allows transferability and mobility in higher education. The harmonization of Slovenian laws with the Bologna Process allows for students from EU member states to study in Slovenia and for Slovene students to study abroad. According to one survey, 17 percent of students go abroad for some time during their studies. As Slovenia is a member of the European Union, Slovenian students can access exchanges and scholarships for studying in other member states, and the government funds students who study abroad. Due to its stable economy and high quality of life, Slovenia did not experience “brain drain” emigration of highly skilled researchers and scientists, which was common in other post-Yugoslav states. However, one study indicates that when young researchers decide to leave Slovenia to pursue their scientific career elsewhere, gender plays an important role in that decision. Namely, young women find it less difficult to earn acknowledgment abroad and thus consider leaving Slovenia to pursue scientific careers.

Health

Since Slovenia gained independence in 1991, the overall health of its population has improved. Although the life expectancy rose in the early 2000s and the mortality rates for people under 65 years of age have been decreasing, the inequity among different regions and populations has been increasing (Brown and Buzeti 2014). To tackle this disparity, the government crafted policies that aimed to reduce health inequity across regions.

Health insurance is compulsory in Slovenia. Contributions are related to the income, and the government provides the coverage for children and other categories that do not earn. After restructuring its system in 1992, Slovenia has one health insurer—National Health Insurance

Fund—through which 98.5 percent of the population is covered (Brown and Buzeti 2014). However, dental care is not included in this coverage and can be quite costly. The number of physicians and nurses per capita has been increasing; however, the numbers are still lower than in other EU member countries. According to available data for 2012, Slovenia had 2.5 physicians, 8.2 nurses and midwives, and 4.5 hospital beds per 1,000 population.

Slovenia has been working on implementing an electronic information system in health care (e-Health) since 2005. According to the current strategies outlined by the Ministry of Health, this goal is to be reached by 2023. The goal of this system is twofold: it would provide patients with better access to information, which will ensure inclusion and empowerment of patients, and the e-Health system will provide health professionals and policy makers with timely and more accurate information, thus facilitating the decision-making process in health care (Stanimirović 2014).

Childbirth and Maternal Health Care

After World War II, promotion of gynecology and obstetrics in Slovenia began, and medical doctors started assisting women in birth, thus replacing midwives and family members. At the same time, breastfeeding was replaced by industrial products, such as formulas. Long-practiced home birth was replaced by deliveries in hospitals, and this type of birth is prevalent to the present day. The worldwide initiatives and movement that advocated for more natural childbirth in the 1970s and 1980s also echoed in Slovenia. However, only recently, due to the excessive efforts of midwives, feminist activists, proponents of natural childbirth, and the global trends initiated by the World Health Organization (WHO), Slovenia has been offering different models of birthing practices (Prosen and Tavčar Krajnc 2013).

Doctor-assisted birth is still the dominant type of birth, but midwife care is available, although rarely utilized. Midwifery is in the process of professionalization. There are 14 maternity centers where women can give birth, and there is no assistance for home births. The first midwife-led unit was introduced in 2011 (Prelec, Verdenik, and Poat 2014). Doulas—birth professionals who act as an emotional support during birth—are available, although their access to maternity hospitals is not guaranteed, as there are limitations on the number of persons that can attend a birth. One study found that 21.7 percent of women experience

depression during pregnancy, while 15.7 percent of women reported an elevated level of anxiety. This study also suggests that depression is more prevalent among women of lower socioeconomic status (Podvornik Nuša et al. 2014).

After giving birth, women are visited by community nurses, who provide postpartum care and assist women in the care of their newborns, providing information and checkups. Thus, women encounter different professionals throughout their pregnancy: birth doctors, midwives, and community nurses. Research indicates that this discontinuity of care sometimes causes confusion and anxiety in women because they are given information from different sources about their pregnancy and birth (Prelec, Verdenik, and Poat 2014).

Slovenia was one of the countries that participated in the Baby-Friendly Hospital Initiative, a program launched in 1991 by UNICEF and the WHO. This initiative aimed to ensure that all birthing facilities provide support for breastfeeding. As in many other countries, this program was successful in Slovenia; both the initiation and duration of breastfeeding among Slovene mothers increased. With 93 percent of maternity hospitals designed as baby-friendly, Slovenia has one of the highest participations in this program (Bagci Bosi et al. 2016).

Diseases and Health Inequality

With 543 cases reported to the WHO in 2011, Slovenia has a low incidence of HIV/AIDS (WHO 2016). Common diseases in Slovenia include cancer and different heart conditions, both of which are leading causes of death. Health inequality reports suggest that due to an interplay of factors, such as lifestyle, nutrition, and access to information and services, level of education and socioeconomic status greatly influence the health of people in Slovenia—diseases are more prevalent among women with a lower level of education (Buzeti et al. 2011).

Some groups of women do not have an opportunity to benefit from government resources and services. In the case of Roma women's access to reproductive health services, prejudices of health care workers and a lack of intercultural dialogue create obstacles for full access to services (Logar, Pavlič, and Maksuti 2015). Furthermore, in addition to a prison system that provides health care that does not match the quality of community health care, the system in place is not equipped to address specificities of women prisoners' needs in regard to access to health care services (Vermeulen and European Commission 2011).

Employment

As previously mentioned, during the socialist period, employment of women was encouraged, and policies that aimed to increase the employment of women were in place. The feminist movement in this period advocated for the legislative and institutional framework that would ensure gender equality in Slovenia. Ever since Slovenia declared independence, the employment rates indicated an increase in women's participation in the labor force. Slovenia scores higher than other members of the European Union in some areas, such as overall participation of women in the labor force. In 2014, Slovenia was ranked 1st out of 155 countries based on the Gender Inequality Index (GII), and the participation of women in the labor market (52.3% compared to 63.2% for men) contributed to this high score.

Although women are protected from discrimination in the laws that regulate employment, and statistical data in respect to work conditions indicate that women have access to the labor market, Slovenia is still facing challenges in ensuring women full equality in the realm of work. The Slovene labor market is characterized by horizontal and vertical gender segregation; that is, women work more in the areas traditionally conceived as feminine (health, education, social work), and they do not occupy high positions in working organizations. Furthermore, women are less likely to be entrepreneurs, and because of the traditional gender roles, women still face challenges in accessing professions in agriculture, which is an important factor given that half the population lives in rural areas.

Maternity Leave and Child Care

To encourage better work-life balance and to provide women with more equal access to the labor force, in 2007, the government introduced the Family Friendly Enterprise certificate, which aimed to motivate employers to provide conditions for maintaining family life. In 2014, a new Parental Protection and Family Benefits Act was introduced that guaranteed women 105 days of fully paid maternity leave and 30 days of paid paternity for the other partner. Paternity leave, which is mostly utilized by fathers, is not transferable; this is supposed to motivate fathers to take the leave. Another factor that facilitates women's participation in the labor market is a solid system of child care and an increasing number of public kindergartens. Although Slovene legislation offers part-time employment as an option, most men and women work full-time (Humer et al. 2015).

Family Life

While a majority of people in Slovenia live in private households, 2 percent lives in some kind of institutional household (mostly retirement homes and student residences). The legal age of marriage in Slovenia is 18 years. In 2005, Slovenia introduced registered partnerships for same-sex couples. However, the nature of this partnership is limited, as it only regulates the financial relations of the parties involved and is not a legal equivalent to marriage (Kukura 2006).

With 1.1 divorces per 1,000 persons in 2013, Slovenia has the lowest divorce rate in the European Union. The rate of marriages per 1,000 is also low (3). Slovenia is among the countries where a majority of births occur outside of marriage (58% in 2013); this trend of extramarital births is prevalent in other EU member states, and it indicates that family structures are changing (Eurostat 2015). According to the population census from 2015, the average family in Slovenia has 2.47 members. Most Slovene families consist of a married couple with children, but with the increase of young couples without children, this is changing. Families in Slovenia do not have many children; a majority of families have one child (53%), followed by families with two children (36%). In general, it is rare to see families with many children. The census from 2015 for the first time collected data about same-sex families. There were 81 same-sex families, 64 without children and 17 with children (Dolenc 2016).

Gender Roles and Family Structure

Besides high rates of women's participation in the labor market, women in Slovenia still spend significantly more time than men doing chores and taking care of children. However, with the emergence of the new ideal of a proactive father, there is an indication that this is changing. More equal division of labor among men and women and active fatherhood has been promoted by government campaigns. Because the country is relatively small and family is traditionally valued (Antić 2006), family networks provide informal support in child-rearing and domestic labor. It is common that grandparents provide couples with support in caring for children. Grandmothers and other female relatives are particularly active in these informal supports (Švab and Humer 2013). Conversely, women's participation in this kind of informal care means that they are expected to provide care to children and elderly in the family. Although the government policies and campaigns call for a departure from traditional roles to build

more equitable practices, these initiatives are still directed toward a very narrow notion of family—a heterosexual couple with children. Thus, gay and lesbian couples and other nonstandard forms of families remain underrepresented in policy and discussions about equality.

Politics

Women in Slovenia were granted the right to vote in 1945. Today, voter turnout is the same for men and women (OECD 2016). However, the political participation of women is low on all levels of decision making, from municipal to the Parliament. Some political parties voluntarily established gender quotas in the 1990s. In 2006, Slovenia introduced gender quotas in all its decision-making bodies, including the upper house of the Parliament. The National Assembly Election Act stated that each gender should be represented with at least 35 percent of the actual candidates. This mechanism was supposed to increase the presence of women in decision-making bodies; however, these measures were not efficient. After the 2014 elections, women hold only 32 seats in the Parliament (36%). Women's participation in the government is far from gender parity.

Although women are more likely to hold high positions in local municipalities, the women's participation in local politics does not reflect the share of women in the population. By 2016, Slovenia had elected only one woman prime minister, Alenka Bratušek, who held office from March 2013 to May 2014. Slovenia has never had a women president, and women are rarely presidential candidates. Although this overview of Slovene politics indicates that women are not well represented in Slovene decision-making bodies, it is important to note that women in Slovenia take active roles in political life through nongovernmental organizations (NGOs), protests, and other initiatives. Through these instruments of nontraditional political participation and through professional organizations, women influence policy making.

Religious Roles

As in many other former Yugoslav countries, Slovenia experienced a revival of religious practices in the 1990s. Still, Slovenia is regarded as one of the least religious countries. The majority of the population (58%) in Slovenia follows the Roman Catholic Church. While 23 percent did not specify their affiliation by marking "other or unspecified," the other religions include Muslim (2%),

Orthodox Christian (2%), and other Christian (1%) (U.S. Department of State 2016). One study that investigates religiosity and gender roles suggests that women are more regular church visitors and are more prone to participate in religious rituals and practices, and, thus, they appear to be more religious. However, the same study suggests that women are more likely to reject religious beliefs that are opposing gender equality and egalitarianism. As evidenced in the recent campaign prior to the referendum on LGBT rights, some beliefs and attitudes that stem from Catholicism in regard to the equality of men and women in the household and the rights of LGBTQ persons are constantly being negotiated in the public sphere (Jugović and Ančič 2014). Although antiabortion practices that draw on religious beliefs are present, the overall low religiosity, the secularism of the Slovene state, and the strong tradition of women's rights make these incidents sporadic.

Issues

LGBTQ Rights

According to the Rainbow Index, an instrument developed and introduced by the international NGO ILGA-Europe, which looks at the legal framework for LGBT persons, in 2015, Slovenia was the 25th out of 49 European countries (ILGA-Europe 2016). What contributed to this score is recognition of same-sex partnerships, introduction of sexual orientation as a basis for asylum claims, and recognition of LGBT rights in the hate speech law. However, in Slovenia, the rights of same-sex couples do not correspond to those rights that heterosexual couples enjoy. At the referendum that took place at the end of 2015, almost two-thirds of voters rejected the right of same-sex couples to get married and to adopt children. During the campaign prior to the referendum, conservatives strongly opposed the right of same-sex couples to adopt children (BBC 2015). Although LGBTQ rights in the realm of family are not recognized, explicit homophobia in Slovenia is not as prevalent as in some other countries. Attitudes and practices in regard to sexual minorities are changing in a way that public opinion is more nuanced. The elections in 2014 for the first time included candidates that identified as gay and lesbian (ILGA-Europe 2015).

Spain

Overview of Country

With 195,364 square miles, Spain is considered the fifth-largest country in the Europe. It has an estimated population of more than 46.7 million, but this number fluctuates with the fluid immigration from many countries. Geographically, the country is in Southwest Europe and part of the Iberian Peninsula. The Pyrenees Mountains separate Spain from France in the north. Portugal and the Atlantic Ocean are to the west, and the Mediterranean Sea is to the east. The strait of Gibraltar separates Spain from Morocco, making this frontier one of the main points of entry to Europe from Africa (Ross, Richardson, and Sangrador-Vegas 2008).

The country has a constitutional monarchy with a parliamentary system. It has been a member of the European Union (EU) since 1986. It is also a member of North Atlantic Treaty Organization (NATO), the United Nations (UN), the Organisation for Economic Co-Operation and Development (OECD), and the World Trade Organization (WTO). Politically, Spain is divided into 17 autonomous communities, including the Balearic Islands in the Mediterranean and the Canary Islands in the Atlantic. It also has two autonomous cities, Ceuta and Melilla, in northern Morocco. Some of those communities have significant historical and cultural differences and enjoy a rich linguistic diversity. Spanish is the official language in Spain, but the Basque language (Euskara) is also the official language of the Basque autonomous community and Navarre, with a population of 2.5 million. However, the Basque territories, including the Basque region in southern France, have an estimated population of 720,000 speakers of Basque.

Catalan, a romance language, is also an official language of Catalonia. Most people in this autonomous community are fluently bilingual. It is also spoken in the bordering

regions, as 7.2 million people (of the 11 million population) speak Catalan in Catalonia, Valencia, the Balearic Island, some parts of Southern France, and the island of Sardinia, in Italy. In a small area of Val d'Aran (Aran valley) in the Pyrenees, Aranese and Gascon Occitan are also spoken and protected.

Galician, another romance language, closely related to Portuguese and Spanish, is used in Galicia, in the northwest of the peninsula and above Portugal. With an estimated population of 2,700,000, most people are bilingual, but 56 percent use more Galician than Spanish (Pereira-Muro 2003).

Overview of Women's Lives

As part of a patriarchal and traditional Mediterranean culture, women in Spain did not have legal rights until the 20th century, with a few regional exceptions for the rights to inherit and own property. Some of the main elements that have shaped women's lives in Spain are the role of the Catholic Church toward women; the period before and during the Spanish Civil War, from 1936 to 1939; and the following 50-year dictatorship and the transition to democracy from 1975–1982.

Spain has been considered a strong Catholic country for many centuries. It became infamous during the 16th century for its Inquisition and the persecution of people that did not practice the official Catholic faith. Over the centuries, the Catholic Church has practiced politics of fear among its congregations, especially with regard to women, favoring the macho culture of Mediterranean tradition. Still, before and during the Spanish Civil War (1936–1939), women enjoyed a period of freedom that they had never had before. During the Second Republic period, from 1931 to 1936, women were granted new rights. In 1931, they secured the right to vote. In 1932, laws were passed to ensure access and equality to jobs along with laws for divorce and civil marriage; abortion was legalized; and adultery was decriminalized. In short, at this time in Spain, women had more and better rights than many other European countries.

During these years, women were actively engaged in politics and civic society. Federica Montseny was elected the minister of health and social policy in 1936, making her the first female minister in Europe (Rodrigo 2014). Women also had their own organizations, such as *Mujeres Libres* (Free Women). But while they were gaining their rights, a civil war exploded, with the fascists fighting the

legally elected Republic. With the help of Hitler and Mussolini, the fascists won the war, starting a long dictatorship in 1939 that lasted until General Francisco Franco, the leader of the coup, died in 1975.

This was a dark period for many Spanish people. Women lost all the rights that they had acquired and were confined to the domestic spheres. Political violence was the basis for the new order, to the extent that it became institutionalized. It was used to destroy social practices and the political and social plurality created by the Republic. The Catholic Church played a crucial role, punishing women and, once again, playing politics of fear. Many women were repressed and incarcerated, and others were not allowed to work. Working-class women were forced to work for meager wages as punishment and retaliation when their families had been active during the civil war against the fascists, and also because women's salaries were lower than those for men. (Nash 2013)

The fascist government had a women's organization, *La Sección Femenina* (Feminine Section), whose objective was to present an image of the modern woman, a person who was a consumer of public life but who respected the domestic life and the superiority of men above all. In essence, it sponsored the same virtues of the Catholic Church of that period. During these years, macho attitude was allowed, and many women were victims of domestic violence. In the 1960s, late in Franco's dictatorship, women began to organize themselves by creating resistance movements and feminist awareness. Those organizations became transmitters for the memory of early feminism in Spain and created bridges for post-Franco reforms concerning women's rights.

Health

Spain guarantees universal health care coverage, education, and welfare for everyone, including legal and illegal immigrants, but not all Spanish people agree with these policies.

Abortion

Abortion was legal from 1932 to 1939, but women had to wait until 1985 for a limited abortion law, which was legalized again after much public debate and strong opposition by the Catholic Church that split the country (Ross, Richardson, and Sangrador-Vegas 2008). Illegal abortions were commonplace before 1985; poor and working-class

women were subject to very unsanitary abortions. Middle- and upper-class women traveled to England or the Netherlands to have legal abortions, but they did not have any health care when they returned to Spain. Because of the restrictions within the law of 1985, which limited abortions for up to three months of pregnancy in cases where pregnancy was a result of rape, danger to the mother's life, or malformation, the practice of illegal abortions continued to be prevalent until 2005. As a result, Spain's official abortion rate was the lowest in the European Union. However, between 1987 and 2005, the number of annual abortions increased from 16,000 to over 90,000 (Ross, Richardson, and Sangrador-Vegas 2008). A new law in 2010 legalized the practice of abortion during the first 14 weeks of pregnancy.

Education

The best progress for women so far has been in education. The number of women enrolled in Spanish universities now surpasses that of men, and female participation in business schools has also soared. Two decades ago, the percentage of female MBA candidates stood in the single digits. In two of the most prestigious private institutions, the business school Universidad de Navarra (IESE) and Escuela de Superior de Administración y Dirección de Empresas (ESADE), it varies from 20 percent at the Barcelona- and Madrid-based IESE to 44 percent at rival ESADE—though many of those students from outside Spain. The schools are expanding their efforts to attract women candidates, including mentoring programs and a growing number of scholarships for female students.

Public education in Spain has been criticized for decades, but it has been the foundation for the increase of women in higher education. Public education is free for everyone, including immigrants, legal or not. Private education follows the same laws as the public schools. Some of the private schools have religious affiliation, mostly Catholic, and can receive public funding. The literacy rate for women in Spain is around 97 percent. Education is compulsory until age 16. After that, students can choose two paths: a professional path for *formación profesional* (vocational training) and an academic one that continues with the *bachillerato* (baccalaureate) for two years. The latter has four options: humanities and social sciences, natural and health sciences, technology, and the arts. There are other opportunities for continuing education and distance-learning programs. Special education for students

with learning disabilities aims to integrate children in mainstream classes when possible. There is now the concept of “compensatory education” for people who, for whatever reason, failed to complete normal school education.

Today, the number of women enrolled in Spanish universities surpasses the number of men, even beyond the traditional career paths. In business fields, women’s participation has improved from the single digits to 40 percent at ESADE.

Employment

The new role of women in Spanish society has changed dramatically. Their formal education has increased along with their participation in the workplace. Single or married, women now constitute 51.6 percent of the workforce in Spain. Their strong presence has transformed the reality of men, women, and families. Women do not abandon their jobs because they get married or have children. As a result, birth rates have decreased. However, conditions for men and women in the workplace are not equal, as women earn 16–25 percent less than men; they also have more temporary jobs and are subject to double duties, both in the workforce and in the home.

Although some women now occupy influential and high-paying jobs in banking, business, and marketing, many others work in administration, services, and the tourist industries. Female doctors, lawyers, engineers, and scientists are on the rise, but they have a harder time finding jobs due to an ongoing economic crisis and lack of opportunities. Many of them leave the country for better opportunities, in Asia, Europe, Latin America, and the United States.

The military is one of the sectors where the presence of women has increased considerably since 1988, when new laws allowed women to serve. Now women constitute about 12 percent of army staff and 5 percent of officers, making Spain the first in the European Union in its proportion of female members in its ranks. (Ross, Richardson, and Sangrador-Vegas 2008) Another important area of advancement is the *Policía Nacional* (National Police). Until 1979, women were not allowed to serve there, but since then, the number of women has grown to 8,800, including ranking officials and inspectors, reaching one of the objectives of *Red Europea de Mujeres Policía* (European Network of Policewomen), which is asking not only for more female presence but also more access to commanding posts (Diario de Madrid 2015).

Immigration became a necessity for the economy after joining the European Union, when workers were needed in agriculture, construction, the auto business, the tourist industries, and services, among others. Today, many emigrant women working as domestic workers take care of the homes and the elderly, allowing Spanish women to join the workforce and participate in politics. Since the economic crisis in 2008, immigration has slowed down, but immigrants, and especially women, are a very important part of the society.

The Law for Effective Equality Act

The *Ley para la igualdad efectiva de Mujeres y Hombres* (Effective Equality Act), a major new law, was added in 2007. The law’s purpose is to combat sexual harassment and discrimination against employees who become pregnant. It extends maternity leave for women and paternity leave for fathers for a period of 15 weeks. It brings new measures to encourage equal opportunity in the workplace and requires companies to achieve a ratio of 40 percent female membership on their boards of directors in the next eight years. The same law also increases the number of female representatives in the political sphere, setting quotas for the minimum number of women candidates to be included on a party’s electoral list (Ross, Richardson, and Sangrador-Vegas 2008).

Family Life

Civil marriage was forbidden in Spain from 1554 to 1931. During the Republic, it was briefly legal. In 1939, under Franco’s rule, all civil marriages were nullified. The new constitution of 1978 allowed couples to have civil marriages again. It was not until 2009 that Spain had more civil marriages (94,933) than Catholic ones (80,174). Many people consider this is an indication of the secularization of the society. However, many couples married in religious ceremonies are not practicing Catholics; they are, as it is called, nominal Catholics. They are married, baptized, and have First Communion in the church, but very few attend Sunday Mass.

Traditionally, women in Spain keep their maiden names, using the father’s last name first and the mother’s last, a custom that continues today. Couples used to get married young and would have several children, but not today. Until 1975, women were required to get their husband’s permission before being active outside the home. Divorce, contraception, and abortion were not allowed.

Women's Voices

Anuncia Escala

I grew up in Spain during the dictatorship of General Franco's regime. In Catalonia, where I am from, most people are bilingual and speak Catalán and Spanish. However, under the dictatorship we were not allowed to speak Catalán in public. We spoke Catalán at home and with friends, and we spoke Spanish in schools and public arenas. At around five or six years of age, I thought my Spanish was pretty good. I liked translating words from Catalán to Spanish. Once I was asked to translate the Catalan word *gos* into Spanish (*perro*, dog). My response was simple. Adding an O to the end, *goso* was my new word, which provoked hilarious responses but made me feel ridiculous. We learned language by improvising, not from school.

A few years later, I guess I had a secret desire that I didn't know I'd had. Growing up in a Catholic culture church, services were a mystery to me. I liked the ritual and the sense of community I felt while in church. I used to pay close attention to the actions of the acolytes, how they dressed, their movements, and especially the bells they rung, but I never thought that it was something I wanted to do until I had a dream. I was at the end of the church in a section where I thought no one could see me ringing the bell as loudly as I could. Panic overwhelmed me when I realized, still in my dream, that people were watching me and saying "Look! It's a girl. It's a girl. What is she doing?" I woke up in a sweat.

Today in the Catholic Church, girls can ring the bells and read in public, but nothing more. We are still waiting.

When women separated from their husbands, as it was in many cases, they needed the permission of their husbands for any legal activity, from renting or buying property or even for obtaining a passport. Since the 1970s and 1980s, with more women working outside the home, many have become "superwomen," as they have to take care of their jobs and their homes. Today, the large majority of men work minimally on household chores or taking care of the children. This means a double life for many modern Spanish women; they are still responsible for the traditional

duties of taking care of the house and raising the children. According to Carmen Pereira-Muro (2003), this double duty affects the health of women due to high levels of stress; today, the consumption of pharmaceutical drugs to deal with such stress is high among women.

Currently, Spain has two of the lowest birth and fertility rates in the world, heavily affecting the population's replacement rates. People marry later, and couples wait to have children. Some do not have any. However, one or two children are common. For the moment, only immigration can balance this situation, simultaneously incorporating new values and lifestyles into Spanish society.

Contraception was legalized in 1978, but divorce and abortion required a great struggle to become legalized due to strong opposition by the Catholic Church and the political parties that supported the church's views. In 1981, divorce was legalized with several restrictions. One was that a spouse had to cite evidence, such as that they had been legally separated for at least a year (Ross, Richardson, and Sangrador-Vegas 2008). Because of these restrictions, many couples choose to live separately, an arrangement known as *divorcio a la española* (Divorce Spanish style), a practice that was initiated during Franco's dictatorship. Because of the restrictions, Spain has the lowest rate of divorce in Europe.

In 2005, a revised law has made it easier to obtain a divorce, which has led to an increase. Now it is possible to get a divorce within three months after getting married, or earlier if a spouse has been the subject of abuse by the other partner. Also, a judge can grant shared custody of the children, if this is beneficial for the children. This has increased the rate of divorce dramatically (Ross, Richardson, and Sangrador-Vegas 2008).

Politics

For women, the transition to democracy meant a revival of women's liberation movements. The 1978 Constitution for a democratic state proclaimed liberty, equality, justice, and political pluralism for individuals and groups. Civil rights were restored, including equal access to work, the restoration of voting rights, and the legalization of political parties, trade unions, and civic organizations. The feminist movement at the time was questioning its role, whether they needed to join the new parties or keep their independent organizations. The movement lost important leaders who joined the parties and held executive positions in several administrations.

Spain still has feminist organizations, such as *El Partido Feminista de España* (the Feminist Party of Spain), founded in 1981. It was the creator of *Federación Organizaciones Feministas* (Federation of Feminist Organizations) in 1999, which participated in the elections for European Parliament and received 28,901 votes, 0.14 percent. Today, it is part of this federation in Spain, but it does not have public activities. Several other feminist organizations are also active, but with little political representation. On the other hand, women began to participate in elected government institutions, as mayors of large and small towns, representatives in the congress, senators, and ministers. There was a significant rise in women elected during the 1989–1993 legislatures, when their participation rose to 14 percent. By 2012, it had grown to a 34 percent.

During his second term, José Luis Rodríguez Zapatero, a socialist prime minister, formed a cabinet with a female majority, consisting of 9 women out of 17 ministers. Perhaps his most important appointment was the young Carmen Chacón as minister of defense when she was pregnant. Rodríguez Zapatero also created a new title called the minister of equality. It was the first time in Europe that a government had more female than male ministers. Also, for the first time, Spain had a Ministry for Equality that dealt with domestic violence more forcefully than any previous cabinets. In 2004, when the socialist president Rodríguez Zapatero came to power for the first time, domestic violence was prevalent and not dealt with adequately. He created new and better measures for women to obtain restraining orders, which were poorly enforced before; he provided refuge provisions and courts to deal with domestic violence. He also improved the lives of caregivers in Spain, who were mostly women.

Issues

Domestic Violence

In Spain the issue of domestic violence has been an acute problem. Several steps and awareness programs have been implemented. However, in a society where the machismo ideology still prevails and many judges have not accepted the seriousness of the problem, progress has been slow. In any case, since the late 1990s, cases of domestic violence have been receiving greater attention in the media. Until the new divorce laws were passed in 2005, it was difficult for women to escape domestic violence due to the lack of judicial support. (Pereira-Muro 2003). About 60 women are murdered by their partners or former partners every

year (Ross, Richardson, and Sangrador-Vegas 2008). In 2004, the government passed the *Ley Integral contra la Violencia de Género* (Gender Violence Act). The law has a wide range of provisions to protect the victims of gender violence. Victims can go to the police to report an aggression, but they often do not get protection or legal action. As a result, such crimes are often never reported. Many people complain that while Spain has made advances in helping victims, it has not been enough. TV channels have programs where they interview victims and sometimes the aggressor as a way of denouncing the problem, but they also have programs where gender violence is represented without criticism.

LGBT Issues

The contrast in how homosexuality in Spain was seen just a few decades ago and today is enormous. If you walk around the neighborhood of Chueca in Madrid, or the Eixample in Barcelona, it is hard to imagine a country where homosexuality was forbidden. In the past, it was culturally accepted that gay people were unnatural because homosexuality was considered a sin and a pathological disorder by the Catholic Church. Between 1954 and 1970, around 5,000 people were imprisoned for homosexuality. A law was passed in 1970 to allow the rehabilitation of lesbians and gays with various forms of treatment, including electric shock therapy.

Nevertheless, a clandestine movement developed in the 1960s in Barcelona, where gay activists formed the Catalan Liberation Front in 1975 (Ross, Richardson, and Sangrador-Vegas 2008). In 1998, a law called *Ley de Parejas de hecho* (De facto Partners Act) was passed in Catalonia. The law stipulated the same rights for same-sex couples living together as those enjoyed by heterosexual couples, but it did not include the right to adopt children (Ross, Richardson, and Sangrador-Vegas 2008). During the 1990s and early 2000s, several city councils and autonomous communities allowed civil unions, giving the same benefits as married couples to unmarried couples of any sex.

In 2005, Spain legalized same-sex marriage. It was the third country in the world to legalize it, after Belgium and the Netherlands. Approximately 4,600 people were married the first year. The same law allowed the adoption of children. The current government is against the law, but so far they have not been able to repeal it.

The law establishes that marriage has the same requirements and privileges regardless of whether the individuals

are of the same sex. At the same time, it allows couples who have lived together for a long time to adopt whether they are homosexuals or heterosexuals. Equal rights are also guaranteed for single people to have the right to adopt.

In cases where children were born in a lesbian marriage, the biological mother was the parent, but the nonbiological parent did not have any rights. The nonbiological parent had to apply for a long adoption process. In 2006, the government amended the law on assisted reproduction, granting the same rights to the nonbiological mother as the birth mother.

On October 2, 2014, the parliament of the Catalan autonomous community approved a law against homophobia with a large majority of votes, 112 in favor and 18 against, to protect lesbians, gays, bisexuals, and transsexuals. This law, the first in Spain, is to guarantee the rights of the LGBT communities, to prevent situations of discrimination and violence against such persons, and also to facilitate their participation and representation in all aspects of social life.

Immigrant Women in Spain

Immigrant women, coming from any different areas of the world, have made significant and important contributions to Spanish society. Even though in 2014 the Chinese immigrant population was the only one that grew in some communities, such as in Madrid, in Spain, the majority of immigrant women are from Eastern Europe, Latin America, and North Africa. Their motive for coming to Spain was mostly for family reunification, but over the years, many women have come to Spain looking for jobs, especially those from South America. The need for domestic work in Spanish households is creating a global feminine market for those immigrant women.

Families favor Latin Americans, but the number of Eastern European women working as domestics in homes is growing. Women coming from the Andean region, Ecuador, Bolivia, and Peru are the most sought after because they speak Spanish and share the same strong Catholic beliefs as many older Spaniards. Many of these women left their countries because of an economic crisis. They usually have at least a high school diploma, and some are nurses, teachers, or had previous professional careers. In Spain, they are especially preferred for taking care of the children and the elderly. Romanian women are also more accepted for the same reasons. North African women from Morocco work in the households doing domestic duties, but because

of prejudices and discrimination related to their Moroccan customs and religion, they are more rejected by Spanish society. In some cases, the language barrier is a factor, as some of these women do not speak Spanish. Nevertheless, the roles of all these groups of women in Spanish society are growing in all sectors, especially the service and tourist industries (Molpeceres Alvarez 2012).

Women from Latin America carry a double burden because they have to take care of other people's families to economically support the families they left behind. Many of these women pay for the education of their own family's children, including college, in their countries of origin. But the distance and lack of personal contact creates difficult situations for the immigrants because sometimes the children see their own mothers as moneymaking machines. Some women immigrants have a very lonesome existence. The film *Flores del otro mundo* (*Flowers from Another World*, 1999), by Icíar Bollain (1967), a female Spanish filmmaker and actress, portrays the difficulties of their lives in Spain and the world they left behind, as well as the loneliness, conflicts, and rejections they face.

Second-generation immigrants have been integrated into the education system since childhood and have different attitudes and challenges. They can become professionals in many fields, but sometimes they are not fully accepted. The writer and professor Najat El Hachmi (1979), a daughter of Moroccan parents, has published several books about this. *Jo també soc catalana* (*I Am Also a Catalan Woman*, 2004), an autobiographical account, tells the story of growing up as an immigrant girl in Catalonia. It focuses on her relations with language, identity, the role of women, religion, and lost sentiments, along with her feeling of belonging to Catalonia, her adopted country. Her second novel, *El último patricarca* (*The Last Patriarch*, 2008), deals with immigration, but mostly with the struggle of a woman who had a tyrannical father whom she still loved.

Women in Film and Television

Television and movies play an important role in the social fabric of Spain. Spain has many successful women filmmakers and actresses, but the large number of women in the industry work as specialized professionals (Arranz, Roquero, and Aguilar 2012). The role of women in this media is contradictory. While Spain still produces soap operas where women tend to be the victims, it has also developed strong roles for women. The filmmakers that

follow represent this latter tendency, along with a strong interest in social justice issues. Pilar Miró (1940–1997), a Spanish filmmaker, was the director of national television from 1986 to 1989. She worked in more than 200 film and TV productions.

Isabel Coixet (1960–) worked first in advertising, where she developed a unique visual style. Her films are original, dealing with universal and intimate feelings. She is the most international of the women filmmakers, directing and producing films abroad as well as in Spain. Her documentary *La mujer, cosa de hombres* (*Women Belong to Men*, 2009) was part of the 50th anniversary of the national TV network. This documentary presented footage of films from the 1960s that portrayed women unhappy with their relationships with men, along with scenes of domestic violence. Using real footage from newsreels, the film stops from time to time to report cases of domestic violence occurring in that era. It also incorporates advertisements from the 1960s that portray women as inferior beings.

Icíar Bolláin (1967–) is an actress, filmmaker, and scriptwriter. She has acted since childhood. She is also the director of six feature films. *Flores del otro mundo* (*Flowers from the Other World*, 1999) about immigrant women from Latin America in Spain was previously mentioned. Her film *Te doy mis ojos* (*Take My Eyes*, 2003), a movie about domestic violence, won seven Goyas, the most prestigious awards in Spain. Her film *También la lluvia* (*Even the Rain*, 2010) made it to the short list for the 83rd Academy Awards in 2011. Her last work, the documentary *En Tierra extraña* (*In Foreign Land*, 2014), follows young Spanish immigrants to Edinburgh, where an estimated 20,000 are looking for work and better opportunities. Since the economic crisis of 2008, an estimated 700,000 young people have emigrated from Spain.

Women in Spanish movies are now portrayed in many different ways, from traditional roles, to professional women, to objects of desire. Many of the characters have a common wish for independence and sexual freedom. There is debate about whether this is the desire of Spanish women or the dream of Spanish men. In any case, a large number of excellent actresses have devoted their talents to portraying very different characters. Victoria Abril (1959–), Ariadna Gil (1969–), Blanca Portillo (1963–), Emma Suárez (1964–), and Isabel Verdú (1970) are among the best known, to mention only a few. The complex characters these actresses bring to life are an indication of the changes Spanish women are going through today.

Women Leaders in Social Movements

Almudena Bernabeu was born in Spain in 1972 and studied law at the University of Valencia, Spain. She is the only Spanish woman working in the field of universal civic justice, simultaneously in Spain and the United States. As a well-known lawyer specializing in international law and human rights, she has dedicated her life to investigating and preparing cases of human rights abuse in Latin America and in Africa. Since 2003, she has been the director of the Center for Justice and Accountability (CJA) in San Francisco, California. In Spain, she has been the lead private prosecutor before the Spanish National Court in cases concerning genocide in Guatemala during the 1980s. She and her team were leading advisers to the prosecution in the Guatemalan genocide trial against former president Efraín Ríos Montt in 2013 (McConahay 2013). Her work is featured in the 2011 documentary *Granito: How to Nail a Dictator*. She was instrumental in achieving the prosecution of the Salvadorian military junta for the massacre in El Salvador in 1989, where six Jesuit priests were killed along with a housekeeper and her daughter. She is constantly working on cases in Central and Latin America. She teaches law at the University of Berkeley and has received several international awards for her work. She is also the vice president of the Spanish Association for Human Rights. In 1912 *Time* magazine included her in its list of the 200 most influential people in the world.

Two Spanish women, Carme Forcadell (1956–) and Muriel Casals (1944–), are leading the Catalan independence movement. Carme Forcadell is a linguist and a Catalan political activist. She is the president, since its founding in 2012, of the Asamblea Nacional Catalana, a grassroots organization working for Catalonia's separation from Spain. Muriel Casals was born in France to exiled parents. She is an emeritus professor from the Department of Economics at the Autonomous University of Barcelona. Since 2010, she has been president of Omnium Cultural, a nonprofit organization working for the promotion of the language and culture of Catalonia. Both organizations do not have partisan political affiliations, but rather sponsor peaceful and creative demonstrations for change to make politicians accountable. Together, these women are leading a very large Catalan movement for independence from Spain. Some of the demonstrations they have helped to organize were attended by more than 1.8 million people. Their works channel the energies of many Catalan people who believe independence for Catalonia

is the best solution after many centuries of conflict with Spain.

Ada Colau (1974–) is another social and political activist from Barcelona and a leader for the *Plataforma de Afectados por la Hipoteca* (PAH, Platform for People Affected by the Loan Crisis). The organization was created as a response to the 2008 financial crisis, which exposed the corruption of the banking industry in Spain. The PAH was set up in Barcelona in 2009, and it now has 150 branches across Spain. She is the coauthor of *Mortgaged Lives*, which was based on the grassroots experiences of direct action with the PAH to stop evictions and to campaign for housing rights. Since 2014, she is the spokesperson for the organization *Guanyem Barcelona* (Let's Win Back Barcelona), a citizens' platform for the 2015 Barcelona city elections. Ada Colau has won several awards, including the European Citizen's Prize for her work with PAH in 2013, and the European United Women Prize in the same year.

Teresa Forcadas i Vila was born in Barcelona in 1966. After studying medicine in Barcelona, in 1995, she became a doctor specializing in internal medicine at the University of Buffalo. She moved to Harvard, where she completed a Master of Divinity degree in 1997. Upon her return to Barcelona, she became a nun at the famous Santa Maria de Monserat Abbey, near Barcelona. In 2004, she received a doctorate in public health, and in 2009, she obtained a doctorate from the School of Theology in Catalonia. Sister Teresa is considered a Christian feminist and teaches feminist theology in her convent and gives public lectures. She is also an advocate for public health issues and is an activist for Catalan independence. She is well-known for her controversial public-speaking appearances. She has expressed more than once that "the Roman Catholic Church, which is my church, is misogynist and patriarchal in its structure. That needs to be changed as quickly as possible" (Tremlett 2013).

Sister Teresa defends the right of women to become priests, bishops, or pope, searching for total equality inside and outside the church. Before taking her vows, she gave a talk to her fellow nuns about a group of gay Catholics who celebrate their sexuality as a gift from God. She also defends contraception and believes abortion is an individual choice. During the swine flu pandemic in 2009, she denounced the politics of medical and industrial groups that declared it a pandemic. She claimed the flu vaccine they promoted lacked scientific basis for public use, and she listed irregularities and the consequences of declaring it a "pandemic" (Forcadas 2014).

On the political front, Sister Teresa supports Catalan independence and proposes a government model based on social mobilization and self-organization. She coauthored a declaration with Arcadi Oliveres, an economics professor from Barcelona University, with the title *Manifesto for the Convening of a Constituent Process in Catalonia* (2013).

Contemporary Women Writers

The transition to democracy in the 1970s led to a boom of Spanish women writers. Compared to other Western nations, the feminist movement in Spain came late, due to the Franco dictatorship that ended in 1975. However, women have been writing about women's issues long before that, and several writers have published such works since the 1960s. Mercé Rodoreda (1908–1983) is considered the most important Catalan writer of the postwar period. Her well-known 1962 novel *La plaça del Diamant* (*The Time of the Doves*) became a hit in the 1960s, and it has been translated into over 30 languages. Other well-known Spanish writers from the same period include Maria Zambrano (1904–1991), Carmen Laforet (1921–2004), and Ana María Matute (1925–2014). Carmen Martín Gaité (1925–2000), a writer, actress, and a playwright, was the first woman to win the National Award for Literature for her novel *El cuarto de atrás* (*The Back Room*) in 1978. That was the beginning of her awards as a writer. She went on to write 18 more books as well as essays, children's literature, and film scripts.

Many other writers from the post-Franco generation deal directly and critically with women's issues, their sexuality, and their roles in society. Cristina Fernández Cubas, Carmen Posadas, Soledad Púertolas, Carme Riera, Esther Tusquets, and Ana María Moix are only a few of them. Others continue exploring the narrative of memory, such as Dulce Chacón (1954–2003), the author of *La voz dormida* (*The Sleeping Voice*, 2002) a very popular novel that used testimonials she had collected from women about the difficult years of the postwar period.

Special mention is necessary for Almudena Grandes (1960–) and her novels dealing with female eroticism and desires (Bergman 2007). Several of her novels have been turned into movies: *Las edades de Lulu* (*The Ages of Lulu*, 1990); *Melena es un nombre de tango* (*Melena Is the Name of a Tango*, 1995); and *Los Aires difíciles* (*The Wind from the East*, 2006). She also writes a weekly column for the newspaper *El País* as well as other journals and magazines.

In literary journalism, women writers have found their niche, writing for periodicals and specialized publications and using humor to convey their sociocultural critiques. Some also contribute to radio, television, and the film industry as scriptwriters. Literary journalism gives these writers opportunities to report on cultural trends and social problems and to engage with the public.

Rosa Montero (1951–) is a writer as well as a journalist. Her 1981 novel *La función Delta* (*The Delta Function*) is considered a major work of feminist thought. She collaborates weekly with the newspaper *El País* and has won the National Journalism Prize many times. Her writing reveals the situation of women, but it also focuses on political corruption and the lack of national unity.

Montserrat Roig i Fransitorra (1946–1991) was a prolific writer and journalist and also a professor of Catalan at the University of Barcelona. She wrote short stories, novels, and children's books. Her well-known and rigorous report *Els Catalans als camps Nazis* (*Catalans in Nazi Concentration Camps*, 1977) received several awards.

Elvira Lindo (1962–) is famous for her children's series *Manolito gafotas* (*Manolito Four-Eyes*, 1994) that was turned into a movie in 1999. She was awarded the Premio Nacional de Literatura Juvenil in 1998. She has been a correspondent for the newspaper *El País* in New York for several years.

Empar Moliner (1966–) is best known for her collection of essays *Busco senyor per amistad i el que sorgeixi* (*In Search of a Man for Friendship and Possibly More*, 2005). In her essays, she touches on topics that are everyday news, such as the future of the Catalan language or the situation of immigrant women, in this case Peruvian women looking for jobs as maids. Her representations are realistic and use irony to convey complex situations with humor.

Women in the Arts: Dancers, Singers, and Actresses

Spain has a long tradition of women as actresses, dancers, and singers in both popular and classical music, including flamenco. What has changed in the last century is their professionalization. Many flamenco women now have their own companies and direct, create, and produce both plays and music in this genre.

Legendary flamenco dancer Carmen Amaya (1918–1963) was born in a gypsy family of flamenco musicians and dancers in Somorrostro, a slum in Barcelona. She revolutionized flamenco dancing with her unique style and

was accused by some critics of defeminizing flamenco dancing, but others admired her for liberating the female style of dancing.

Mecaela Flores Amaya, or “La Chunga” (“the Difficult One”), another flamenco dancer, was born in Marseille circa 1938 of immigrant Romani parents from southern Spain. She became famous for her unorthodox ways of dancing. Cristina Hoyos Panedero (1946–), also a flamenco dancer, is an actress and choreographer. She has worked with many different dance companies as well as her own and has played an important role in the world of flamenco dancing for women.

Spain has a rich and original variety of singers. To mention only a few, Estrella Morente (1980–), a flamenco singer from Granada, was born into a famous flamenco family; her father was a singer and her mother a dancer. Her voice and songs have been used in several movies. Silvia Pérez Cruz (1983–), from outside Barcelona, had classical musical training. While a student, she cofounded the flamenco group *Las Migas* (Bread Crumbs), which created a particularly unique sound. She sings in seven languages, including four of the Iberian languages: Catalan, Galician, Portuguese, and Spanish.

The Basque culture has a long tradition of choral singers. A few of the best-known Basque women singers come from this tradition. Singing in Spanish, the popular pop group *Mocedades* (Youth), from Bilbao, was founded in 1969. The lead singer, Amaya Uranga, left the group in 1984 to continue her solo career. The pop rock group *Oreja de Van Gogh* (Van Gogh's Ear), from Donostia-San Sebastian, is a Latin Grammy-winning and nominee group. Their lead singer, Amaya Montero, also left the group for a solo career in 2007. Opera is another genre where Basque women have excelled. The soprano Ainhoa Arteta is the most international of all the Basque opera singers. She has performed in prestigious opera houses around the world, including the Metropolitan Opera in New York, the Royal Opera House and Covent Garden in London, and La Scala in Milan.

Sweden

Overview of Country

Sweden is located in Northern Europe and is bordered by the countries of Norway and Finland as well as the Baltic Sea and Gulf of Bothnia. Roughly 174,000 square miles (450,295 sq. km), Sweden has a mountainous border to its west and a mostly flat or rolling terrain in the east. The country had an estimated population of 9,723,809 in 2014, which is primarily concentrated in the southern half of the country and in urban areas, with 85 percent of the population in urban centers. Approximately 15 percent of Sweden's population is foreign born.

The Swedish state dates back to the 1500s, though its borders and separation from Norway were not permanently fixed until 1905. Sweden has a constitutional monarchy led by King Carl XVI Gustav. His daughter Crown Princess Victoria (1977–) is heir apparent and will become Sweden's fourth queen regent and first since 1720. Sweden has a parliamentary democracy driven by its 349-member *Riksdag* (Parliament); general elections are held every four years. Women hold 44.7 percent of the seats in Parliament. Sweden has been a member of the European Union since 1995, though the public rejected the introduction of the euro in a 2003 referendum.

Voting rights are extended to all Swedish citizens aged 18 and older. Women received the right to vote and run for office in 1921, and Sweden's first female Parliament representatives were elected that year. Sweden has a high voter turnout rate for both men and women, at approximately 90 percent. Eight parties are currently in the Parliament: Social Democrats, Moderates, Sweden Democrats, Green Party, Center Party, Left Party, Liberal Party, and Christian Democrats. Only in the past decade have the Swedish Democrats, the extreme right-wing party known for its stance against immigration, gained influence in Sweden. Sweden's feminist party, the Feminist Initiative, narrowly missed a seat in the 2014 Parliament.

In 2014, the UN Development Programme (UNDP) ranked Sweden 12th out of 187 nations on its Human Development Index. Sweden has a maternal mortality ratio of 4 deaths per 100,000 live births and an adolescent birth rate of 6.5 births per 1,000 women aged 15–19. Women have a 60.2 percent labor force participation rate, while the rate for men is 68.1 percent. Some secondary education is attained by 86.5 percent of women (UNDP 2014). The

2014 *Global Gender Gap Report* ranked Sweden 4th of 142 countries. In 2006 and 2007, Sweden was ranked 1st. The reasons for Sweden's drop in the ranking are largely attributed to stagnation and improvements in other countries (WEF 2014).

The government of Sweden has implemented the UN gender mainstreaming approach that requires all policy areas to have a clear gender perspective. It works toward the objective that women and men have the same power to shape society and their own lives. This approach includes four key objectives: (1) an equal distribution of power and influence; (2) economic equality; (3) equal distribution of unpaid care and household work; and (4) stopping men's violence against women (CEDAW 2014).

The Swedish Discrimination Act, approved in 2009, states that "no person may be discriminated against or prevented from enjoying their rights on account of sex, transgender identity or expression, ethnicity, religion or other belief, disability, sexual orientation or age" (CEDAW 2014, 4). The act provides comprehensive protection in multiple areas of society, from working life, education, and the labor market to housing, health care, military service, and social services. The 2009 Discrimination Act brought together several previously existing laws to address discrimination more holistically. While this goal was appropriate, the Swedish government also chose to eliminate the term *race* from the act. The elimination of the term without an appropriate substitute has left a void in legal proceedings concerning racial discrimination, according to many scholars and policy makers (UNAS 2013).

Sweden is renowned for its near two centuries of armed neutrality, particularly during both World Wars. However, the country endures continuing criticism for its enablement of Nazi Germany and its contemporary production and provisioning of weapons to countries throughout the world (Democracy Now 2014). Moreover, Swedish research institutions were world leaders in race biology research of the late 19th and early 20th centuries, and Sweden had a large eugenics program that forced sterilization of individuals considered to have undesirable traits and individuals undergoing sex changes (Björkman and Widmalm 2010).

Sweden is recognized as one of the most progressive countries in the world for women and LGBT persons. For example, in 2012, Sweden adopted the gender-neutral term *hen* as an alternative to the gendered *hon* (she) and *han* (he). Gender-neutral marriage was put into law in 2009. Sweden offers 480 days of parental leave, shared between

both parents, and it has one of the highest female labor force participation rates in the world. Women, however, still earn less than men, take more parental leave time, and do more unpaid household work, to name only a few of the remaining inequalities.

Sweden recognizes five historic national minority groups, all of which share a long history in Sweden and have experienced linguistic and racial discrimination historically and in the present. These include Jews, Roma, Sámi, Swedish Finns, and Tornedal, and Sweden recognizes five corresponding minority languages: Yiddish, Romani Chib, the Sámi languages, Finnish, and Meankieli. In accordance with the European Charter for Regional or Minority Languages, a key goal of protecting national minorities is to protect the right to use minority languages in public and private contexts and recognize them as part of the Swedish cultural heritage (Regeringskansliet 2007).

Yet, Swedish scholars and researchers have been slower to incorporate an antiracist feminist approach in their discussion of women's experiences in Sweden (Måwe 2014). Sweden does not compile official statistics on ethnicity due to a law protecting individuals' privacy; thus, research on women's experiences is often homogenizing. Research tends to focus on the middle class or on differences between Swedish-born and foreign-born women. This is due to a lack of data on such issues as health, education, and labor disparities disaggregated by the ethnic identities of women (UNAS 2013). This situation entails that the intersecting experiences of these individuals as women and minorities are often invisible and makes it more difficult to plan appropriate policies.

Girls and Teens

Girls and teens in Sweden attend compulsory school from ages 7 to 17, though many begin and end their studies earlier in preschool and later in upper secondary and university. The school year starts in mid-August and ends in mid-June. One in five children in Sweden has a family with roots in another country, primarily Iraq, Somalia, Poland, or Thailand. Approximately 14,000 of them were adopted from another country. For newly arrived immigrants, children have been forced to wait a long time before being enrolled in school in several municipalities. These students are sometimes segregated, placed in special introductory classes, and rarely receive education in all subjects, like other students (UNAS 2013).

Sex Education

Sex education is required in the school system and treated as an interdisciplinary area of knowledge that includes biology, civics, history, and religion. The principal of the school is responsible for integrating knowledge about sex and human relationships into various subject areas, giving local schools flexibility in their implementation (CEDAW 2014). Sweden's sex education advocacy group believes that the education could be better by focusing less on reproduction and sexually transmitted infections (STIs) and more on discussions about bodies, relationships, values, and society's views on sex. They also believe that teachers need compulsory sex education training (RFSU 2010). Training for staff in sex education and human relationships was commissioned in 2008–2010 and 2011–2014.

Sports, Leisure, and Cultural Life

The national sports policy is to give girls and boys, women and men, the same conditions for participation in sporting activities. However, the allocation of public funds for sports and culture organizations among young people provides more funding to men's associations. In children's organized sports in 2011, boys accounted for 60 percent of sessions and girls for less than 40 percent. Soccer is the most popular sport among girls and boys. Girls leave organized sports more often than boys when they become teens. Twenty-nine percent of girls and 26 percent of boys between the ages of 13 and 15 play a musical instrument. One-third of 13- to 15-year-olds watch TV at least three hours per day, and one-third of 12- to 16-year-olds surf the Internet for 3 hours per day (Swedish Institute 2014a).

Education

Preschools, Compulsory Schools, and Upper Secondary Schools

Sweden's Education Act (2010) states that preschools and schools have a mandate to combat traditional gender patterns, and all children must have an opportunity to try out and develop abilities and interests without being limited by their gender. The curriculum states,

The school should actively and consciously further equal rights and opportunities for women and men. The way in which girls and boys are treated and assessed in school, and the demands and expectations that are placed on them contributes to their perception

of gender differences. The school has a responsibility to counteract traditional gender patterns. It should provide scope for pupils to explore and develop their abilities and interests independently of gender affiliation. (Ministry of Education and Research 2014, 12–13)

The Education Act also states that everyone must have equal access to schooling within the education system, and provisions are made to promote equal rights irrespective of gender, transgender identity or expression, ethnic origin, religion or other belief, disability, sexual orientation, or age.

Sweden's Education Act also integrates preschool into public education. Public preschool was introduced in 2010 for children from the age of three, with the understanding that no family should be denied the opportunity for their child to attend preschool due to financial reasons. In 2012, 84 percent of all children aged 1–4 attended preschool, and there was an equal distribution between girls and boys (Ministry of Education and Research 2014).

Education is compulsory for children at the age of 7. Preschool and later compulsory education are offered in the student's first language when appropriate to develop speaking and writing skills. Approximately 54 percent of those entitled to first-language education participated in 2012, though children and their parents are sometimes unaware that their child has the right to education in their first language (UNAS 2013).

Upper secondary school is voluntary and free, and 98.7 percent of students continued into upper secondary school in 2012. Though no gender differences exist in terms of applications to upper secondary school, major differences remain in the gender distribution within the majority of Sweden's 18 different programs of study. These include programs such as history, natural sciences, and health. Women were proportionally higher in handicraft, health and social care, and the humanities, while men constituted 90 percent of the students in HVAC and property maintenance, electricity and energy, buildings, and construction. Economics was the program with the most even gender distribution. The differences in the type of education men and women choose impacts their future working life, particularly differences in pay (Ministry of Education and Research 2014).

Girls and young women score higher grades than boys and young men in compulsory and upper secondary school. The difference in performance has remained the same from 2002 to 2012. Boys attain 90 percent of the

grades of girls, and girls score higher average points in all subjects except sports and health in compulsory school. In 2012–2013, young women scored higher grades in all national programs in upper secondary school, except the vehicle and transport program (Ministry of Education and Research 2014). In upper secondary schools, more women study in preparatory programs for higher education than men. Women also meet the basic requirements for university entry more than men (SNAHE 2008). More women (69%) than men (48%) plan to pursue higher education. The interest in attaining higher education is greatest among students in the natural science program (93%), and in this group, there is no difference between men and women. In vocational programs, more women (38%) than men (14%) plan to study further; thus, the difference between sexes is greatest among students in vocational programs (Statistics Sweden 2014b).

The major challenge facing the Swedish education system is ensuring that schools are equal to compensate for the different backgrounds and conditions of students. Currently, the gap between high-achieving schools and lower-achieving schools is growing. A second challenge is reaching equal gender representation in the teaching staff. Men constituted only 3.5 percent of full-time staff at preschools in 2012. In 2011–2012, 76 percent of compulsory school teachers were women, and 52 percent of upper secondary teachers were women (Ministry of Education and Research 2014).

Higher Education

Women have been entitled to study at university in Sweden since 1873. Sweden's first female doctor and gynecologist was Karolina Widerström (1856–1949) in 1888. In 1897, Elsa Eschelsson (1861–1911) became Sweden's first doctor of law and the north's first female university lecturer and professor, though it was not until 1927 that women had the right to attend high school (SNAHE 2008).

Since 1977, the proportion of women in higher education has grown as a result of reforms (SHEA 2014). The percentage of women and men in higher education have remained the same from 2002 to 2013: approximately 60 percent women and 40 percent men. Women have higher graduation rates. In 2012–2013, women constituted 63 percent and men 37 percent of students graduating (SHEA 2014). Just more than 1.2 million people in Sweden have higher education, and more than one in three Swedes have some form of postsecondary education (Statistics Sweden

2015). More women are highly educated among both Swedish and foreign-born persons.

Women dominate seven of the nine broad subject areas in universities, and they have made greater inroads into traditionally male-dominated areas. Men are predominant only in technology, and they have made fewer inroads into female-dominated areas. However, women and men continue to choose traditional education as before. For example, in university, women prefer social sciences and economics, while men prefer technology and natural science. Women are more often in nursing, preschool, and teacher training, while one in four men have an engineering education (Statistics Sweden 2014; SHEA 2014).

In the natural sciences, women make up 45 percent of the total proportion, 3 percent of the mathematics and computer science specialization, 70 percent of the environmental science, and 48 percent of natural science. Within the social sciences, women make up 64 percent of the total proportion, 56 percent of economics, 77 percent of cultural studies, 63 percent of social science, and 89 percent of languages (SNAHE 2008). The report suggests that the strong gender divisions in upper secondary schooling may be reflections of the traditional expectations associated with occupations in a gender-oriented labor market.

The proportion of women in doctoral programs has increased. In 2007, 49 percent of doctoral students were women. Between 2003 and 2013, the proportion of women at the doctoral level has varied between 47 percent and 50 percent. This number has risen from the 1990s, when half as many women as men were beginning doctoral programs. Doctoral studentships are more or less evenly distributed between men and women. Half of doctoral students awarded PhDs in 2013 were women, a number that has been steady during the past decade but risen significantly from 1990, when only 27 percent were women (SHEA 2014).

When it comes time to transition to the labor market, a higher proportion of men gained a footing in the labor market. Though it appears that men establish themselves better than women, the report argues that if one controls for choice in field of study, the proportions become less distinct between men and women (SHEA 2014).

At higher levels in the academic hierarchy, fewer professors are women. The number of professors who are women has risen 122 percent since 2003, though the proportion of women who are professors has only risen from 15 percent to 24 percent. More obvious increases in the percentage of women occurred among senior lecturers, rising from 30

percent to 45 percent since 2001. By 2030, it is estimated that 31 percent of professors will be women. The highest proportion of women (43%) is expected in the humanities and social sciences, while women professors will decline in the natural sciences to 5 percent (SHEA 2014).

Adult Education and Foreign-Born Residents

In the 2010 Education Act, every adult has the right to participate in basic adult education if the person lacks the skills normally attained in compulsory school and may benefit from the education. In 2011, 9 out of 10 participants in adult education had been born abroad. Every municipality is obliged to ensure Swedish-language education for immigrants. In 2012, 107,800 students attended Swedish for Immigrants (SFI) courses, of which 57 percent were women. Thirty-four percent of Swedish-language students had a university degree. Most were born outside Sweden, and their goal was to learn Swedish to enter Swedish society and work (Ministry of Education and Research 2014).

In the international survey of adult skills (PIAAC), of 23 countries, adults in Sweden have a good level of literacy, numeracy skills, and computer problem-solving skills, though women lag behind men (52% of women and 62% of men are good at numeracy, for example) (Statistics Sweden 2013a). Sweden thus has aimed to improve adult literacy by 2015, especially for women. However, while Sweden ranks well as a whole, a large share of the population (those with less education and many foreign-born persons) perform at a low level in the different knowledge areas. In particular, foreign-language immigrants in Sweden have low levels of literacy proficiency. Statistics Sweden warns that these individuals may have poor opportunities to take part in working life and society (Statistics Sweden 2013a; Ministry of Education and Research 2014).

Only 7 out of 10 foreign-born persons having higher education had work suited to their education as their main occupation, while the corresponding figure for Swedish-born persons was 9 out of 10. The figures are relatively even for foreign-born men and women. Those surveyed cited a lack of contacts, a non-Swedish name, foreign background, and language difficulties as important obstacles in obtaining jobs suited to their education (Statistics Sweden 2009).

Health

Sweden's health care system is regarded among the best in the world (OECD 2013). The average life expectancy

for women is 83.7 years and for men 80.1 years. A 2009 survey by the Equality Ombudsman indicated that certain individuals and groups do not have equal access to health and medical services. The most common grounds of discrimination were ethnicity and disability for both men and women. These are followed by sex and sexual orientation, with more women than men reporting discrimination. Other key issues facing Sweden today are care of its aging population and disparities in the health of its foreign-born residents.

Access to Health Care

Health care is universal for all Swedish residents. Guidelines are set by the national government, and responsibility for providing health care resides with the 21 regional governments and 290 municipalities. The health care system is primarily funded through general taxation. The system is also based on patient cost-sharing, or copayment. A primary care fee is USD\$15–\$30, while a specialist consultation varies from USD\$35 to USD\$49. The fee for a hospital stay is USD\$11 per day for the first 10 days and USD\$8 thereafter. Cost ceilings are kept low by limiting the amount a patient pays in a 12-month period. After patients pay USD\$130–\$150 for medical consultations and USD\$300 for prescription medication, the patient pays no more. There are 70 county council hospitals across the country, and specialized hospital and surgical care is distributed in 7 regional or university hospitals in 6 medical regions. Patients may also purchase medically necessary health care, and about 4 percent of the population has voluntary health insurance. The critical issue with Sweden's health care system is wait times. Today, municipalities must guarantee a specialist consultation within 90 days and elective treatment within 90 days of diagnosis, though in rural areas, these goals can fall short (Swedish Institute 2014b).

Maternal Health

Sweden ranked 3rd in Save the Children's 2014 Mother's Index and 5th in its 2015 index. This ranking is due to its low maternal mortality rates (a lifetime risk of maternal death of 1 in 13,600); its low under-5 mortality rate (3 per 1,000 live births); and the high socioeconomic status of women. Prenatal care and births are attended by midwives and have been since the 18th century. Doctors are called in when midwives perceive they are needed (Save the Children 2015). Caesarean rates are at 17 percent, and

emergency C-section rates are at 8.6 percent, some of the lowest in Europe (BBC 2015). Expectant mothers in Sweden receive prenatal care through free or subsidized courses to prepare for delivery. Women in strenuous jobs, such as work that requires heavy lifting, are entitled to take paid time off from work earlier during their pregnancy.

Breastfeeding rates are relatively high at birth (near 100 percent). At two months of age, 66 percent of mothers are exclusively breastfeeding, and at four months, 52 percent of mothers are exclusively breastfeeding. Higher-educated and overseas-born mothers breastfeed more during the first six months than do lower-educated and European-born mothers (Socialstyrelsen 2012).

Contraceptives are available to anyone in Sweden. Since 1974, women have been entitled to abortions before the 18th week of a pregnancy. Between weeks 12 and 18, a woman must discuss the abortion with a social worker. After week 18, an abortion will be performed only following a decision by the National Board of Health and Welfare and usually under exceptional circumstances. Abortion is subsidized by the government.

National Minorities and Foreign-Born Women

Health disparities for Sweden's minority women are very difficult to identify because Sweden does not compile official statistics regarding ethnicity. A 2010 report revealed that government agencies know very little about their specific needs, and much outreach misses Sweden's five national minorities. For example, Roma women experience higher stress associated with a higher workload at home. Pilot programs in several municipalities are training health communicators with Roma language skills and cultural competencies to work with Roma women and girls (CEDAW 2014).

A 2014 study found that total mortality for women decreased in Sweden from 1987 to 2007; however, mortality was higher among foreign-born women (particularly from low-income countries) than Swedish-born women (Esscher 2014). The suggested causes are manifold. The care-seeking behaviors of foreign-born women during pregnancy are reported to be different from Swedish-born women, including a later first appointment, fewer planned visits to antenatal care, and more unplanned visits to the labor ward. Other challenges include diseases that Swedish doctors and midwives may be less familiar with and language barriers that may prevent good health care without the assistance of an interpreter.

Tobacco Use

The proportion of smokers in Sweden has decreased between 1985 and 2012 for both men and women, from 28 percent of women in 1984 to 13 percent of women in 2012. For students in grade 9, smoking has shifted from 20 percent (1985), to 32 percent (2000), to 22 percent (2012) (WHO 2013).

Female Circumcision

Female circumcision (i.e., female genital mutilation or cutting (FGM/FGC)) has been illegal in Sweden since 1982, and if one is a resident of Sweden, it is also illegal to have the procedure done outside of the country. Women and girls are entitled to receive care if they have had the procedure done. Female circumcision rates have increased in Sweden, largely due to increases in immigration. Sweden estimates that, based on country of origin, approximately 38,000 women in Sweden had the procedure done before coming to Sweden. There are 19,000 women currently residing in Sweden who may be at risk for the procedure, based on the country of origin of their mother (Socialstyrelsen 2015b). In 2014, 60 cases of female circumcision were discovered in Sweden, 28 of them at the same elementary school (*The Independent* 2014).

Diseases and Disorders

In 2013, 71 percent of all deaths in Sweden occurred at age 75 years and older. The most common cause of death for both men (37%) and women (38%) is circulatory system diseases. Cancer (24%) is the next leading cause, and lung cancer is the most common among women and has increased since the 1980s. Prior to 2005, breast cancer was the leading cause of cancer-related deaths. Psychological diseases such as dementia are the third-leading cause of death (8%) (Socialstyrelsen 2015a).

Employment

The participation of women in Sweden's labor market did not differ markedly from other Organisation for Economic Co-Operation and Development (OECD) countries until the late 1950s. However, the development of an active labor market policy by the state and a powerful labor movement increased women's participation because it addressed structural constraints on women's employment (Ruggie 1984).

In 2014, Statistics Sweden published a report comparing 30 years of gender-based data (Statistics Sweden 2014f). In 2013, 83 percent of women and 89 percent of men, aged 20–64 years, were in the labor force. Seventy-seven percent of women were employed, and within that group, 54 percent were working full-time at least 35 hours, 20 percent were working part-time 20–34 hours, and 4 percent were working part-time 1–19 hours. Eighty-two percent of men were employed, and within that group, 75 percent worked full time at least 35 hours, 6 percent worked part-time 20–34 hours, and 2 percent worked part-time 1–19 hours. The employment rates for both men and women have decreased since 1987, though the proportion of women working full-time has increased since the beginning of the 2000s. Additionally, 30 percent of women worked part-time in 2013, a decrease from 45 percent in 1987. Younger women make up a larger proportion of part-time workers.

When participation in the labor market is broken down by region of birth, different numbers arise. In 2013, women born in Sweden participated in the labor market at a rate of 91 percent, while women born in other European countries participated at a rate of 84 percent. Women born in Asia participated at a rate of 69 percent, and women born in Africa at 63 percent. Men's numbers decrease substantially less when the numbers are broken down by region of birth.

Of those individuals not in the labor force, women make up 17 percent and men 11 percent. The main activities of women not in the labor force include studies (5%), illness (7%), housework (2%), job seekers (1%), and other (2%).

Paid and Unpaid Work

In 2012, women on average earned 86 percent of what men earned, a slight (3%) decrease in salary differences between men and women since 1994. When age, education, working hours, and occupational group are taken into account, women's pay is 93 percent of men's pay. These pay differences are largely due to differences in occupations between men and women, according to the report. In 2012, women had 66 percent of the pension amount of men, largely due to their greater extent of part-time work. Single women with children have the lowest disposable income. Cohabiting adults without children have the highest disposable income, followed by cohabiting adults with children (Statistics Sweden 2014f). The Discrimination Act requires that all employers carry out a pay survey every three years, and employers with at least 25 employees must

draw up an action plan for equal pay every three years (CEDAW 2014).

Women spent 3.5 hours on unpaid work, while men spent 2.5 hours in 2010. Since 1990, women have reduced their amount of time on unpaid work by 1 hour, and men have increased their time by 8 minutes (Statistics Sweden 2014f).

Occupation

The distribution of labor by sector differs for women and men, particularly in the private sector. In 2013, the proportion of women working for the municipality was 30 percent and 9 percent for men; for the county council, 9 percent for women and 3 percent for men; for central government, 7 percent for women and 6 percent for men; and in the private sector, 53 percent for women and 81 percent for men. Temporary employment has increased, and more women (57%) than men (43%) work in these kinds of positions, particularly in the public sector. Men make a substantially larger proportion of permanent employees in the private sector. The labor market is highly segregated by sex. In the top 30 occupations, an equal sex distribution is seen only in the occupations of chefs and cooks, doctors, and university and higher education teachers. Assistant nurses and hospital ward assistants are the occupations most dominated by women (Statistics Sweden 2014f).

Board and Management Positions

There are no laws regulating the gender composition of company boards or executives. In 2017, Sweden's parliament rejected legislation that would introduce a fine to listed companies who failed to appoint women to at least 40 percent of board seats. The legislation was proposed by the Social Democrats and rejected by the center-right opposition parties that control parliament (*The Guardian* 2017). This legislation was in line with an EU draft directive calling for the same requirements (Reuters 2014).

Women accounted for 49 percent of board members in state-owned companies in 2012, though chief operating officer (CEO) posts and management teams are dominated by men. Seventy-two percent of CEO posts and 62 percent of management team positions are held by men (CEDAW 2014). Women have yet to attain higher positions of power in the private sector. In private enterprise, the proportion of women on listed company boards was 16.1 percent in 2005 and 23.7 percent in 2013. The number of women who are board chairs and CEOs increased from 4.8 percent in

2005 to 6.1 percent in 2013. In Sweden's 62 large cap companies, 3 companies have female CEOs (5%) (Stoll 2014).

Family Leave and Parenthood

Sweden has provided parental leave benefits for the past 40 years. Parents are entitled to 480 days of family leave when a child is born or adopted, of which 60 days are reserved for each parent. Parents receive 80 percent of their normal pay to a maximum monthly income of approximately USD\$4500 for 390 of the days. The remaining 90 days are paid at a flat rate. Unemployed parents are also entitled to parental leave. Leave can be taken until a child turns eight, and the benefits apply to each child, allowing parents to accumulate leave from several children. Parents may also reduce their working hours by up to 25 percent until the child turns eight, though they are only paid for those hours they work (Swedish Institute 2014d).

Women continue to take more parental leave time. In 1985, women used 94 percent and men 6 percent of leave. In 2012, women used 75 percent, while men used 25 percent of leave (Statistics Sweden 2014f). Incentives have been introduced since the 1990s to encourage more men to take leaves. For example, parents can receive additional months of leave if the father takes a month of leave (*The Economist* 2014).

Family Life

Sweden's birth rate in 2011, 2012, and 2013 was 1.9 children per woman (World Bank 2014). In 2013, the average age for a first-time mother was 29 years old, and the average age for a first-time father was 31.5 years old.

Marriage and Family

The most common family form in Sweden is the nuclear family. Three of four children in Sweden lived with both their parents (biological or adopted) in 2011. As children get older, the nuclear family becomes less common because it is more likely their parents have separated. Nine of 10 1-year-olds live with both parents, while 6 of 10 17-year-olds live with both their original parents, a pattern that has been consistent for the decade prior to 2011. One-fifth of children live with a single parent, and 80 percent of them live with their mother (Statistics Sweden 2012).

In 2013, the majority of children were born outside of marriage. Sixty-three percent of first-born children in 2013 were born to parents who were not married to one

another. Children born in a marriage automatically have the husband or same-sex partner registered as their parent, while children born outside a marriage must have the father or same-sex partner registered. Four percent of all newborns in 2013 did not have a registered father. In 2013, one-quarter of newborns were born to a foreign-born mother (Statistics Sweden 2014a).

Children who live with a single parent often have poorer economic conditions than those with both parents living together. Single parents' disposable income is lower, and a larger part of their income comes from different government family support, such as child allowance and housing allowance. The average disposable income for a family with one adult and one child is about SEK 18,400 per month (approximately USD\$2300), and the average disposable income for a family with two adults and two children is SEK 43,000 per month (approximately USD\$5300) (Statistics Sweden 2014a).

In 2014, a new crime was introduced, coercion to marry. It applies to a person who induces another person to enter into marriage or a marriage-like relationship through coercion or exploitation of that person's vulnerable situation (CEDAW 2014). As of July 2014, it is no longer possible for children under the age of 18 to marry before a Swedish authority.

Same-Sex Marriages

Since 2009, Sweden has had a gender-neutral marriage law. Following the law's creation, 4,883 women have entered into same-sex marriages and 3,962 men as of 2013 (Statistics Sweden 2014d). This law was a continuation of a 1995 law that recognized same-sex domestic partnerships. In 1995, when domestic partnerships were legalized, more men (498) than women (167) joined in these partnerships. By 2003, more women than men were joining in same-sex partnerships, and more women than men have chosen to join in same-sex marriages.

Approximately 1,300 same-sex partners (married or domestic partnerships) are guardians of one or more children. Approximately 1,200 children have two women as guardians, while only 60 children have two men as guardians. In total, this number comprised about 1 percent of children in Sweden in 2011. Since 2005, women in same-sex partnerships may receive artificial insemination assistance from the Swedish health care system. The woman who is either "sambo" (living together), in a domestic partnership with, or married to the inseminated woman is

automatically registered as the parent of the child (Statistics Sweden 2013b).

Divorce

Sweden's divorce laws are based on a no-fault system where neither party must prove wrongdoing to obtain a divorce. Each year, approximately 20,000–25,000 divorces occur, a number consistent for the past 30 years. Marriages between two individuals born in Sweden lasted 13 years, between a Swedish-born and a foreign-born person 9.5 years, and between two foreign-born individuals 7 years (Statistics Sweden 2014e). Sweden has one of the highest divorce rates in the world, a rate that many researchers attribute to the welfare state that decreases dependency on a spouse's income and ensures a fairer distribution of wealth between classes (Spilde 2012).

Child Care

The Swedish government provides a monthly child allowance until a child reaches the age of 16. The allowance is SEK 1050 (approximately USD\$125) per month per child and is to be used for the cost of caring for the child (Swedish Institute 2014). If a parent needs to stay home with a sick child or a dependent, employees still receive 80 percent of their pay. The temporary parental leave is available for 120 days per child per year for children under 12 years of age. In 2014, women took 62.5 percent while men took 37.5 percent of total parental leave time to care for a sick child (Försäkringskassan 2015). Every year, women spend 7 working weeks more than men on cleaning, washing, and the care of dependents. After the birth of a first child, women begin to take sick leave from work at a rate about twice as high as men. This number persists over the next 15 years. The Ministry for Social Security is undertaking research to understand the causes underlying this disparity, in particular by looking at the double workload women take on as mothers and employees (Regeringskansliet 2014).

Adoption

Sweden has the highest per capita rate of international adoptions in the world, with 1 out of every 50 children being an adoptee. International adoptions are the most common, though international adoption rates have dropped since 2005 (Statistics Sweden 2014c). Any person over the age of 25, female or male, single or married, may adopt. Married

couples must adopt jointly, unless the spouse is living in an unknown place or suffering from a mental disturbance. In 2002, Sweden withdrew from the European Convention on the Adoption of Children, which it had ratified in 1968, to make changes to its national adoption laws to allow for adoption by homosexual couples in a domestic partnership. Russia recently stopped all adoptions to Sweden in protest of same-sex adoption rights and marriage (*The Local* 2013).

Politics

Women's representation in local and national legislatures has generally increased since the 1970s. In 2010, the National Parliament (*Riksdag*) distribution was 45 percent women and 55 percent men. In 1985, the distribution was 31 percent women and 69 percent men (Statistics Sweden 2014). In local legislatures, women total 43 percent of representatives. Though Sweden has no legislated quotas for its Parliament, several of the major parties have adopted quotas or other gender-related policies. The Social Democrats have alternated women and men on the party lists since 1993, while the Left Party and Green Party have had 50 percent quotas for women since 1987 and 1997, respectively (Quota Project 2015). Women still account for only 37 percent of Sweden's full-time politicians and 31 percent of the first names on ballot papers in municipal elections (CEDAW 2014).

The government consists of 24 ministers. During the 2010–2014 term, 13 ministers were women, and during the 2014–2018 term, 12 ministers were women. Female agency heads in central government now make up 46.5 percent. Members of boards and advisory councils appointed by government were 48 percent women, and 41 percent of chairs were women. Women accounted for 45 percent of permanent judges in general courts and 47 percent of permanent judges in the general administrative courts in 2013. At the municipal level, there are gender-stereotyped differences in the distribution of policy areas, with women overrepresenting child care and elderly care and men overrepresenting infrastructure, business, and tourism (CEDAW 2014).

Police and Armed Forces

Women represent 29 percent of the Swedish police force, a 10 percent increase over the past decade. The proportion of women working as chiefs of police has doubled to

25 percent during the past decade. In 2013, women represented 20 percent of applicants and admitted members to the Swedish Armed Forces. The Swedish government has asked the armed forces to increase the proportion of women at all levels. Sweden hosts the Nordic Center for Gender in Military Operations that works on the UN Security Council Resolution 1325 on women, peace, and security (Regeringskansliet 2014).

Feminist Initiative Political Party

Started in 2006, the Feminist Initiative, or Fi, has campaigned on a platform to keep gender equality questions on government agendas. The party is an outgrowth of the 1960s radical feminist network Grupp 8, which threatened in the 1990s to launch a feminist party if gender equality was not prioritized by established parties (Lundin 2014). Fi's current platform states they challenge the image of Sweden and Europe as the paradise of gender equality. This false image erases existing problems and stalls efforts for genuine change. During its first campaign in 2006, Fi received 0.68 percent of the national vote. Yet, remarkably by the 2014 elections, Fi narrowly missed a seat in the National Parliament with national support at 3.1 percent (short of the 4% needed for a seat in Parliament). It did secure a seat in the European Parliament, with 5.3 percent of the Swedish vote (Cowell-Meyers 2014).

Religious and Cultural Roles

The Church of Sweden was the official state church until 2000. It is Evangelical Lutheran, and Swedes became automatic members of the church at birth until 2000. Today, 66 percent of the Swedish population are members of the church, and that number is dropping 1 percent each year. Antje Jackelén, originally from Germany, became the first woman Archbishop of Uppsala, the chief representative of the Church of Sweden in 2014. The first women priests were inaugurated in the Church of Sweden in 1960, and today 45 percent of priests are women. When Sweden recognized same-sex marriage in 2009, the Church of Sweden began performing same-sex marriage ceremonies that year.

Only 8 percent of Swedes attend any religious service regularly, and approximately 1 percent of members of the Church of Sweden attend religious services. Twenty-nine percent of Swedes consider themselves religious. Other prominent religions are the Free Churches, Protestant

churches not affiliated with the state, which have a much higher attendance rate. There is a small Jewish community of approximately 20,000 people. Islam has grown with increasing immigration, and Sweden hosts five mosques (Swedish Institute 2014c).

Religious freedom and freedom from discrimination are protected by the constitution and other laws. Complaints about religious discrimination are filed with the Discrimination Ombudsman (DO), who will represent the individual in legal proceedings. In 2012, the DO received 82 complaints related to religion. The 2012 hate crime report to the police counted 310 anti-Islamic hate crimes. Most reported hate crimes that were anti-Islamic were either harassment against veiled women or hate speech (U.S. Department of State 2014). Hate crimes against sexual orientation have decreased during the past two years, but hate crimes with antireligious or Afrophobic motives have increased (UNAS 2013). Indictment rates for hate crimes are very low.

In 2013, a hate crime against a Muslim woman sparked an outcry from women in Sweden. An unknown assailant attacked the pregnant woman, tearing off her hijab, banging her head against a car, and shouting racist slurs at her. Women across Sweden, Muslim and non-Muslim, posted photos of themselves in head scarves using the hashtag #hijabuppropet (hijab outcry) (BBC 2013). The protest was criticized for exotifying Muslim women and reproducing the privileges of Sweden's white middle class, who simply took off the head scarves after a few hours (Yazdanfar 2013). Muslim women who wear head scarves are known to withstand the worst of racist attacks (Swedish Muslims in Cooperation Network 2013).

In the same year, a female Muslim reporter was not allowed to become the hostess of Sweden's public television program (SVT) *Mosaik* after she was initially offered the position. SVT's leadership argued that its policy was that all news should be impartial, and they considered a Muslim woman who wears a head scarf to breach that neutrality. The Swedish Muslims in Cooperation Network argues that this law is against the principles of religious freedom and the spirit of an inclusive multicultural society. Women have also been discriminated against when wearing the niqab. One woman was denied an education as a child minder because the school argued it needed to identify all personnel on school grounds, while three women were asked to leave a courtroom hearing for causing disruption (Swedish Muslims in Cooperation Network 2013).

Issues

Violence and Sexual Assault

Assaults against women have increased annually, from 22,000 in 2004 to 27,000 in 2013. Approximately 6,400 persons were suspected of abusing women in 2010, and 20 percent of the reports led to a suspect being tied to a crime. Eighty-five percent of those suspected of assaulting women are men (Brå 2014).

Reported rapes in Sweden have doubled over the past decade, due to both an actual increase in rapes and increases in reporting the crime. Changes in society, such as increasing introductions to strangers via the Internet, increased alcohol consumption, and more pubs and bars, are suspected of leading to more sexual assault. In addition, changes in legislation have led to more crimes being viewed as rape. In 2013, 6,000 rapes were reported, and the majority of victims were women. In 16 percent of offenses, a suspect was tied to the crime. The average prison sentence for rape was 2 years and 4 months, and for aggravated rape, 5 years and 10 months. Sweden's crime reporting agencies suspect that only 10–20 percent of all sexual offenses are reported to police (Brå 2014).

Honor killings are a growing issue in Sweden. It came to national awareness when Fadime Sahindal (1975–2002), a second-generation immigrant to Sweden who addressed Sweden's Parliament on her experiences as a Turkish and Kurdish woman, was killed by her father for dishonoring the family. Sahindal's father was sentenced to life in prison (Lyll 2002).

Trafficking and Prostitution

The purchase of sexual services has been illegal in Sweden since 1999, though the sale of sex is legal. This approach is part of Sweden's criminalization of buyers rather than prostitutes. The prohibition is supported by 70 percent of the population. The national inquiry on the criminalization of purchasing sexual services indicates that it has not negatively impacted individuals engaged in prostitution (CEDAW 2014), though other research indicates it has stigmatized prostitutes and increased discrimination. Since 1995, street prostitution has been cut in half, from 650 women to approximately 200–250 women in 2014. The decline may be due to the new law as well as the increasing use of the Internet for the sale and purchase of sexual services.

The majority of women engaged in the sale of sexual services are foreign nationals. From 2008 to 2011, the

number of purchases of sexual services reported to the police was 2,581, and the majority of sellers were women 18–25 years old. In 2011, penalties for purchasing sexual services were raised from imprisonment for 6 months to imprisonment for 1 year. Crimes committed abroad are also part of Swedish jurisdiction as long as they are also liable under the law where the act was committed. An exception is made if there is an absence of criminal law for sexual crimes against children (CEDAW 2014).

In 2012, the Swedish police drew up 21 reports on human trafficking for sexual purposes and 48 reports for nonsexual purposes. The victims were all women in human trafficking for sexual purposes, and 9 of them were children under 18 years of age. The National Police Board admits that it is difficult to estimate the number of trafficking victims (CEDAW 2014).

Foreign-Born Women

Sweden's Ministry of Integration wishes to bring foreign-born women into Swedish society more quickly. The Swedish government believes that it takes too long for newly arrived women to get into work, and too often they receive information about Swedish society from their partners. Rather than focusing on households, integration policies now focus on individuals to compel women to participate in initiatives such as civic orientation and employment preparation. Because of the parental benefit system, the government believes many newly arrived women with children take extended parental leave and do not participate in these initiatives. The government has also proposed that no more than 96 days of parental benefit should be payable after a child's fourth birthday (Regeringskansliet 2014).

Women who are born abroad have an employment rate of 54 percent, 8 percent lower than for men born abroad and 20 percent lower than for women born in Sweden. Sweden's 2010 Introduction Act attempts to promote gender equality for new immigrants through three changes. Individuals receive introduction benefits separately for participation in programs, allowing women to have an income of their own. Civic orientation is compulsory for all new arrivals, and women may choose a "pilot" as a link to society to help women have more than their husbands as links to Swedish society (CEDAW 2014).

The Swedish Secretariat for Gender Research argues that Sweden's "two-year rule" can lock women in violent relationships. The law dates to a 1983 Swedish Migration

Board decision to prevent fictitious marriages between a Swedish citizen and a person from another country. The rule states that if a couple gets divorced within two years, the spouse from the foreign country loses the right to reside in Sweden. The law forces women in “import marriages” to bear a heavier burden. Most import marriages involve a Swedish man and a woman from Southeast Asia, but they also can be found in immigrant groups where Swedish citizens meet their wives in their countries of origin. Inequality can be high in these marriages, particularly if one spouse arrives after the other, as when the man is established in Sweden and the woman is dependent on him.

Women in these relationships are more vulnerable to domestic violence, and they are overrepresented in women’s shelters and protection services. In 2013, 340 women reached out to shelters, while in 2014, the number increased dramatically to 1,197 women. A similar increase was seen in honor-related violence: 626 victims in 2013 and 1,128 in 2014 contacted a shelter for support. Organizers believe the increase is primarily due to outreach to these women. Most women endure abusive relationships for the two years until they receive their residence permits (Köljing 2015).

Sami Women

The Sami are both a recognized minority and indigenous people. Sami women have historically been marginalized by Swedish laws that have promoted the rights of men over women. Historically, women have been excluded from their communities after they marry or divorce, forcing them to lose land and decision-making rights. As a whole, Sweden has yet to remedy the discrimination it caused through its institutionalized discriminatory policies, nor has it ratified ILO Convention 169 on indigenous peoples. It has not acknowledged Sámi people’s rights to their historic lands, instead continuing to maintain that these lands belong to the state. Clear legislation for resolving historic land disputes, largely caused by discriminatory state legislation, have also not been designed (UNAS 2013).

Roma Women

Roma people are largely excluded from Swedish democratic processes, according to the UN Association of Sweden. Moreover, Roma individuals are reluctant to report discrimination due to distrust of authorities and a sense that their claims are not taken seriously. In an estimated

population of 50,000, unemployment rates are between 80 percent and 90 percent, and the vast majority have not completed elementary school. The requirement to teach in the Romani Chib language is often not met, and finding certified teachers is difficult. Roma people experience discrimination in housing, and they are often denied access to public space. When complaints of discrimination have been filed, few cases lead to results, and discrimination against Roma is also present in the legal system (CEDAW 2014).

Roma experiences are grounded in past discrimination. From 1935 to 1976, it is estimated that 60,000 Roma women underwent “voluntary” sterilization. Many women may not have understood the procedure being done to them. More recently, Swedish newspapers revealed that Swedish police authorities were keeping an illegal database of Romani people. This database included Soraya Post (1956–), an elected member of the European Parliament in 2014 for Sweden’s Feminist Initiative Party (Gardell 2013).

Disability

Around 26 percent of the Swedish population between the ages of 16 and 64 have some form of disability. Approximately 53 percent of them report that their disability limits their work capacity. Though the proportion of men and women having a disability is similar, more women than men report that it reduces their work capacity and increases their vulnerability to violence. Women with disabilities have higher levels of education than men with disabilities, though their paid work is lower and their finances poorer (CEDAW 2014). The FQ Forum Women and Disability in Sweden has argued that the disability movement in Sweden has ignored gender, while the women’s movement in Sweden has ignored disability. In particular, it is the lack of regulation concerning implementation of the laws and statutes pertaining to gender and disability discrimination that is at issue. Specifically, Sweden has yet to define inaccessibility as a form of discrimination (Forum—Women and Disability in Sweden 2011).

Citizenship

Swedish citizenship is based on affinity with Sweden and can be acquired at birth, through adoption and registration, and by application. Naturalization can be granted when the individual meets certain criteria, including age, good conduct, and habitual residence. Approximately 60 percent of foreign-born people residing in Sweden are

Swedish citizens. Under previously rules, children born abroad to unmarried Swedish fathers did not automatically become Swedish citizens and had to register for citizenship. Since 2014, a child who has one parent that is a Swedish citizen always acquires Swedish citizenship at birth (CEDAW 2014).

Switzerland

Overview of Country

Switzerland is a federal republic located in western Central Europe. It is a landlocked country bordered by Italy to the south, Germany to the north, France to the west, and Austria and Lichtenstein to the east. It is approximately 15,950 square miles (41,285 sq. km). The geography of Switzerland is primarily defined by the Swiss Alps to the south, meaning that most of the Swiss population resides on the Swiss Plateau to the north, where the country's largest cities of Zürich and Geneva are located. Another mountain range, the Jura Mountains, borders the west side of the plateau.

The Swiss climate varies greatly between the various geographic localities, with glacial conditions on mountain peaks and a temperate, Mediterranean climate at the southernmost part of the country. As of 2015, the population of Switzerland was 8,286,976 (World Bank 2016). According to the Swiss Federal Department of Foreign Affairs, since 1950, Switzerland has transitioned from a largely rural country to a mostly urban one, with nearly three-quarters of the country's population residing in urban areas. Since the beginning of the 21st century, the population growth in urban areas has been higher than in the countryside (FDFA 2016).

Located at the crossroads of three major European cultures (French, German, and Italian), Switzerland is a culturally diverse country. Nearly one-quarter of Switzerland's resident population are foreigners, with Italians making up the largest portion of this foreign community at 292,000 people. They are followed by the German, Portuguese, and French communities. Because of this rich

multiculturalism in Switzerland, the nation is multilingual. There are four language regions in Switzerland, each with their own official language: German, French, Italian, and Romansh. Many Swiss citizens speak several languages, making multilingualism an integral part of Switzerland's national identity (FDFA 2016).

The Old Swiss Confederacy, the precursor to the modern state of Switzerland, was established during the late medieval period. By 1648, the region of Switzerland gained independence from the Holy Roman Empire and was officially recognized as a sovereign territory in the signing of the Peace of Westphalia. This began Switzerland's long history of armed neutrality, as the nation has not been in a state of war internationally since 1815. The nation's interest in human welfare is typified by the International Committee of the Red Cross, a humanitarian institution that was founded in Switzerland in 1863 and continues to be headquartered there. According to the Geneva Conventions, the Red Cross has a mandate to protect victims of international and internal armed conflicts (ICRC 2016).

Economically, Switzerland is one of the most developed countries in the world. According to the International Monetary Fund (IMF), Switzerland has the highest nominal wealth per adult (IMF 2015). The nation has the eighth-highest capita gross domestic product (GDP), as in 2015, Switzerland's GDP was \$670,789,928 (World Bank 2016). Global rankings consistently place Switzerland as the wealthiest country in the world, and in 2013, the Credit Suisse Global Wealth Report named Switzerland as the country with the highest average wealth per adult. Credit Suisse also predicts that the Swiss economy will grow by 1.5 percent in 2017 (Credit Suisse 2017).

In 2015, the UN Development Programme (UNDP) ranked Switzerland 3rd out of 187 nations based on the Gender Inequality Index (GII; 0.028). However, despite the nation's history of economic prosperity and cultural diversity, Switzerland's gender roles and values were slow to evolve. Switzerland was the last Western republic to grant women the right to vote, as women's suffrage was not achieved at the federal level there until 1971. Once suffrage was achieved, however, women quickly gained political representation and social equality, with the nation electing their first female president, Ruth Dreifuss, in 1999.

Girls and Teens

In Switzerland, children up to age 14 make up only 15.1 percent of the total population. Girls make up less than half

of children in this age group, with only 7.2 percent of the Swiss population consisting of girls aged 14 and younger (IndexMundi 2016). Education rates for this young female segment of the Swiss population are quite high, as there is a nearly 100 percent participation rate among girls in pre-primary and primary school education (UNICEF 2013). As a result, opportunities for young Swiss girls and teens are relatively high, while gender bias among this demographic is relatively low.

Sex Education

In Switzerland, the content and amount of sex education is decided on the state rather than the federal level. In some cases, sex education has focused on girls first rather than boys. In Geneva, for example, courses have been given at the secondary level first for girls since 1926. However, overall, sex education in Switzerland is not gender specific. Since the 1970s, generalized sex education courses have been implemented by the states with trained specialists within school health services at the secondary level.

In the 1980s, sex education began to be implemented in primary schools in Switzerland as early as kindergarten. The objectives of this introductory education have been to empower children, strengthen their resources, and give them the capacity to determine what is right or wrong based on what is and is not allowed legally and socially. In 2014, a concerned parents group in Switzerland expressed outrage when they learned that their kindergarten-aged children had been given genital plush toys to play with as part of their sex education curriculum. This began an effort on the part of the conservative Swiss People's Party to outlaw sex education in Switzerland for children under the age of nine (Clark-Flory 2014).

Health

Switzerland is known for its high life expectancy rates and general health and well-being of all citizens, which means the country's health care system has often been used as a model for other developed nations. In Switzerland, health care is universal and required of all citizens. The government does not provide health services; instead, Swiss private insurers are required to offer coverage to all citizens, regardless of medical history or age. In turn, Swiss citizens are obligated to buy health insurance. With an infant mortality rate of only 3 deaths per 1,000 live births and a maternal mortality rate of 6 deaths per 10,000 live births,

Switzerland is among the healthiest nations in the world (WHO 2017). This can largely be contributed to the high standards of the Swiss health care system.

Swiss women are generally healthier than Swiss men, as the life expectancy is 74 years of age for women and 71 for men (WEF 2017). Swiss men are more likely to be physically active, with 76 percent of men surveyed by the Swiss FSO in 2012 reporting they engaged in some form of exercise compared to only 69 percent of women. Swiss women, however, are more likely to focus on diet as a means of health and wellness, with 75 percent of women surveyed in 2012 reporting that they pay attention to their diets compared to 60 percent of men. Men are also more likely to experience obesity in Switzerland, with 50 percent of men surveyed reporting that they were overweight compared to only 32 percent of women (FSO 2016).

Reproductive Health

Women in Switzerland have equal access to the nation's health care facilities. Contraceptives are easily available in Switzerland, and statistics indicate that over 80 percent of Swiss women use some form of birth control (World Trade Press 2011). Abortions are legal in Switzerland when performed within the first 12 weeks of pregnancy. In general, the Swiss government supports sexual and reproductive health and rights, primarily through its partnership with the Federal Office of Public Health and the International Planned Parenthood Federation (IPPF). These offices structurally and strategically support sexual and reproductive health professionals in Switzerland, promote free access to independent and high-quality information and services for sexual and reproductive health to all Swiss citizens, and advocate for sexual and reproductive health and rights in the political and public context. IPPF often works in alliance with nongovernmental organizations (NGOs) and other professional organizations in Switzerland to promote sexual and reproductive health and rights for Swiss citizens, and it is currently working to provide a network of professionals in sexual and reproductive health and rights in Switzerland while also actively participating in the international community on these issues (IPPF 2016).

Education

Education in Switzerland is diverse in its forms and structures because Switzerland's Constitution grants authority for the school system to the nation's individual cantons,

or member states. Furthermore, Switzerland's cultural diversity contributes to the diversity of its education system, where there are many private international boarding schools containing students from all over the world. There are both public and private schools in Switzerland, where primary school is obligatory for all children, and free education in public schools is guaranteed by the Swiss Constitution.

Education in Switzerland consists of early childhood education (preschool, kindergarten); basic education (primary, lower secondary, upper secondary education); and higher education (colleges and universities). The Swiss higher education system has a large focus on sciences and international relations, as there are several prestigious institutions in Switzerland devoted to these two realms of study, including the Graduate Institute of International Development Studies. Many Nobel Prize laureates have been Swiss scientists, including Albert Einstein and Richard Ernst. While Switzerland as a nation excels in these two fields of study, women are statistically underrepresented in both the sciences and international studies (FSO 2016).

In general, the gender gap between men and women in the Swiss educational system is quite pronounced. The World Economic Forum (WEF) ranks Switzerland 61st out of 144 nations in the category of educational attainment opportunities for women (WEF 2017). According to the Swiss Federal Statistical Office (FSO), in 2015, the percentage of Swiss women aged 25–64 without postcompulsory education was higher than that of Swiss men of the same age. This difference is particularly pronounced at the college or university level. However, the Swiss government has been working to narrow this gender education gap. Between the academic years of 1995–1996 and 2003–2004, the proportion of female students attending postsecondary education programs in Switzerland rose by 1.5 percent. This was on par with other Western European countries, where the range of increase was between 1.3 percent and 2.2 percent (UNICEF 2008). In 2015, there was significant progress for the younger generation of Swiss females. In the 25–34 age group during this year, the proportion of women with a university degree was higher than that of men of the same age (FSO 2016).

Study Choices

Education choices—and, subsequently, career choices—have historically been quite gender specific in Switzerland.

Into the 21st century, this gender division has remained largely unchanged, although over the past two decades, this division has become slightly less rigid. Overall, young Swiss men are more likely than women to pursue technical fields of study, such as engineering, architecture, information technology (IT), and the sciences. In 2014, just 6 percent of Swiss students in their first year of diploma training courses in the fields of engineering and computer sciences were women. Young Swiss women, on the other hand, are overrepresented in vocational fields of study, such as health, the humanities, social work, and teacher training. In degree programs for health and social services, women made up 90 percent of the students in these fields in 2014 (FSO 2016).

However, these gender barriers are beginning to break down in Switzerland's educational system. Young Swiss women today are more likely than in the past to choose traditionally male-dominated fields of study. Since 2000, the proportion of Swiss women has risen in all university faculties as well as in the traditionally male-dominated areas of study at this educational level. However, this flexibility has not extended to traditionally female-dominated fields. Today, young Swiss men are just as unlikely as in decades past to choose educational programs where women have been historically overrepresented, including health, teaching, and social work. In 2015, 71 percent of university students admitted to humanities and social sciences degree programs were women. By contrast, women made up only 31 percent of students beginning degree programs in the technical sciences (FSO 2016).

Teaching

Although there is a relatively balanced ratio between the total numbers of male and female students in the educational system in Switzerland, this ratio becomes skewed at the graduate level. Comparatively fewer women than men graduate from higher education in Switzerland (UNICEF 2008). This gender imbalance is also represented among teachers in Switzerland. While virtually all teachers at the preschool level in Switzerland are women, the higher the school level, the smaller the percentage of female teaching staff (FSO 2016). At the secondary school level, Switzerland has a low proportion of women teachers compared with other Western European countries. At the graduate level, this gender gap is even more pronounced, as there are a significantly lower proportion of female lecturers

than men in Switzerland's graduate institutes. However, this division is beginning to shift. In recent years, the number of female lecturers in graduate education has risen significantly (FSO 2016).

Family Life

Although Switzerland is one of the most developed nations in the world economically and politically and contains one of the healthiest populations of any nation on the planet, Switzerland remains a relatively male-dominated society. Only about two-thirds of Swiss women actively participate in the country's economy, as many women focus instead on their domestic lives. This is largely due to long-standing, traditional views on Swiss women's role in society. This role can be summarized by the common description of Swiss women's work as revolving around *kinder, kirche, und kuche* (children, church, and kitchen). This widespread perception of Swiss women and their role in society can be seen as an invisible yet powerful barrier preventing women from gaining professional, economic, and social equality in Switzerland.

Marriage and Childbearing

In Switzerland, women generally enter into marriage and family life much earlier than their male counterparts. According to the WEF, in 2016, the proportion of women married by the age of 25 was three times higher than that of men. According to this same report, the mean age of women at the birth of their first child was 32 (WEF 2017).

Switzerland is unique among other European countries in that, although a minimal maternity insurance was implemented in 2005, there is currently no statutory parental or paternity leave. Statistics show that the bulk of the burden of child-rearing is borne by Swiss women, who on average take 98 days of maternity leave (WEF 2017). However, there is an increasingly common phenomenon of Swiss fathers taking paternity leave to care for their child for at least 30 days. In many cases, these men take unpaid paternal leave, in agreement with their employer. In other cases, Swiss men will leave their jobs to take paternity leave and then benefit from unemployment insurance while caring for their children. These studies show that, for Swiss men, taking leave usually comes at a price, which may explain why it is a relatively rare phenomenon in Switzerland (Valarino 2016).

Household Roles and Responsibilities

Because it is increasingly rare in Switzerland for a single salary to meet the financial needs of a family, it is often a financial necessity for both parents to seek paid employment outside of the household. Although Swiss mothers are increasingly engaged in paid employment, it continues to hold true that most of them work part-time. This is particularly true for households where children are living at home; in these cases, the work and time percentage for mothers is under 50 percent. In many cases, Swiss women give up their jobs altogether when children live in the household (FSO 2016). Swiss fathers, on the other hand, usually work full-time, indicating that the burden of balancing work and family life in Swiss society is typically borne by women.

The most typical model for Swiss family households with children is for the father to be employed full-time and the mother part-time, with the second most frequently chosen model being the father in full-time employment and the mother economically inactive. However, this trend has shifted. Since 1992, the share of Swiss family households with the father in full-time employment and the mother economically inactive declined sharply in favor of the model where fathers work full-time and mothers work part-time (FSO 2016). This trend can be interpreted to show that gender roles in family life in Switzerland are beginning to shift, with the delegation of paid and unpaid work becoming more evenly distributed among the sexes.

Politics

Legal advancements toward gender equality are a relatively recent phenomenon in Switzerland, with women only gaining suffrage at the federal level in 1971. While women have equal rights according to the letter of the law in Switzerland, Swiss women nevertheless experience social restriction at many levels. In general, Switzerland is a relatively socially conservative nation on gender issues.

Switzerland is the world leader in direct democracy, as all citizens can directly decide on a broad range of policies. However, studies have found that there are large gender gaps in citizen voting on referendums and initiatives. These gender gaps are particularly pronounced in the areas of health, environmental protection, defense spending, and welfare policy. Swiss women show consistently higher approval rates for allocating funds to environmental protection than men and are less supportive of nuclear energy.

Swiss women are more in favor of equal rights for men and women and generally support the disabled, but they are against the military (Funk and Gathmann 2015). Ultimately, these studies have shown that Swiss women prefer quite different sociopolitical policies than Swiss men.

Legal Rights

Switzerland was one of the last European nations to give its women the right to vote. Consequently, although Swiss women enjoy the same rights as men under Switzerland's Constitution, gender discrimination and social barriers for women remain prevalent. Feminist movements in Switzerland throughout the late 20th and early 21st centuries led to a large increase in women taking up various previously inaccessible professions. Because of these movements, the Swiss government also implemented several laws promoting gender equality and established a Federal Office for Gender Equality in 1988. In 1996, the Swiss Federal Act on Gender Equality entered into force, which specifically prohibits gender discrimination in paid employment. These federal initiatives have sought to create more work opportunities for Swiss women in the mainstream economy and have seen incremental success. Although social trends for the treatment of women have yet to see substantial change because of these laws, an increasing number of Swiss women are participating in public life.

LGBTQ Rights

LGBTQ rights legislation in Switzerland is relatively liberal, paralleling the general legal situation for LGBTQ citizens in Europe and the Western World. Same-sex sexual activity has been legal in Switzerland since 1942. There has been legal recognition for same-sex relationships in the country since 2007. In 1993, a legal procedure for the registration of gender reassignments following gender reassignment surgery was outlined. Since 2012, Swiss authorities have generally allowed legal gender reassignments without the evidence or requirement of surgery. Swiss citizens generally support LGBTQ rights, with a 2016 poll showing that 69 percent of the Swiss population supported same-sex marriage.

Participation in Government

In Swiss politics, women make up only 26 percent of the National Council and 24 percent of the Council of States. In only 6 out of the last 50 years has there been a female

head of state in Switzerland, making the female-to-male ratio in this area only 14 percent. However, this ratio is relatively high compared to global statistics; Switzerland is ranked in the top third of nations worldwide for its representation of women in heads of state roles (WEF 2017). As many nations have yet to elect a female head of state, Switzerland stands as somewhat progressive in this arena, as the nation elected its first female president in 1999. In 2016, the WEF ranked Switzerland 15th out of 144 nations in its *Global Gender Gap Report* in the area of female political empowerment (WEF 2017).

Considering that Swiss women only gained the right to vote in 1971, the nation has made relatively large strides in the participation of Swiss women in policy making. The representation of women in the Swiss Federal Assembly has grown from 5 percent in 1971 to 30 percent since 2011 (Funk and Gathmann 2015).

Divorce and Child Custody

Swiss women have the right to initiate divorce and claim custody of their children in the divorce process. They also have equal rights to the joint property of the couple in divorce. In the case of cohabitation without marriage, if parents separate, the mother is legally considered the custodian of her children in Switzerland, even if paternity is proven. In all divorce cases, however, the Swiss court decides the legal guardian of children.

Feminist Organizations

Switzerland is home to many organizations devoted to the economic, political, and social advancement of women. These organizations have made great strides over the last century toward women's equality both in Switzerland and abroad. One of the largest and most far-reaching of these organizations in Switzerland is the Women's International League for Peace and Freedom (WILPF), which was founded in 1915 in Geneva. Today, the WILPF is an international NGO with National Sections for countries on every continent, an international headquarters in Geneva, and a New York office devoted to the work of the United Nations. WILPF is devoted to working within existing legal and political frameworks to achieve structural change in the way nation-states understand and address issues of gender, but also militarism, peace, and security. WILPF was one of the first organizations to gain consultative status with the United Nations, and it is the only women's antiwar

organization so recognized. In 2015, WILPF adopted several new congress resolutions in addition to its core aims, including a resolution on the human right to health and safe food, a resolution on girl soldiers, and a resolution that seeking asylum is a human right (WILPF 2016). Over its 100-year history, WILPF has made great strides toward gender equality and the advancement of human rights around the world.

The other major women's group in Switzerland is the International Council of Women (ICW), which was the first truly global women's NGO; it was founded in 1888 for the advancement of women nationally as well as globally. Since that time, the ICW has worked to promote international women's rights through the United Nations and other global organizations. The primary concerns of the ICW are international peace and justice, capacity building for women as decision makers, and women's human rights. The ICW empowers women through projects designed to help women in the areas of literacy, nutrition, developing leadership skills, food safety, income-generating projects, and more (ICW 2016). Much like the international work of Swiss-based organizations like the Red Cross, feminist organizations in Switzerland have worked to promote women's rights and equal human rights both at home and around the world.

Employment

Women continue to experience limitations on work opportunities in Switzerland. Studies show that, overall, Swiss women earn 28 percent less than their male counterparts for performing the same job. For women aged 45 and above, this disparity is even larger, at 35 percent. Gender-based wage disparities are widespread in Switzerland and are more pronounced in the private than in the public sector (Anastasiade, Catalina, and Tille 2016). According to the WEF, Switzerland ranks 43rd out of 144 nations in wage equality for similar work (WEF 2017). Studies have found that the gender wage gap in Switzerland is more pronounced in jobs that earn lower wages, with the wage gap in these jobs over proportionally due to gender discrimination. Economists have pointed to the lower education among women in these positions as attributing to the large discrimination component at low wages (Bonjour and Gerfin 2001).

Women make up 46 percent of Switzerland's labor force. In 2015, economic growth was widespread across

Switzerland, with the number of economically active persons in the country increasing by 1.7 percent over the previous year. This growth was more pronounced for women, who showed a 1.9 percent increase compared to the 1.5 percent increase among the male population (FSO 2016). However, the gender gap among professional and technical workers in Switzerland remains high. The WEF ranked Switzerland 79th out of 144 countries for the economic participation and opportunity available to women in these fields (WEF 2017).

Professional Workforce

Opportunities for women professionally and socially remain limited in Switzerland. Swiss women continue to be delegated to traditionally female professions. In the medical field, for example, a high percentage of nurses are women as opposed to men. Swiss women continue to take up jobs that have historically been identified as "women's work," including baking, confectionery, teaching, secretarial work, and jobs in the service sector. In rural areas of Switzerland, gender discrimination is even more pronounced. Swiss women in rural areas have access to even fewer job opportunities and mainly work on farms. However, the percentage of self-employed female farmers in Switzerland is only 3 percent (World Trade Press 2011).

Although Switzerland has one of the most developed and competitive economies in the world, Swiss women continue to face barriers in the employment sector. The percentage of Swiss women in leadership roles is quite low, with only 3 percent of upper-management positions in Switzerland belonging to women. Eighteen percent of Switzerland's women work as middle-level employees, even though 44 percent of university graduates in Switzerland are women. According to the FSO, Swiss women are more likely to be underemployed than men. Underemployed persons are those who are partially employed but wish to work more. In 2015, there were 2.5 times more underemployed women than men in Switzerland (FSO 2016).

Unpaid Work

In Switzerland, women spend significantly more time on unpaid work than men. Unpaid work is defined as productive activities that are necessary for the functioning of society, but they have no remuneration. This includes domestic and family work, such as housework and caring

for children and elderly family members. According to the FSO, in 2013, Swiss women spent on average 30 hours per week on unpaid work, while Swiss men spent less than 20 hours per week on unpaid work. This gender division is particularly pronounced among families with children aged 6 years old and younger. Among this demographic, Swiss women spend an average of 55 hours per week on unpaid work, while men spend only 25 hours (FSO 2016).

Issues

Domestic Violence

In Switzerland, men are more likely than women to appear in police statistics for violent crime, both on the side of the aggrieved party and on the side of the accused. Swiss men are more likely to be victims of violence in the public sphere, while women are much more likely to suffer from domestic violence. Domestic violence is widespread in Switzerland, with about one in eight of all Swiss women experiencing physical and sexual abuse (World Trade Press 2011). Swiss government officials note that these figures likely do not reveal the real extent of the issue in Swiss culture, as many cases of domestic violence go unreported (FSO 2016).

Since Swiss women's movements of the 1970s raised the topic of violence against women, distinct changes in social perception and responses to the problem can be noted. Before that time, the issue was generally addressed in the context of gender inequality and seen as a reflection of discrimination and oppression of women. Aid for female victims of domestic violence was generally focused on bolstering the victim's empowerment and agency and attempting to widen their opportunities for action and change.

However, the introduction of the federal Victim Assistance Act in 1993 marked a broader recognition of the issue of violence against women, which had up until that point been the work primarily of women-centered NGOs and services. From the mid-1990s onward, the Swiss government placed increasing support behind women's support services and victim assistance agencies through the formation of Gender Equality Offices. Furthermore, since 2000, changes in legal frameworks have been initiated to address the problem of violence in relationships, both heterosexual and homosexual. These include making violence in marriage and relationships a public offense and protection measures against domestic violence under civil law (Liebig, Gottschall, and Sauer 2016).

Sexual Harassment in the Workplace

The law in Switzerland prohibits sexual harassment and provides legal remedies for those claiming discrimination or harassment in the workplace. However, the U.S. Department of State reports that special legal protection against the dismissal of Swiss citizens making such claims was only temporary (U.S. Department of State, Bureau of Democracy, Human Rights and Labor 2015).

One of the first and only studies of the prevalence of sexual harassment in the Swiss workforce was undertaken in 2008 by the Federal Gender Equality Office and the State Secretariat for Economic Affairs. This study found that sexual harassment was quite prevalent in the Swiss workplace, with nearly half of all Swiss workers reporting encountering some type of sexual harassment over the course of their working lives. In two-thirds of these cases, women were the targets of the harassment. By far, the most common type of harassment behavior cited by women was degrading or obscene jokes and comments (Swiss Info 2008). Thus, although the Swiss Constitution outlaws sexual harassment, it nevertheless continues to be an issue for Swiss women in the workplace.

T

Turkey

Overview of Country

The Republic of Turkey is located at the crossroads of Europe and Asia. Istanbul, the country's cultural and economic capital, is a transcontinental city that stretches over the Bosphorus Strait, connecting Turkish lands in South-eastern Europe to its West Asian territories (also named Anatolia). With a total area of 302,535 square miles, Turkey's shores reach from the Black Sea to the Mediterranean and the Aegean Sea. The country has borders with Bulgaria and Greece in the west; Georgia, Armenia, and Iran in the east; and Iraq and Syria in the south.

The last official census from 2014 puts Turkey's population at 77.695.904, with a 1.21 percent yearly growth rate. This census also registered 99.8 percent of the population as Muslim. Although no exact numbers are available on the subject, the ethnic distribution of population is estimated to be around 75 percent ethnic Turks, 18 percent ethnic Kurds, and around 7 percent other minorities (CIA 2015). With a nominal gross domestic product (GDP) estimate of USD\$798,429 million, Turkey is the 18th-largest economy in the world and among the upper income level countries (World Bank 2014).

Turkey's unique geostrategic position, which renders it a bridge between Asia and Europe, played a decisive role in shaping its history and culture. The lands of the modern

Republic of Turkey have hosted some of the most vibrant cultures and powerful empires in world history, including but not limited to ancient Greek colonies, the Persians, the Roman Empire, and the Ottoman Empire. South European, Mediterranean, and West Asian civilizations met and melted into a unique amalgam in Anatolia, which to this day informs many aspects of Turkish culture, from architecture, to family life, to cuisine and politics.

The Republic of Turkey, established in 1923, is one of the several successor states built on the remains of the multiethnic, multireligious Ottoman Empire (1299–1922). Mustafa Kemal Atatürk (1881–1938) was the founder and the first president of the Turkish Republic. Atatürk launched a full-thrust secularization and westernization program that revolutionized not only the country's political institutions but also its cultural and social structures. The Kemalist reforms of 1920s and 1930s gave women political rights, created modern educational and employment opportunities for them, and, finally, introduced a secular civil code that lifted many restrictions on women's legal rights in marriage and inheritance.

Unfortunately, Turkish women have not been able to capitalize on these early gains. Republican-era reforms had been masterminded and implemented by male bureaucrats and politicians, who saw these arrangements as mere “window dressings” necessary for the image of a “modern nation” rather than a genuine and legitimate social need. Moreover, the Turkish military's stronghold on civil affairs

and their regular interventions in political life created an unfavorable environment for the democratic institutions to strike a strong root in Turkey. As the country struggled to institutionalize democratic values in the face of frequent military interventions, political freedoms and minority rights, including those of women, non-Muslims, and ethnic minorities, suffered major setbacks. To this day, there is a significant gap in Turkey between the institutional reforms enacted by lawmakers, however promising they appear on paper, and the cultural mind-set of those who are in position to uphold and apply the law. This discrepancy is at the root of many problems Turkish women face today.

The World Economic Forum (WEF) 2015 Gender Gap Index lists Turkey 130th out of 145 countries, with a score of 0.624 (0 = inequality, 1 = equality), and the 2015 Human Development Index (HDI) puts Turkey in the Group 4 category, which includes countries with low to medium equality in HDI achievements between women and men (UNDP 2015).

In the early 2000s, Turkey has made major headway toward democratization and gender equality. The main incentive behind these developments was the fact that, in 2004, the European Union agreed to initiate the EU accession process for Turkey. As part of the harmonization efforts with the EU *acquis communautaire*, the Turkish Parliament passed a series of laws to improve the human rights record of the country and to eliminate discrimination and violence against women. A constitutional amendment in 2004 placed the responsibility for establishing gender equality on government: "Men and women have equal rights. The State shall have the obligation to ensure that this equality exists in practice" (Article 10).

As a step toward meeting the EU criteria, the government created a parliamentary task force, Equal Opportunities Commission, responsible for promoting gender equality in legislation and in public life. Another important development was the drafting of the *National Action Plan: Gender Equality 2008–2013*, a comprehensive policy document on gender equality. This five-year action plan was prepared and promoted by the General Directorate on the Status of Women, an office under the prime minister, and it laid out detailed policy suggestions for reforming education, politics, health care, and the economic structure of the country, with the goal of eliminating discrimination against women and advancing their social and economic standing.

The implementation of these policy suggestions, however, proved to be difficult. The current governing party, the

Justice and Development Party (JDP), has been in power in Turkey since 2002. In its early years, JDP achieved unprecedented levels of public support thanks to its promises of demilitarizing politics and creating a progressive and democratic constitution. After emerging victorious from the 2007 elections, however, the leaders of the party gradually began to turn their backs on their democratization and reform promises. Finally, a corruption scandal that broke out in 2012 and implicated the current president, Recep Tayyip Erdogan, and other important members of the JDP triggered a strong authoritarian streak in the government and a major reversal for the democratization process of the country. Over the last three years, the JDP-controlled government forces have systematically been eliminating all kinds of opposition and criticism directed at the party and at President Erdogan. The worrisome trend of suppression of freedom of speech, free press, and free judiciary has been noted in the 2015 Human Rights Watch report on Turkey, which exposed the rapid erosion of human rights in the country, including a disappointing rollback in women's rights reforms (HRW 2015).

The issues facing Turkish women today have deep roots in the authoritarian and patriarchal social and political structures still prominent in Turkey. Lower educational levels compared to men, low participation in the economic and political life of the country, child marriages, disputes on the reproductive rights of women, domestic violence, and impunity for violence toward women can be listed among these issues. Most recently, the increasingly sexist and misogynist discourse of some of the leading politicians has been compounding the already existing structural challenges and encouraging impunity toward physical and psychological violence against women.

The Kurdish women in Turkey have additional barriers to overcome. The armed conflict between the Turkish government and the separatist Kurdish militants, which has claimed more than 30,000 lives since the early 1980s, put women of Kurdish ethnic origin at a particularly precarious position, as the mistrust toward the government and security forces make it virtually impossible for them to take advantage of the educational and other social services provided by the government.

Finally, the Syrian refugee crisis that brought more than 2 million refugees from across the border into Turkey created new problems and concerns about the health, education, employment, and general well-being of the refugee girls and women. The prevalence of child marriages among the refugee girls and human trafficking are of

particular concern to human rights activists working with refugee families.

Girls and Teens

Education and Literacy

In Turkey, primary education has been mandatory and free for both sexes since the earliest years of the Republican regime. Up until the last decade, however, low enrollment and attendance rates for girls remained a major problem, most specifically in rural Anatolia. In 2003, the government launched a campaign, which was also supported by several private companies and nongovernmental organizations (NGOs), to raise public awareness of girls' education. The Let's Go to School, Girls! (*Haydi Kizlar Okula*) campaign targeted 10 east Anatolian cities with the lowest primary school enrollment rates for girls. The campaign was extended to all cities and towns in the country in 2006. Largely thanks to this effort, Turkey has almost reached the goal of eliminating gender inequality in primary education enrollment (United Nations 2010). In 2015, girls' enrollment rates reached 90 percent for primary schools and close to 80 percent for middle and high schools. Similarly, Turkey has achieved gender equality in literacy among youth, with 99 percent literacy rate for both boys and girls ages 15–24 (World Bank 2014).

Family Roles

Turkey is a highly urbanized country with a rapidly modernizing society; as a result, family structure and traditional gender roles are also in the process of transformation. This transformation is particularly visible in urban areas where acceptable gender behavior diverges significantly from those in rural parts of the country. A similar difference in attitudes toward this issue can be observed among various socioeconomic strata. Urban populations and families from upper socioeconomic classes tend to be more liberal when it comes to girls' and women's daily lives and work and educational opportunities, whereas in rural Anatolia and in families with lower educational levels, women and girls find it more difficult to break free from their traditional gender roles.

Both in urban and rural communities, however, family life continues to have strong patriarchal tones. In Turkish culture, men are seen as the main breadwinners and providers in the family, while women's key role is homemaker, even when they hold full-time jobs. Working women are

still largely responsible for the care of the children and for chores around the home, while men rarely get involved in housework and child care. Girls' role in the family is to help their mothers with chores; they are often expected to learn cooking and cleaning at a young age and to help their mothers to keep a clean and orderly household.

Another traditional value that continues to play an important role in Turkish culture is "family honor." This very broad and vague conceptualization of honor puts undue and excessive pressure on women and girls, especially in rural areas. Teenage girls in smaller communities often find their social lives closely monitored by the male members of the family and the community, and any action that might be deemed damaging to "family honor," however vaguely defined, could produce fatal consequences.

Marriage Age and "Girl Brides"

"Girl brides," or underage girls forced into marriage by their families, is a social reality that the Turkish society grapples with. In 2004, the government introduced a number of amendments to the civil and criminal codes to combat this problem. The new regulations raised the minimum age for marriage from 15 to 17 for both men and women. They also forbid forced marriages and, in such cases, gave women the right to request an annulment within the first five years of marriage.

Despite the stipulations of the law and political and religious leaders' public condemnation of it, underage and forced marriages are still common in rural Turkey. According to official numbers from 2001, 32 percent of all women married that year were under the age of 19. While statistics indicate a significant drop of 10 percent in that figure in 2015, official records are not exactly reliable on this subject. Underage and forced marriages of girls often take place as religious marriages, neither registered nor recognized by the government. Not only do these marriages put girls at a higher risk of mental and physical health problems, they also deprive them of their legal rights as wives that they would have acquired in an officially recognized, legal marriage (Republic of Turkey Prime Ministry General Directorate on the Status of Women 2008).

With the recent influx of Syrian refugees into Turkey, the child marriage crisis has reached a new climax. In 2014, the United Nations High Commissioner for Refugees (UNHCR) expressed concern that Syrian refugee girls in Turkey are forced into marriage as early as at the age of 13. Many families cite their dire economic conditions as

the main reason behind marrying off their daughters so early. Turkish media has also exposed a few cases where refugee girls were sold off by their families to much older men (Cubukcu 2014).

These developments raised a new awareness in Turkey about child marriages. The No to Child Brides platform, an umbrella organization that brings together some 50 civil society organizations and volunteer groups, actively works toward ending child marriage in Turkey (UNFPA 2012). Most recently, the Turkish film director Deniz Ergüven brought the subject to the attention of the international community with *Mustang*, a movie about five teenage sisters who are forced into marriage in rural Turkey. *Mustang* was nominated for best foreign language film at the 2015 Academy Awards.

Education

The origins of educational reform for women in Turkey go back to the mid-19th century. As part of a larger societal modernization project, the Ottoman government established the first modern middle schools for girls in 1853. Soon enough, the need for female teachers for girls' schools opened up the door to a new professional career for women: teaching. By 1900, more than 2,000 women were employed in public and private schools in all major provincial centers of the Ottoman Empire. By 1923, thousands of girls had graduated from modern middle and high schools, a few even obtaining college degrees, just in time to assume an active role in the creation of the secular Turkish Republic. Republican governments further enhanced educational opportunities for women by making primary education mandatory and free and encouraging women to pursue higher education.

Public schools are government-subsidized and free in Turkey, and only a small portion of Turkey's sizable student population takes advantage of private educational institutions. According to 2015 numbers, out of the total student body of 17,559,989 (kindergarten through college), only 1,102,000 students attend private schools (TUIK 2015).

Turkey has a highly centralized educational system that leaves no autonomy to local administrations and schools. All key aspects of education—curricula, funding, school placements, and so on—are strictly regulated by central government agencies. The strong bureaucratic grip on education, which pays very little attention to regional, cultural, and socioeconomic differences in the country, is a challenge to educators and students alike.

A symptom of this problem is noted in the 2013 Organisation for Economic Co-Operation and Development (OECD) report on Turkey, which reveals that the rate of underperforming students in Turkey is well above the OECD average and that “academic achievement is particularly low amongst disadvantaged students from low socio-economic backgrounds” (OECD 2013). In addition to deepening the existing socioeconomic inequalities, Turkey's tightly regulated educational system is also seen by many critics as a major propaganda outlet for the official ideology that promotes ethnic nationalist and patriarchal values, with no regard for diversity and respect for ethnic and religious minorities and for women.

Another major problem of the Turkish educational system is the regional imbalance in the quality of education. While the economically advanced western provinces boost elite schools and the best teachers, the public schools and a handful private institutions located in eastern Anatolia are more than often underfunded and understaffed, offering very little in the way of quality education to their pupils.

With its rugged terrain, inhospitable climate, and troubled political history, eastern Anatolia remains Turkey's least-developed region. Home to the largest concentration of Kurdish population in the country, these lands have withstood the worst of the armed conflict that has been going on between the Turkish government and the Kurdish secessionist guerillas since the early 1980s. The ideological rift and the resulting war put the Kurdish girls seeking education at an especially disadvantaged position. Caught between oppressive cultural structures, economic underdevelopment, and mistrust and hostility toward government institutions, they are much less likely to be able to take advantage of the educational opportunities provided by the government. So, for example, while the western Anatolian city of Bilecik boasts an impressive 84 percent enrollment rate for girls in secondary education, the eastern Anatolian town of Mus, a city with a very large Kurdish population, has a middle school enrollment rate of only 15.9 percent for girls (TUIK 2015).

Literacy Rate

Turkish government aims to achieve a 100 percent literacy rate for both men and women. In 2008, they launched the Mother and Daughter to School campaign to reach out to illiterate women, especially targeting those who live in rural areas and women from lower socioeconomic backgrounds. Additionally, several volunteer groups and NGOs

offer free literacy classes for girls and women in both the urban and rural parts of the country. According to 2015 estimates, the adult literacy rate in Turkey is 94.9 percent, with 91 percent for women and 98 percent for men (CIA 2017).

Primary and Secondary Education

Until the late 1990s, mandatory primary education in Turkey was five years. In 1997, the number of years in compulsory education was raised to eight—basically making middle school obligatory, too. Finally, in 2012, the government created the “4+4+4 model,” integrating primary and secondary schooling into a twelve-year mandatory system. These developments have vastly improved girls’ chances of receiving secondary education. Official statistics for the 2014–2015 school years indicate a significant rise in middle school and high school enrollment rates for girls, with an impressive 94.3 percent for the former and 79.26 percent for the latter (TUIK 2015).

However, enrollment does not necessarily guarantee attendance. For example, UNICEF statistics show that while the secondary school net enrollment ratio for girls was 80.4 percent that year, the net attendance ratio was only 43 percent (UNICEF 2013). The educational agencies in the country clearly need to analyze and understand the underlying reasons behind this high dropout rate among girls and develop policies to address the issue.

Higher Education and Women in Academia

Turkey has a rapidly expanding net of institutions of higher education. According to 2015 numbers, there are 114 public and 76 private colleges in Turkey, mostly concentrated in central and western Anatolian towns. In fact, some 40 percent of all Turkish colleges and universities are located in the three largest cities of the country: Istanbul, Ankara, and Izmir (TUIK 2015). The Turkish government subsidizes university education, and students at public institutions pay only a nominal amount in tuition and fees.

As is the case with primary and secondary education in Turkey, university education is highly centralized and under strict government control. The Council for Higher Education (CHE), created in 1981 by the military regime that overthrew a civil government in 1980, continues to have sweeping authority on both public and private colleges and universities, leaving very little autonomy to university boards and administrators. The CHE’s tight grip on

the content and structure of higher education in Turkey has long been seen as the main obstacle to the improvement of the quality of college education and scientific research in the country.

Moreover, the college admission procedure, which is extremely competitive and strictly regulated by the CHE, is very problematic. Once a year, the CHE holds a nationwide university entrance exam. Students who fail to take the test that day or achieve high scores on it have to wait another year to take it again. Many pupils spend several years preparing for the entrance exam, and their families find it necessary to invest a considerable amount of money in private tutors and preparatory classes to ensure university placement for their children. Even though public colleges are free, the prohibitive cost of college preparation puts people from the lower socioeconomic strata at a decisively disadvantaged position from the beginning. Those from better-off families, on the other hand, are more likely to secure higher scores and placement at top universities, which, in turn, has a profound impact on their economic success later in life. According to 2011 OECD numbers, the investments Turkish families make for university entrance exams pay off, as people with a college diploma can expect to earn 56 percent or more than those with no college degrees. (The OECD average was 40% in 2011.) Similarly, the unemployment rate for people with higher education is lower than the rate for those without one (OECD 2013).

In terms of access to higher education, Turkey is on its way to closing the gender gap. In 2014, 45.8 percent of all students enrolled in college were female. The country has also made important strides toward reaching a more balanced share of women and men in traditionally male-dominated fields, such as science and engineering. For example, in 2010, 49 percent of PhD degrees in math, computing, and science and 39 percent of PhD degrees in engineering, manufacturing, and construction were granted to women. Women seem to be successfully represented in other academic fields as well: 41 percent of all academic staff in Turkey are women. However, this rate drops significantly when we look at the top of the academic hierarchy. For example, only 28.1 percent of all full professors in Turkey are women. The glass ceiling effect exacerbates further up the ladder. In 2010, a mere 5.5 percent of heads of institutions of higher education were female. The European Commission’s 2012 report on Gender in Research and Innovation describes this phenomenon as a “leaky pipeline,” where “the more advance along the academic ladder, the less women we find” (European Commission 2012).

Women academicians in Turkey are working toward overcoming this gap. In 2013, and again in 2014, they organized two nationwide meetings to address the issue of lack of female leadership in academia. In these meetings, they set up an agenda to overcome the structural challenges in front of women and to foster cooperation among them.

While those who make it into academia struggle to break the glass ceiling, others have higher barriers on their path. As in the case of primary and secondary education, women from higher socioeconomic strata and urban women are better positioned to take advantage of college education, whereas women from lower-income families and those who live in rural areas are much less likely to attend an institution of higher education. Thanks to the dominant perceptions about women's gender roles as well as the need for the income from girls' labor, if these families ever decide to make the substantial monetary investment for college preparation, they are more likely to do so for their sons rather than their daughters.

Health

Turkey's 2008 National Action Plan for gender equality has a special section on women's health that declares: "Ensuring that women benefit from health services fully, equally and at the highest quality possible is a prerequisite for the achievement of women's human rights." While key indicators of the quality and accessibility of health care in Turkey reveal that there is still much room for improvement (Turkey's health care spending both in terms of the share allocated from the GDP and per person expenditure is well below OECD standards), over the last decade, the Turkish government has made great strides toward modernizing the health care system in general and family medicine in particular. As a result, between 2002 and 2011, there has been a significant decrease in neonatal mortality, maternal mortality, and infant mortality rates in Turkey. Additionally, the life expectancy at birth increased from 74 for women and 69 for men in 2007 to 78.5 for women and 72 for men in 2015 (UNDP 2015).

This success can largely be attributed to the Health Transformation Program (HTP) launched by the Turkish government in 2003. The HTP overhauled all key aspects of the health care system in the country. Among the noteworthy achievements of the HTP are the expansion of health insurance to a larger portion of the population, substantial improvements in the accessibility of quality health care, and the creation of a family physician system with a

particular focus on maternal and child health care. Additionally, the number and quality of hospitals and other health care infrastructure in the country have improved noticeably since 2003 (OECD 2014).

While these efforts have been praised by the World Health Organization (WHO) and OECD, there are a number of concerns expressed in regard to women's health in Turkey. First, the quality of health care offered to women beyond maternal care is questionable. For example, in 2011, only 15 percent of women ages 20–69 were screened for cervical cancer, and the percentage of women ages 50–59 screened for breast cancer remained at about one-third of the OECD average (OECD 2014).

Rapidly rising obesity rates present another serious health problem for Turkish women. According to 2014 numbers, 24.5 percent of women are obese, and 29.3 percent are overweight. These women are more likely to suffer from high blood pressure, diabetes, and high cholesterol. A WHO report indicates that mortality from coronary heart disease among Turkish women is the highest in Europe (WHO 2016). Despite the pervasive nature of this problem, family physicians often fail to discuss with and educate women about the potential health risks caused by unhealthy dietary habits.

Another disconcerting issue in regard to women's health is the rapidly rising rate of caesarean deliveries in the country. As of 2015, Turkey has the highest C-section rate among the OECD countries and is only the third in the world after Brazil and China. Over the last decade, the number of C-sections increased some 63 percent, reaching 462 per 1,000 live births (OECD 2014). A culture of C-section seems to have emerged among pregnant women and health care providers in Turkey. Unaware of the potential risks for themselves and for their babies and the cost for the health care system, many women prefer to have a C-section as an "easy and painless" alternative to natural delivery. Recent surveys also reveal that doctors similarly prefer C-section as a "less risky" method of birth and encourage their patients to go through this operation (Tiras 2015).

Maternity and Infant Welfare

As noted in the introduction of this section, the maternal and infant mortality rates in Turkey have been dropping significantly over the last decade. Increased access to prenatal and postnatal care is the main factor behind this: according to WHO statistics, 91 percent of all births

in the country were attended by skilled health personnel. The same year, 74 percent of new mothers received antenatal care (four or more doctor visits after delivery) (WHO 2016). However, the discrepancy between urban and rural areas remains a problem, with rural Turkey having twice as high maternity and infant death rates than the urban areas. The National Action Plan of 2008 points to early marriages, short intervals between pregnancies, poverty, and lack of education among the leading causes of maternal and infant deaths in Turkey (Republic of Turkey Prime Ministry General Directorate on the Status of Women 2008).

Fertility Rate, Reproductive Rights, and Abortion

Greater access to education, new work opportunities for women, and changing economic and cultural structures tend to delay the age for first marriage for women. As a result, the fertility rate in Turkey has gradually been declining over the last three decades, dropping from 4.33 in 1978, to 2.65 in 1993, and finally reaching 2.1 in 2014. It is important to note, however, that this number shows regional variety. For example, while the mostly rural eastern Anatolia has a fertility rate of 4.0, the more developed western Anatolian towns have an average fertility rate of less than 2.0. Educational levels play a similar role to that of regional differences: for women with no formal education, the fertility rate stands at 3.76, whereas for women with high school or higher degrees, it is 1.66 (Republic of Turkey Prime Ministry General Directorate on the Status of Women 2008).

Since the early 1960s, the Turkish government has been playing an active role in promoting family planning. Publicly funded birth control campaigns were organized to educate women, especially in rural areas, about birth control methods and to provide free access to contraceptives. The 2003 National Action Plan for gender equality encourages family planning and notes, “The decline in the total fertility rate will bring about an improvement in the health indicators of women in the coming years.” However, as in several other areas concerning women’s social status and empowerment, recent political developments in Turkey have been detrimental to women’s freedom of choice in this matter. Turkey’s current president, Tayyip Erdogan, and members of the governing party are ardent opponents of birth control. Erdogan himself declared birth control as a form of “treason” and has been publicly pushing the doctrine of “at least three children for every Turkish family.”

The backlash from women’s organizations only caused him to harshen his tone on the subject (CIA 2017).

Abortion is another topic of passionate ideological debate between the politicians and women’s rights activists in Turkey. The Turkish Constitution gives women the right to terminate a pregnancy, with the condition that married women should get the consent of their husbands. However, President Erdogan and other leaders of the JDP have openly condemned abortion, publicly admonished women who seek it, and equated the termination of a pregnancy with an act of terror. As a byproduct of the current political atmosphere in Turkey, increasingly more health care providers find it necessary to comply with the personal beliefs of the politicians. In February 2015, a women’s rights organization in Istanbul called 37 public hospitals and asked whether they performed abortions. Only 3 of these hospitals replied positively, and 17 reported they would terminate a pregnancy only if it presented a clear danger to the mother’s health. Another 12 hospitals refused to carry out an abortion under any circumstances (Letsch 2015). In short, while the Turkish law allows abortion, the *de facto* reality is that women seeking one have extremely limited options.

Family Life

During the rapid industrialization and urbanization process of Turkey in the 1950s, the nuclear family has become the norm in the country. With the declining fertility rates, the size of the nuclear family has been shrinking as well. Yet, extended family still carries cultural weight. Maintaining strong ties with relatives and respect for the elders of the family are very important in Turkish culture. Extended families provide social security networks in times of need for family members, especially for the elderly.

Marriage Law

Under the leadership of Ataturk, the Republican regime created a secular civil code in 1926. Among other things, this code outlawed polygamy and religious marriage contracts and established a secular legal basis for women’s rights in marriage. It remained in effect without any significant change until 2004.

In 2004, as part of the reform package to meet the criteria of the EU *acquis communautaire*, the 1926 Civil Code underwent a major revision. For example, while the earlier version named the husband as the head of the household,

the new code redefined family as a union “based on the equality between spouses” (Article 41). The same revision also gave women equal rights to property acquired during marriage, whereas husbands previously had exclusive rights to property they obtained during marriage (Articles 202–211). This last revision was particularly welcomed by women’s rights activists for recognizing women’s contributions to the family economy as homemakers. Additional changes to the Civil Code and the Penal Code in 2004 and 2005 raised the minimum age for marriage, criminalized marital rape, and harshened sentences for domestic violence and honor killings.

LGBT Rights and Marriage

As a Muslim majority country, there is a strong cultural taboo against homosexuality in Turkey. While the law does not criminalize same-sex unions and LGBT activism, neither does it recognize same-sex marriage. There is no legislation against discrimination based on sexual orientation, and anecdotal evidence provided by the members of the LGBT community indicates widespread hostility and discrimination against them. In a Pew survey in 2007, 57 percent of the participants from Turkey said that same-sex relations were not socially acceptable. Most recently, a survey conducted by IPSOS, a French market research company, in 2015, indicates that only 27 percent of the Turkish people believe same-sex marriages should be allowed by law (IPSOS 2015).

Military service is compulsory for all Turkish men between the ages of 18 and 40. On the other hand, military law defines same-sex sexual activity as a crime. The Turkish military requires homosexual conscripts to “prove” their sexual orientation through a medical examination. The Turkish army identifies homosexuality as an illness, upon which the men are declared “unfit for military service” and exempted from the draft.

Issues

Low Participation in the Labor Force

One of the main handicaps of the Turkish economy today is the low number of women in the labor force. In the 2015 Global Gender Gap Index, Turkey ranked 131st out of 145 countries with a female labor force participation rate of 32 percent, well below all other OECD countries and many other developing nations worldwide. To complicate the issue further, government statistics from 2014 indicate

that almost half of these women work in the informal economy, that is, they are not registered as employed with the government. These women typically work in the agricultural sector or, in urban settings, as domestic workers, cooks, food vendors, seamstresses, and the like. Many are unpaid workers in small family businesses (TUIK 2014). Women who work in the informal economy are at a decidedly disadvantaged position, as they are paid lower wages; have no access to health insurance, social security, and other labor rights; and are not represented in labor unions. Finally, 24 percent of all women in the Turkish workforce are employed part-time (CIA 2017).

The 2008 National Action Plan for gender equality cites structural challenges such low education levels and comparatively lower wages for women, migration to urban areas, and marriage and traditional responsibilities of women in the family as the main reasons behind the low female participation in the labor force. Workforce participation levels increase for women with higher education, and the rate of single women in the workforce is higher than that of the married women. Similarly, labor force participation is lower in urban areas than the countryside, where women often labor as unpaid workers on family farms and ranches (Republic of Turkey Prime Ministry General Directorate on the Status of Women 2008).

For those who work in the nonagricultural sector of the formal economy, the glass ceiling effect is a challenge. According to 2015 Global Gender Gap Index, only 13 percent of all legislators, senior officials, and managers in Turkey are women. The same index rated Turkish women’s ability to rise to positions of leadership at 3.5, with 1 being the worst and 7 the best.

Recent statistics also indicate that one out of every five women in Turkey is on the verge of poverty. To help women in poverty and to encourage a larger number of them to join the formal labor economy, the Turkish government developed a number of strategies that include, but are not limited to, the expansion of affordable child care services and cash support to families in need of child care and for the care of the disabled and elderly. The Turkish government also allows up to 112 days of paid maternity leave for new mothers.

Additionally, the General Directorate of Social Assistance and Solidarity, a government office, provides financial support and microcredit opportunities for women. Finally, the Turkey Grameen Microfinance Program—a collaboration between the Grameen Trust of the Nobel Peace Prize Laureate Muhammad Yunus and the Turkish

Foundation—created a microcredit program for low-income Turkish women in 2003. In 2012, they initiated the Women Empowerment in Economy Project, which, in addition to microcredit opportunities, also provides training opportunities and an e-commerce platform for women who wish to start their own businesses. One of the partners of the project, Turkcell, one of the largest communications companies in Turkey, reports that, since 2012, they have helped 55,000 women in Turkey with credit and training opportunities (UN Economic and Social Council 2012).

Violence against Women and Impunity

Violence against women and impunity toward it is one of the major social problems in Turkey. Despite the fact that, after 2004, the Turkish Parliament passed a series of very important laws to prevent domestic violence and other forms of violence toward women, the justice system and the police force fail to enforce the law (Senol and Yildiz 2013).

Domestic violence is common and socially acceptable in Turkey. An official survey conducted by the General Directorate of Women's Affairs in 2009 found that about 40 percent of all married women in Turkey have been victims of domestic violence at least once during their marriage. The same year, 953 women were murdered by the members of their families. In a more troubling trend, a study conducted by a women's and children's rights advocacy group in 2013 found that 38 percent of the male participants believed some behaviors of women make it necessary and acceptable to use violence against them (Senol and Yildiz 2013).

Two important revisions of the Turkish Penal Code in 2004 and 2012 harshened the sentences for the perpetrators of domestic violence and honor killings. In 2012, Turkey also became one of the first countries to sign the Istanbul Convention on Preventing Violence against Women. The same year, the government passed the Law to Protect Family and Prevent Violence against Women. This law legislated the building of a protective network for women and children, which would encompass preventive measures against violence as well as the creation of women's shelters and other infrastructure for providing psychological and legal assistance to the victims of violence.

While there is no official data on the extent and success of the implementation of this law, reports by women's rights organizations and anecdotal evidence provided by women who seek the services within the purview of the law indicates lack of infrastructure, low quality of services,

and police impunity toward domestic violence. Victims of domestic violence report that police often fail to take women's complaints seriously. Law enforcement officers and prosecutors encourage women to forego complaints, seeing domestic violence as a private family matter that should be dealt with in the family. As a result, they fail to detain and bring charges against abusive family members. Reports of women being murdered by their abusive husbands after their requests for protection were turned down by the police are widespread in Turkey (Johnson 2014; HRW 2015). In one specific case, in 2009, the European Court of Human Rights found Turkey guilty of failing to protect a victim of domestic violence from her abusive husband, who had previously murdered the victim's mother but was later released (European Court of Human Rights 2016).

The media coverage of violence against women is similarly troubling. An academic study from 2000 on women's representation in Turkish popular culture revealed that TV shows and newspapers tend to sensationalize violence against women, sometimes "embellishing" the stories with scandalous and pornographic details and often articulating legitimizing excuses for the perpetrators of the violence (Republic of Turkey Prime Ministry General Directorate on the Status of Women 2008). In a widely publicized case in 2014, for instance, a man who was charged with and served time for murdering his two previous wives was allowed to take the stage on a popular dating show to declare that he was "looking for love again."

U

Ukraine

Overview of Country

Ukraine is a country in Eastern Europe that borders Poland, Slovakia, Hungary, Romania, Moldova, Belarus, Russia, and the Black Sea. Its land area covers 233,000 square miles (about 604,000 sq. km), making it one of the largest countries in Europe. Ukrainian is the official state language of Ukraine; however, Russian is the language most commonly used in Ukraine's eastern and southern cities, where it has a protected legal status.

Once known as the “breadbasket of Europe” for its fertile farmland, Ukraine remains one of the world's leading exporters of grain. Today, however, agriculture employs only 10–20 percent of the population. Most Ukrainians live in cities (67.8% of the population) and work in non-agricultural economic sectors, in particular, small trade, services, education, state administration, and manufacturing (State Institute for the Development of the Family and Youth of Ukraine 2014, 55).

Ukraine became independent in 1991 after seceding from the Soviet Union. It is divided into 26 provinces, called *oblasts*, and one autonomous region, Crimea (a contested territory that was invaded and annexed by Russia in 2014). The country traces its origins back to the medieval state of Kievan Rus', whose lands were later colonized by the Russian and Austrian Empires. After World War I, when these

empires were dissolved, Ukraine declared independence. Despite five years of armed struggle, referred to as the Ukrainian War of Independence (1917–1921), the territories of Ukraine were conquered and partitioned among neighboring states. The Soviet Union claimed most of present-day Ukraine at that time, establishing the Ukrainian Soviet Socialist Republic (Ukrainian SSR). Western Ukraine (formerly governed by the Austrian Empire) came under the rule of Poland, Hungary, Romania, and Czechoslovakia, but it was annexed by the Soviet state and merged with the Ukrainian SSR in 1939. Histories of rule under different imperial and state systems are believed to have produced strong regional differences in values and beliefs among Ukrainians who live in the western provinces (referred to as Westerners or Western Ukrainians), as opposed to Ukrainians who live in the central, southern, and eastern provinces (referred to as Easterners or Eastern Ukrainians).

The population of Ukraine has been declining steadily for the past two decades. In 2014, it was estimated by state sources to be 45 million, down from 51 million at its peak in 1989 (State Statistics Service of Ukraine 2014). This decline is believed to result from several factors. First, the birth rate in Ukraine, already very low for decades, dropped in the 1990s from two to one births per woman, where it has remained (United Nations Development Group 2010, 36). Second, due to repeated wars, several famines, high rates of environmental and industrial accidents, the poor quality of medical services

and other factors, such as alcohol abuse, the rate of mortality among Ukrainians—in particular among men—has been high in the past and increased in recent decades (United Nations Development Group 2010, 36). Third, widespread economic problems in Ukraine (where the current poverty rate is 25%) and perceptions that economic opportunities are better abroad have led many Ukrainians to migrate to other countries since the country's independence (CIA 2017; United Nations Development Group 2010, 20).

Since independence, the proportion of citizens of Ukraine who identify Ukrainian as their ethnicity has gone up. It increased from 72.7 percent of the total population in 1989 to 77.8 percent in 2001. The share of the population that identified as ethnic Russian declined from 22.1 percent in 1989 to 17.3 in 2001. The percentage of the population that identifies with some ethnicity has remained stable at 5 percent of the population (CIA 2017; State Statistics Service of Ukraine 2001). In 2017, a sociological study found that the proportion of Ukrainians who identify as ethnic Ukrainians has increased to 90 percent (Ukrayinska Pravda 2017). This gradual shift in the national composition of Ukraine results from several demographic processes: ethnic Ukrainians returning from other former Soviet republics following the proclamation of independence; out-migration by ethnic Russians to Russia and other countries; growth in Ukrainian national consciousness among people who might once have considered themselves Russian by nationality; and higher birth rates in Western Ukraine and in small towns and rural areas, where very few Russians live.

Ukraine is located along the border of Roman Catholic, Eastern Orthodox, and Muslim spheres of influence and has been enriched by the resulting religious diversity. In the past, most Ukrainians were Eastern Orthodox Christians. However, Uniates (Greek Catholics), Jews, and Roman Catholics constituted sizeable minorities, particularly in the western, central, and southwestern provinces of Ukraine. Communities of Muslims and Protestants have also lived for many decades in Ukraine. Many believers of all faiths were forced into exile or underground in the Soviet era, when organized religion was largely prohibited, and believers and clergy faced severe persecution (notably, the entire population of Crimean Tatars was forcibly expelled after World War II and prohibited from returning). Since independence, a religious revival has taken place. Nevertheless, according to recent polls, today more than two-thirds of Ukrainians do not identify with

any religious confession and roughly a quarter identify as Orthodox Christians. The rest consider themselves Greek Catholic (5.3%), Protestant (0.9%), Muslim (0.2%), or Jewish (0.1%) (Razumkov Center 2014).

Overview of Women's Lives

Before achieving independence, Ukraine was governed by the Soviet Union for many decades. The Soviet state promoted equal education and high employment for women and made investments in comprehensive child care, maternal health care, and other services that advanced the status of women. But Soviet rule also brought about major challenges that negatively affect the lives of women today.

The Soviet experience created an enduring culture of corruption and mistrust of the state that continues to undermine efforts to democratize and build effective state, market, and social institutions. The Soviet state carried out campaigns dismantling the resources through which women develop the capacity to utilize their educational capital and occupational opportunities. Women's groups and other civic associations that could have acted to represent women's interests were disbanded. Most forms of organized religion were banned or placed under direct state control. Land and many other forms of private property were seized by the state. Millions of lives were lost during forced migration and mass expulsions of hundreds of thousands of people who had been declared enemies of the state (Perkovsky and Pirozhkov 2015, 149). There were famines caused by state seizure of land, grain, and crops in the early 1930s as well as purges and other state actions (Graziosi et al. 2013; Perkovsky and Pirozhkov 2015, 149). These losses have led to a demographic asymmetry: women have constituted the majority of Ukrainians for much of the last century and currently make up 54 percent of the population (State Institute for the Development of the Family and Youth of Ukraine 2014, 7).

Since Ukraine achieved independence, advocates of women's rights have attempted to secure the commitment of the leaders of the country to address gender issues. Their activity has resulted in a number of progressive laws and state policies that define equality in education, health care, employment, and social benefits as universal entitlements of citizenship. Women advocates have also promoted progressive reforms in the system of family and child welfare.

Women's advocates successfully lobbied for the Constitution of Ukraine to recognize the right of women and men to equality before the law (Hrycak 2001, 141).

They also created further legal bases for gender equality through prohibitions on discrimination based on gender that were added to in the Family Code, the Criminal Code, and the Labor Code; the Compulsory State Maternity and Bereavement Insurance Act (2001); and the Equal Rights and Opportunities Act (2005) (Hrycak 2010; State Institute for the Development of the Family and Youth of Ukraine 2014; United Nations Development Program 2003). The Prevention of Domestic Violence Act (2001) and other policies have been passed to prevent violence against women (State Institute for the Development of the Family and Youth of Ukraine 2014).

Women's advocates considered these legal reforms a major step toward providing women and men with equal social, economic, political, and personal rights and freedoms (United Nations Development Program 2003). The Constitution and the Equal Rights Act define numerous mechanisms through which equal rights are to be safeguarded: (1) by offering women the same opportunities as men in social, political, and cultural activities; in education and vocational training; and in work and remuneration for work; (2) by implementing special measures to protect women's work and health; (3) by providing pension benefits; (4) by creating the conditions to enable women to combine work with motherhood; and (5) by furnishing legal protection and material and moral support for mothers and children, including paid leave and other benefits for pregnant women and mothers (State Institute for the Development of the Family and Youth of Ukraine 2014).

While these laws and policies are consistent with the guidelines set and recommendations made by international women's rights bodies, implementation of these measures has remained elusive. Women are underrepresented in the judicial, executive, and legislative branches, even though they constitute a numerical majority of the staff of these institutions (State Institute for the Development of the Family and Youth of Ukraine 2014, 43). They also face systematic discrimination in the labor market (State Institute for the Development of the Family and Youth of Ukraine 2014, 61). Despite the existence of policies and laws intended to promote gender equality, women are rarely able to use them to defend their rights. Furthermore, while women's organizations have undertaken a wide range of projects that could be valuable to women facing discrimination or violence, these efforts are not able to sustain themselves, mainly due to insufficient local funding.

Education

Literacy

Before the 20th century, most Ukrainian women were illiterate, but literacy rates varied considerably by region. In areas of Ukraine that were under Russian rule, in 1897, only 4 percent of Ukrainian women were literate (compared to 23% of men) (Kubijovyc 1993, 135). By contrast, in territories of Western Ukraine that were under Austrian rule, in 1880, 10 percent of Ukrainian women were literate (compared to 17% of Ukrainian men) (Kubijovyc 1993, 136).

Literacy rates among Ukrainian women rose steadily in the 20th century (Kubijovyc 1993, 136). Literacy increased first in Western Ukraine, which benefited from the introduction in the 1870s of mandatory primary schooling by the Austrian state. Among Western Ukrainian women, literacy reached 44 percent in 1920 and 56 percent in 1931. In territories that were under the rule of the Russian Empire, literacy remained very low due to bans on the use of the Ukrainian language in schooling and in print. Literacy among Ukrainian women increased steadily, reaching 33 percent by 1926, 72 percent in 1939, and nearly 100 percent by the late 1980s.

Literacy in Ukraine is nearly universal today, with rates of 99.5 percent among males and females aged 15 or older in 2001 and at 99.9 percent for children under 15.

Opportunities

The Ukrainian Constitution defines education as a fundamental right guaranteed to all Ukrainian citizens. Primary and secondary schooling are compulsory and free. University and postgraduate education are free on a competitive basis.

The expansion of women's access to education was one of the main goals of the Ukrainian women's movement in the 19th century. Western Ukrainian women's advocates successfully fought for the right to study in universities (granted in 1900) and established a variety of women's secondary educational institutions that trained women to become teachers or enter skilled trades.

Higher education in the Russian Empire was closed to women (except for brief periods of reform in 1860–1862 and 1906–1909). Segregated women's higher educational institutions briefly existed (1878–1886) but were closed by state authorities. After 1905, educational institutions were established for women, mainly to train teachers, but also physicians, lawyers, and engineers.

Under communism, education was an important area where the status of women was enhanced. In the USSR, women were granted access to free coeducational public education that included preschool, a general primary and secondary education, extracurricular recreation, vocational training, and specialized secondary educational and higher educational institutions (e.g., universities).

Education up to the completion of secondary school is mandated by Ukrainian law. Most girls and boys attend preschool starting at age 3, and nearly all attend primary school starting at age 7. An estimated 10,000–20,000 children in Ukraine do not attend primary school. Most have special needs that cannot be met by the school system or belong to the Roma minority (also known as Gypsies), who suffer from discrimination and poverty. Students who fail to complete secondary school typically leave school early for financial reasons. Most secondary school students graduate, and nearly half enroll in university or postsecondary vocational schools.

According to official sources, girls have constituted the majority of secondary school graduates since the early 1990s (54%–57%). Women are also slightly overrepresented among college and university graduates, accounting for 56 percent of students working for master's degrees and just under half of students studying for doctorates (48%). While substantial gender disparities in educational access are absent, and women are better educated than men, they are highly concentrated in certain fields where they constitute the majority of students: medicine, education, economics, business, the humanities, and social sciences. Furthermore, the proportion of women among all scientific personnel with a postgraduate qualification grows smaller at each level of education. They constitute 50 percent of master's degree holders and 24–27 percent of doctoral degrees holders; yet, only 4 percent of the members of the national academies of science are women.

Employment

Labor regulations are relatively gender neutral. On paper, entitlements to day care and other services for working parents appear generous. However, studies find that Ukrainian women face discrimination at every stage of employment, from hiring to retirement. Single mothers struggle to support themselves, often working more than one job or migrating to work in the European Union or North America while leaving their children to be raised by grandparents.

The rate of employment for women in Ukraine (57.5% in 2011) surpasses the levels for most South and East European countries and is close to the average for the European Union (58.5%). However, this employment rate represents a considerable decline since the Soviet era.

Employment was compulsory for Soviet citizens, and most women—as many as 9 out of 10—were employed or engaged in study full-time until they retired at age 50. Nevertheless, job opportunities in Soviet Ukraine were highly segregated by gender. Women were predominantly employed in low-paying, menial jobs in agriculture or in caregiving occupations that were coded as feminine, such as in health and social services, retail trade, and preschool and primary education. Furthermore, the division of labor in the household remained unquestioned, leading to expectations that women should work full-time outside the home while shouldering a heavy burden of household duties. This double burden of full-time employment and responsibility for the household and family worked in conjunction with traditional gender norms to make career advancement considerably more challenging for women than men.

Since the collapse of the Soviet Union in 1991, opportunities for employment and career advancement have narrowed still further for most women. The 1990s were a period of hyperinflation and economic upheaval, when numerous state enterprises that employed a female workforce were closed or privatized. Many women—even those who remained employed—found themselves unable to make ends meet. It became common for women to work more than one job or to operate small microbusinesses to earn extra income. An increase in labor force participation among women was observed in the following decade as the economy stabilized, but another decline occurred after the 2007 global recession and during the 2014 invasion by Russia. Overall, in the last decade, employment among women has grown at less than half the rate of 5–7 percent observed in most countries in the European Union.

Pay

Women in Ukraine earn between a quarter and a third less on average than men (Dudwick, Srinivasan, and Braithwaite 2002, 32; United Nations Development Program 2003, 46). This gender gap is a central concern of advocates for women's equality. State programs to establish gender equality in Ukrainian society identify eliminating the pay gap as a high priority, but little progress has been made thus far.

The pay gap is a result of the concentration of female jobs at the lower end of the labor market and of discrimination against women in hiring and promotion (Dudwick et al. 2002, 31–32; Hrycak 2001, 147). Women typically work in low-wage branches of the economy, such as agriculture, or in lower-status professional spheres, such as health care, social work, education, culture, and state administration. Widespread employer discrimination against women in hiring and promotion further limits women's advancement opportunities. Men hold nearly all top-level managerial positions, even in occupations where women predominate at the entry level and in middle management. Employers also routinely specify gender when advertising vacancies, even though this practice is not permissible under Ukrainian law. Failure to hire or promote professionally qualified women results from stereotype-driven assumptions about women's physical and intellectual limitations, their family responsibilities, and their age and appearance (Dudwick et al. 2002, 30–42). As a result, women are pushed into jobs in the low-wage service sector or public sector or are compelled to seek employment in the unregulated informal sector, where employees do not receive an employment contract and are paid off the books (Dudwick et al. 2002, 64).

Working Conditions

In the 1990s, women were overrepresented among the unemployed. Many also experienced “hidden” or “unofficial” unemployment, when workers were temporarily dismissed, forced to take unpaid leave, or expected to significantly reduce their working hours due to idle production lines and a lack of money for wages. In the 1990s, about 2.5 million people were forced to take unpaid leave, about 1 million people were compelled to work only a few days a week, and many workers in public-sector jobs received their wages months late. At this time, many women began to peddle goods on the streets or in open-air marketplaces, where they faced challenging conditions: long hours, weather extremes, and organized crime.

Today, women are no longer overrepresented among the unemployed. However, many have permanently moved to precarious jobs in the informal sector of the economy that are unregulated by employment contracts and not subject to pension benefits or labor regulations. In response to a lack of employment opportunities, many women have left Ukraine to go abroad to seek work. These labor migrants typically take jobs as nannies or cleaners in Southern and

Eastern Europe. Some have been trafficked into the commercial sex industry.

Sexual Harassment

Sexual harassment is reportedly widespread, accepted, and misunderstood. Many women consider it a fact of life that men in the workplace—male managers in particular—will attempt to initiate relationships with women workers and that refusing such offers may lead to dismissal or some other retaliation.

Social and Government Programs to Support Motherhood

State support for mothers in Ukraine appears generous. At the time of independence, the Families with Children (State Assistance) Act of 1992 guaranteed monetary support from the state for all families raising minor children. This act provided for a wide variety of forms of state assistance: pregnancy and childbirth benefits, a one-off childbirth allowance, supplementary childbirth assistance, a child care allowance for children aged under 3 years, cash benefits for mothers (parents) caring for three or more children aged under 16 years, a child care allowance for disabled children, an allowance for children aged under 16 years (18 years if they are at school), an allowance for single mothers raising children, a children's allowance for members of the armed forces on fixed-term service, a children's allowance for children under guardianship, and temporary assistance for minor children whose parents refuse to pay maintenance or when it is impossible to collect maintenance.

In practice, these benefits were difficult to use and nearly worthless, as they were pegged to extremely low official wages in the official economic sector (e.g., in the early 2000s, the average public-sector monthly wage was equivalent to only USD\$120–\$140). The state child's allowance in 2001, for instance, set at 10.9 percent of the average official monthly wage, came to roughly USD\$13–\$15 (10.9 percent of USD\$120–\$140 in 2001) and covered only the most basic needs for a period of a week. Single mothers living alone and without any additional sources of income faced extreme economic distress and deprivation living on state benefits. This comprehensive system was also criticized for its complexity (offering a profusion of various types of universal assistance and compensation, each governed by the extensive legislation regulating these matters, rather than a single regulatory instrument).

With encouragement from international lenders, who were concerned about reducing fiscal pressures on the state, Ukraine has attempted to turn from a broad-based benefits system to means-tested social welfare benefits primarily targeted to needy women with children. State benefits to support mothers of children have increased in recent years but remain inadequate. In 2010, the means-tested minimum payment for a child 6–18 years old was 287 hryvnias (just under USD\$36) and the maximum approximately 500 hryvnias (USD\$62.50).

Maternal Leave

Parental leave policies in Ukraine appear generous and conform to International Labour Organization (ILO) recommendations. Pregnancy, childbirth, and child care leave at full pay are granted for 70 calendar days before the birth and for 56 calendar days thereafter. Ukrainian law grants the right to parental leave to both parents and provides for extended leaves for caretakers of children under the age of three and for caretakers of handicapped children up to age six. However, fathers seldom exercise this right. Mothers are not only entitled to three years of leave from work to care for a child, they have the right to return to their job. In cases of illness, mothers may be granted leave without pay for the period specified in a medical report until the child's sixth birthday.

In practice, these generous benefits are difficult to use, as many Ukrainians are informally employed and work mainly off the books. Fathers rarely use parental leave because of the traditional division of domestic labor, but also because the government has failed to promote and inform about the possibility for men to use parental leave. Flexible work arrangements are also underdeveloped, and employers are generally skeptical of demands for flexible arrangements for employees with family responsibilities.

Day Care

As Soviet Ukrainian women typically worked full-time, nearly all children entered day care or were taken care of by grandparents. The number of public day care facilities has decreased sharply since independence, leaving many working mothers struggling to gain access to the relatively few day care spots available today. According to one survey, in the late 1990s, only 34 percent of parents were using public day care establishments, 0.9 percent relied on private kindergartens, and 1.6 percent hired au pairs. During the 1990s, the percentage of working women with young children fell from 50 percent to 39 percent.

It is difficult today for mothers of young children to combine a job, let alone a professional career, with family duties. The socioeconomic conditions and popular beliefs in Ukraine place considerable burdens on mothers that prevent mothers of young children from working at all. Day care remains more accessible in urban areas, but even there, it is often unaffordable. In contrast to past decades, most Ukrainian women today leave the labor force to look after their children from birth until the age of three. After they conclude the three-year maternity leave, women are considered less employable by employers, who perceive them as having lost skills and expect that they will miss work to care for their children.

Close to 60 percent of children between the ages of three and six now attend preschool. However, many children are turned away. According to the data of the Ministry of Education and Science of Ukraine, preschool establishments in most provinces have the capacity to serve only 70–80 percent of the children of preschool age. For example, in the Sumy and Rivne provinces, there are 120 children per 100 places in kindergartens; in Volyn province, 126 children per 100 places; in Dnepropetrovsk, 127 children; and in Ternopol, 138 children. In Odessa, there are 145 children's establishments and 19,000 preschool-age children.

Family Life

Women's roles in Ukraine have long been associated with motherhood and caregiving. The Soviet state mandated that women seek employment outside the family, but it also promoted a cult of the large family and motherhood. Childbearing was encouraged through a system of awards for women who raised many children, referred to as "mother-heroines."

Except for a brief period of sexual liberalization in the 1920s, when traditional gender norms were challenged, female sexuality was highly regulated throughout the 20th century. Fearing that free sexuality would distract men as workers and citizens, party leaders discouraged discussions of sexuality and failed to invest in contraception and modern family planning services. Sexual relations were fraught with anxiety due to the unavailability of modern contraceptives and the inhumane conditions women faced when undergoing abortions or giving birth without anesthesia.

In recent decades, improvements in contraception and family planning resources have given women greater control over the timing and number of children they

will bear. However, women today find themselves subjected in the media to new forms of sexualization and consumerism that pressure them to place priority on their physical appearance and encourage them to realize themselves by becoming good wives and mothers, rather than by pursuing careers or achieving independence and self-actualization.

Marriage and Reproduction

At the beginning of the 20th century, marriage and child-bearing dominated the lives of most Ukrainian women. Ukrainian girls typically married between the ages of 15 and 18 and gave birth to seven children, on average. The birth rate declined prior to World War I and remained low throughout the Ukrainian War of Independence (1917–1921). The birth rate increased in the 1920s in the Ukrainian SSR, peaking at 5.4 children per woman in 1925–1926, before entering a long period of decline (Perkovsky and Pirozhkov 2015, 149). From the mid-1960s to the late 1980s, fertility stabilized at just below 2 children per woman. In the 1990s, it dropped to 1.1 children per woman, one of the lowest rates in Europe. In recent years, while a slight increase has occurred, the birth rate remains below the replacement level, as most Ukrainian women are giving birth to only one child.

Women in Ukraine today tend to marry and give birth at a slightly younger age than their West European and North American counterparts. At present, first marriages typically take place when women are in their late teens and early twenties (Ptoukha Institute for Demography and Social Studies 2010, 41). A 2004 UN report estimated that 10 percent of girls in Ukraine have married by age 19, and most give birth by the time they reach 21. Only about one-third of women between the ages of 20 and 24 years have never been in a registered or unregistered marriage (Ptoukha Institute for Demography and Social Studies 2010, 29).

A great many Ukrainian women are single parents. Divorce is common, and the rate of extramarital child-bearing has also been increasing (State Institute for the Development of the Family and Youth of Ukraine 2014, 8). Historically, rates of extramarital birth fluctuated considerably in early 20th-century Ukraine, from 4 percent to nearly 20 percent, and tended to be higher in areas that were influenced by urbanization and industrialization. In the final decades of the Soviet era, extramarital childbearing remained relatively steady at 9 percent. Since then, the

level of extramarital births has gradually risen, reaching a high of 22 percent in 2010.

Sex Education

Sex education was introduced to schools relatively recently—in a piecemeal fashion in the final years of Soviet rule and more systematically after Ukraine achieved independence. Prior to independence, work to raise public awareness relating to sexuality was mainly carried out by Soviet medical personnel and health educators involved in campaigns to prevent venereal disease (Williams 1994, 82–83). Consequently, female sexuality tended to be medicalized and pathologized. It was typically treated as a public health concern to be handled by medical personnel, rather than as a normal part of personal development and self-expression.

Sex education today is conducted through public health clinics in addition to schools. Despite improvements that have resulted in higher rates of contraceptive use and steep declines in reliance on abortion as a primary method of birth control among young women, the treatment of female sexuality remains inadequate. Health professionals and teachers continue to see adolescent sexuality through a traditional discourse of early motherhood and marriage. Not surprisingly, studies find that young women are more likely to seek advice on contraception from pharmacists than in school or at a health clinic.

Contraception and Abortion

In the past, the abortion rate in Ukraine was one of the highest in the world. Due to the unavailability and low quality of condoms, oral contraceptives, intrauterine devices (IUDs), and other contraceptives in Soviet Ukraine, abortion was the main form of birth control. Since independence, the rate of abortion has declined steadily, and use of contraceptives has increased significantly (to 68.4 percent of women with partners in 2004–2005) (State Institute for the Development of the Family and Youth of Ukraine 2014, 82). The state medical service has expanded access to information on family planning, conducts more active educational work, and has increased the availability of contraceptives. In the period 1993–2004, the number of abortions fell from 66.7 per 1,000 women of childbearing age to 21.1 (and for girls age 15–17, it declined from 31 to 6 per 1,000) (State Institute for the Development of the Family and Youth of Ukraine 2014, 82). The number

of abortions for every 100 births (including stillbirths) dropped from 150 in 1995 to 68 in 2004.

Since 2000, the decline in the number of abortions has been accompanied by an increase in the number of births: 426,000 births were registered in 2004 and 385,000 in 2000 (State Institute for the Development of the Family and Youth of Ukraine 2014, 7). A comparison of the abortion, mortality, and pregnancy rates shows that the number of births from all pregnancies is rising, while the proportion of abortions is falling; in other words, far fewer pregnancies are terminated by abortion (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 34–35). This shift suggests that women are exercising greater control over the timing and occurrence of births.

Despite these signs of progress, expanding family planning services and broadening access to contraception remain ongoing concerns for women's advocates in Ukraine. In 2012 and 2013, women's advocates mobilized in opposition to proposed legislation to ban abortion that was motivated by lawmakers' belief that a repeal of abortion would raise birth rates.

Teen Pregnancy

Adolescent birth rates (births per 1,000 women ages 15–19) remained very low in the post–World War II period, gradually increased until 1990, and then declined to levels not previously seen. The adolescent birth rate in Ukraine was 29.5 in 1960. It rose slowly over subsequent decades to a high of 61.4 in 1990, and then declined to 25.7 in 2012.

While teen pregnancy is at historic lows, surveys suggest that the sexual practices and norms of teens have changed in recent years in a liberal direction (Ptoukha Institute for Demography and Social Studies 2010, 46–48; The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 34). Premarital sex has become more common, and the average age of first sexual encounter has dropped. This shift has been attributed to decreasing social control and increasing exposure through the mass media to Western culture. State sources indicate that the teen abortion rate has also decreased steadily (following the downward trend observed for women in general) (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 75–76). However, women's advocates counter that the true rate of abortion among teens is likely to be higher than state statistics reveal, as adolescents today may choose to use private clinics that do not report abortions to the state.

Health

Women's health is an area of great concern for women's advocates in Ukraine (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 75–77). At 76 years of age in 2012, female life expectancy in Ukraine is the third lowest in Europe and four years below the average for Europe as a whole (State Institute for the Development of the Family and Youth of Ukraine 2014, 8). Life expectancy decreased in Ukraine after the collapse of the Soviet Union. While it has increased in recent years, it is now only one year higher than its previous high in 1990.

While mortality rates have remained lower for women than men, by many measures, women's health is in crisis (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 34–37). State sources report that reproductive health deteriorated in the 1990s. According to data from the Centre of Medical Statistics at the Ministry of Health, the number of complications registered during pregnancy, delivery, and in the postnatal period increased significantly in the 1990s (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014). Rates of cancer, in particular breast cancer, have increased steadily.

The public health care system in Ukraine is deteriorating under the impact of mismanagement, corruption, and inadequate financing, which has led to a dramatic decline in the availability, cost, and quality of health care services of all kinds throughout the country (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 75–77). Concerns have particularly been expressed about the decline in the quality and availability of maternal and child health services and inadequate public health measures to promote behaviors that enhance maternal and infant health, such as breastfeeding, prenatal care practices, and immunization.

Health Care Access

Under the Soviet system of public health care, basic medical care was provided at no cost to citizens, but it was beset by chronic shortages of drugs and outmoded practices and equipment. Relative to other industrialized nations and countries in Europe, Soviet Ukraine was characterized by high rates of infertility, sexually transmitted diseases (STDs), and higher maternal mortality and morbidity (Dudwick et al. 2002).

Under Ukraine's Constitution, all citizens are entitled to free health care. However, public health care institutions

are poorly managed, corrupt, and underfinanced, and they lack the capacity to adequately provide health care to the broader public (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 76). Drugs and medical services that were once scarce are generally more available, but they remain unaffordable for most patients. New private clinics cater to wealthy Ukrainians and foreigners. (Ukraine is a popular destination for Western couples seeking to have children through surrogacy.) State health care organizations are supposed to provide care to the public, but they are unable to handle the needs of many of their patients. In state clinics, patients must typically provide under-the-table payments in exchange for medical care (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 76–77). The closure of many primary care and obstetrics clinics in towns and rural areas has further narrowed women's access to basic medical services. Women who live outside major urban centers typically cannot afford clinics that provide high-quality services. Women who are HIV-positive and sex workers suffer discrimination in the health care system and receive very limited reproductive health services (Ukrainian Helsinki Human Rights Union and Kharkiv Human Rights Protection Group 2008, 172–73).

Since Ukrainian independence, a number of national programs have attempted to improve the health status of specific subpopulations or the population as a whole. They include Family Planning, AIDS and Drug-Addiction Prevention, and Children of Ukraine (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014). These programs were initiated in response to public officials' concerns over adverse trends in population development and health status: a decline in the birth rate and increases in mortality leading to population decline; a falling level of female reproductive health; the deterioration in the health status of pregnant women; an increase in the level of women's reproductive tract diseases and STDs; and high rates of maternal and infant mortality. In the past decade, some of these areas have seen improvement. Notably, for instance, the ratio of maternal mortality (the number of deaths during the pregnancy or within 42 days of delivery per 100,000 live births) has decreased by nearly half since independence, from 49 in 1990 to 23 in 2013 (World Health Organization 2015). Nevertheless, it remains high relative to the levels found in other Eastern and Central European countries and is three to four times higher than in the countries of Western Europe. (The World Health Organization (WHO) estimates that from

1990 to 2013, the maternal mortality ratio decreased from 48 to 11 in Estonia, 17 to 3 in Poland, 10 to 4 in Austria, 13 to 7 in France, and 9 to 4 in Norway.)

Diseases and Disorders

The top causes of death for both sexes are cardiovascular disease, cancer, and traumatic injuries (e.g., fatal accidents, poisoning, suicide, etc.) (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 35–36).

The prevalence rate of HIV in Ukraine is one of the highest in Europe (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 36). In recent years, it has been estimated at ranging from 0.8 to 1.4 percent of the adult population. The disease spread rapidly in the 1990s and had reached epidemic proportions by the close of that decade. HIV/AIDs was initially concentrated among male intravenous drug users. Studies find that it is now spreading more widely through sexual contact. Women constituted 41 percent of the country's estimated 190,000–260,000 people living with HIV in 2012. Through the efforts of the All Ukrainian Network of People Living with HIV, the largest of Ukraine's HIV-prevention advocacy groups, Ukraine is making strides in reducing new HIV infections. Nonetheless, among women, HIV infection remains the leading cause of deaths from communicable diseases.

Eating disorders as a phenomenon were unacknowledged in the past, but they appear to be growing more common among young women in their teens and twenties (Bilukha and Utermohlen 2002). Women's advocates attribute their rise to a new cultural emphasis on thinness that has become pervasive in Ukrainian society in response to exposure to Western media. The rise in eating disorders also reflects increasing awareness of eating disorders among local physicians and women's advocates. The country's first eating disorder outreach initiative was started in 2011 in the city of Lviv to provide support to women who are experiencing eating disorders and to raise public awareness of eating disorders.

Cancer is the second most common cause of death for women in Ukraine. The incidence of breast cancer, the most common cancer among Ukrainian women, has increased significantly in the last 25 years, from 23 women per 100,000 in 1986 to 71 in 2011 (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 34–35). While women's health advocates in Ukraine

urge women to perform monthly self-exams and to undergo clinical breast exams by a doctor or nurse during annual gynecological checkups, women often fail to follow this advice. Consequently, while in Western Europe and the United States the number of late-stage cases is not more than 5–7 percent, according to the National Cancer Register in Ukraine, every year more than 30 percent of new breast cancer cases in Ukraine are identified in late stages. Breast cancer mortality continues to rise in Ukraine, where each year one out of five women with breast cancer die. A combination of factors have been identified as driving these dynamics, including widespread public exposure to carcinogens, a low level of public awareness about screening, and inadequate state investment in screening services and mammography machines (United Nations Development Program 2003, 75).

Total alcohol consumption in Ukraine is 14 liters on average per year, comparable to levels found in other post-communist countries, which are among the highest in the world (World Health Organization 2014). Alcohol abuse, a serious problem in the communist era, is a leading cause of death in Ukraine. The incidence of alcohol use among women in Ukraine is significantly lower than among men, 7.2 liters per year for women compared to 22.0 for men. Alcohol abuse is also significantly lower among women than men. The WHO estimates that 1.1 percent of women and 9.3 percent of men in Ukraine suffer from an alcohol disorder. Nevertheless, alcohol bingeing is believed to be a significant factor leading to abuse by men of their intimate partners and families.

Politics

While women constitute a numerical majority of the population of Ukraine, and a number of prominent women have served in the Ukrainian government, women are underrepresented in the judicial, executive, and legislative branches of government (The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014, 45).

Suffrage

Ukrainian women won the right to vote in the early 20th century. Suffrage was granted in 1914 in the Austrian provinces of Galicia and Bukovyna; in 1917 by the Ukrainian regions of the Russian Empire; and in 1918 by Poland. However, for most of the 20th century, the right to vote was largely symbolic. In the Soviet Union, candidates for

election were selected by party leaders and ran unopposed. Voting was considered mandatory, and citizens faced punishment if they failed to cast their ballot.

Political Participation

The representation of women in Ukrainian politics declined sharply after the end of the gender quotas of the communist era. Since then, female representation has fluctuated, but it demonstrated a slight upward trend while remaining in the single digits until recently.

Women in 1990 were elected to only 3 percent of the seats in Ukraine's Rada (United Nations Development Program 2003, 10–11). In 1994, their share of seats increased to 5 percent. In 1998, the overall proportion of women elected increased to 8 percent, but then it dropped again in 2002 to 5 percent, earning Ukraine the dubious distinction of being in last place in Eastern Europe in terms of women's parliamentary representation. In 2006, the level of women's representation again rose to 8 percent and remained at this level in the preterm elections of 2007 (HESLI 2007; Hrycak 2006). In 2012, the overall percentage of women rose for the first time to 10 percent (Interparliamentary Union 2014).

Despite this recent increase, there are fewer women in the Ukrainian legislature than in most neighboring countries and far fewer than in most Western European countries. In Ukraine's 2012 parliamentary elections, when women won 10 percent of the seats in the Rada for the first time, this level placed the country 115th in the world, just behind Kenya (114th) and ahead of the Democratic Republic of Congo (116th). Among Eastern European countries, only Hungary had a lower percentage of women legislators at that time (9 percent, 117th in the world) (Interparliamentary Union 2014).

Women's Rights

Women in Ukraine have expressed their interests and demands for rights through a variety of forms of activism (Bohachevsky-Chomiak 1988). In the Ukrainian territories of the Russian Empire, women's organizing included participation in clandestine women's circles and informal networks, but also more sizeable women's charities, trade unions, and federated organizations. Among the main issues women activists raised were universal suffrage, educational access, the protection of women workers from exploitation, and minority women's rights to self-determination.

Outside of the Russian Empire, in Habsburg-ruled Western Ukraine, women organized more freely. Under the leadership of Natalia Kobrynska (1855–1920), a socialist feminist who is considered the founder of the Ukrainian women's movement, women campaigned for suffrage and women's rights to university education, organized mass membership organizations, and operated diverse organizations for the empowerment of working women (a girl's dormitory, subsidized cafeterias, a federated women's cooperative, nursery schools, and societies for organizing domestic servants).

Independent women's organizations were banned in the Soviet Union. Women's rights were established by the state "from above" in the early 1920s, through the passage of laws granting women equality and the establishment of a system of women's sections within the Communist Party that the state later dissolved. The political and economic reforms of the 1980s briefly allowed debate and protest, initiating discussions of women's double burden of work and family and spurring heightened activism among women. Women joined a variety of protest organizations, bringing attention to the issue of violence in the military through a pan-Soviet movement of Soldiers' Mothers Committees and to the environment (including in response to the Chernobyl nuclear accident), while also joining the emergent movement demanding independence from the USSR.

Women's activism in Ukraine has increased in scope since independence. Women's organizations have come together to strengthen legal protection against domestic violence (2002) and ensure equal rights (2005) and participated in projects to fight human trafficking and assist its victims (2003). Despite these achievements, the women's movement is plagued by problems that have blunted its political potential. Public opinion polls suggest that very few Ukrainian citizens know about the existence of women's organizations, and even fewer have ever participated in their activities—most do not trust them. The movement lacks the capacity for coordinating political campaigns and has limited resources for challenging state leaders.

Military Service

Women serve in the Ukrainian military, but they are barred from service in certain branches and positions and face discrimination. According to figures provided by the Ministry of Defense, as of 2006, more than 50,000 women were serving in the country's armed forces (4,219 of them as civil servants and 422 as officers in senior posts holding

the rank of "Chief" or "Commanding Officer"). The percentage of officers who are women more than tripled from 2001 to 2006, rising from 0.7 percent of the total complement of officers to 2.25 percent.

The female military officer with the highest visibility is Nadia Savchenko, the first woman to train as an air force pilot and fly a bomber in active combat. She was the subject of many news reports and a full-length documentary film. In 2014, Savchenko was captured by rebels in an area of Eastern Ukraine that had been invaded by Russian paramilitary forces. She was later forcibly relocated to the Russian city of Voronezh, where she is being tried for the killing of Russian journalists who died while covering Russian forces in Ukraine.

Religion and Spirituality

Women constitute the majority of active believers in Ukraine's main religious denominations. However, they are forbidden from becoming clergy and play a limited role in the administration of religious institutions.

Issues

Violence

Violence against women is prohibited under Ukrainian law. Ukraine was the first post-Soviet country to respond to the policy recommendations of global campaigns against gender violence. In 1998, Ukraine formally criminalized trafficking. In 2001, the state introduced further changes to bring its antitrafficking legislation into closer conformity with international treaties. Ukraine was also the first postcommunist country to pass a law to combat domestic violence.

Despite these promising steps, after years of raising public awareness by women's organizations, these laws remain largely unimplemented, violence against women remains underreported, and enforcement of laws against gender violence is a low priority for law enforcement officials (Hrycak 2010; The Ministry of Social Policy of Ukraine and United Nations Population Fund 2014; Ukrainian Helsinki Human Rights Union and Kharkiv Human Rights Protection Group 2008). Domestic violence has attracted a great deal of public sympathy, but it continues to be viewed by police as a family issue rather than a problem that requires the intervention of law enforcement or the state (The Advocates for Human Rights 2014). Abuse of women is often seen in the broader public as a problem

that affects the fringes of society, where it is caused by alcoholism, crime, and other pathologies that cannot be remedied. These and other issues have received the attention of many advocates, in particular, the advocacy group La Strada Ukraine and the women's center Western Ukrainian Women's Perspective.

There is no reliable data on the incidence of violence against women nationwide. Victimization surveys provide estimates suggesting that it is widespread (Barrett, Habibov, and Chernyak 2012). One of the first nationwide surveys, conducted by the National Academy of Sciences of Ukraine in 1995, found that domestic violence, sexual harassment, sexual exploitation, and forced prostitution were prevalent among adult and adolescent women in Ukraine (Weber and International Helsinki Federation for Human Rights 2000). Around 20 percent of those surveyed had been beaten by their husband, 14 percent had been sexually assaulted, 10 percent had been sexually harassed, 4 percent had been affected by trafficking in women, and 4 percent had experienced pressure to engage in prostitution. Many of the women surveyed indicated that they had experienced sexual violence during childhood or adolescence. One-seventh, or 14 percent of the women polled, reported having been raped in their childhood or in their teens. Another 10 percent of those polled had been subjected in childhood or adolescence to attempted rape. The 2007 Ukraine Demographic and Health Survey found slightly lower rates (Barrett et al. 2012). Seventeen percent of women aged 15–49 reported experiencing physical violence since age 15. Five percent of women reported past experiences of sexual violence, and 2 percent reported that their first sexual intercourse was forced against their will. The most common perpetrators of sexual violence were former or current husbands or partners.

The collection of data on domestic violence by state agencies started with the implementation of the Law on Prevention of Family Violence in 2001 and is mostly done by district police inspectors who handle domestic violence cases. Reports show that the number of reports continues to rise. Domestic violence, sexual violence, and rape, in particular, are underreported: advocates estimate that 75–95 percent of sexual assaults are never reported to the police.

Ukraine's Human Rights Ombudsmen and representatives of its women's rights and human rights advocacy groups have expressed ongoing concern over the high rate of domestic violence and the inadequacy of the state's handling of victims' cases. Advocates of women's rights

estimate that nearly every third complaint to the police is related to this type of violence. State officials have responded by noting that more than 30 crisis centers and centers for social and medical rehabilitation of victims of the domestic violence in the country have been founded in response to the Domestic Violence Act. However, advocates consider this inadequate, as government centers offer limited legal and psychological assistance (mainly serving victims of domestic violence under the age of 35). Despite legal mandates, municipally funded shelters are absent in most provinces and not always accessible in the few cities where they exist, as shelter services were restricted to registered residents and some lacked the resources to operate year-round.

Lesbian Rights

In the Soviet era, lesbians in Ukraine were subjected to involuntary psychiatric and medical treatment and prevented from organizing or developing into a community. Consequently, when Ukraine achieved independence, women who were sexually attracted to other women did not see themselves as sharing a common identity. In subsequent decades, lesbians have started to develop a voice and demand equal treatment and respect, working through gay and feminist advocacy groups to defend their rights, promote tolerance, and build community. Most lesbians still do not openly discuss their sexuality within the public sphere out of fear of retaliation and persecution (Geïdar and Dovbakh 2007; Redhead 2007).

United Kingdom

Overview of Country

The United Kingdom is composed of England, Scotland, Wales, and Northern Ireland. The country is sometimes referred to as the United Kingdom of Great Britain and Northern Ireland, the name established by the Royal and Parliamentary Titles Act of April 12, 1927, and is commonly abbreviated as U.K.

The name designates an island group situated in Western Europe between the North Atlantic Ocean and the North Sea and located toward the northwest of France. The total area of the United Kingdom is 243,610 square kilometers, with 12,429 kilometers of that being coastline. Its insular geography and dependence on the sea have defined much of its history, which includes the development of the world's dominant navy in the 19th century, when Britain ruled an "empire on which the sun never set." Since the mid-20th century, the postimperial United Kingdom has held a greatly diminished global presence, though London remains a major hub of global finance. The country's terrain, "England's green and pleasant land," in William Blake's memorable phrase, is made up primarily of open plains (often crossed by hedgerows) and rugged hills with low mountains. The highest point in the United Kingdom is Ben Nevis, standing 1,343 meters high. The climate is temperate with moderate weather, and over one-half of the days are overcast (CIA 2015).

The population of the United Kingdom is growing. As of July 2015, the total population was 63,843,856, with a rate of 12.17 births and 9.35 deaths per 1,000 people (CIA 2015). The migration rate is 2.54 migrants per 1,000 people, largely from Eastern Europe. Historically, the European Union (EU) has allowed relatively open travel between countries. This proved to be an important issue

in the United Kingdom's recent "Brexit" vote to leave the European Union.

As the United Kingdom is separated into four areas, England, Scotland, Wales, and Northern Ireland, each has its own capital city. However, the capital of the United Kingdom as a whole (as well as being the capital of England) is London. Cardiff, a city in the South of Wales, is Wales' capital; Edinburgh, located in the South of Scotland, is the capital of Scotland; and Belfast, the region's largest city, is Northern Ireland's capital. London has a population of 10.313 million people (CIA 2015). Inhabitants of the United Kingdom predominantly live in cities, with the urban population comprising 82.6 percent of the total population. Other major urban areas include Manchester (2.66 million people), Birmingham (2.515 million), Glasgow (1.223 million), and Liverpool (870,000).

The population of the United Kingdom is fairly young, with a median age of 40.4 years, men being slightly younger than women (39.2 versus 41.6). At birth, the life expectancy of a person is 80.45 years (CIA 2015). Additionally, the country is fairly homogeneous: nearly 90 percent of the British population is white (87.2%). Other ethnic and racial groups—including Black British (people of African or Afro-Caribbean descent) and Asian British (people of Indian or Pakistani heritage)—each make up 2–3 percent of the population (CIA 2015).

The language of the United Kingdom is English, with about 30 percent of the Scottish population speaking Scottish Gaelic, about 20 percent of the population of Wales speaking Welsh, and about 10 percent of the Northern Ireland population speaking Irish. Over half of the British population, 59.5 percent, declare themselves Christian, which primarily includes Anglicans, Roman Catholics, Presbyterians, and Methodists. The next largest religious groups are Muslim (4.4%), followed by Hindus (1.3%). A full quarter of the population (25.7%) does not affiliate with a particular religion.

The United Kingdom has the third-largest economy in Europe after Germany and France, with less than 2 percent of the workforce producing around 60 percent of the food needed domestically (CIA 2015). Service industries, especially banking, insurance, and business services, are the drivers in the U.K. gross domestic product (GDP) growth. Although the United Kingdom was hit by the worldwide recession in 2008, it has since bounced back. GDP grew in 2013 by 1.7 percent; in 2014 by 2.9 percent; and in 2015 by 2.2 percent (CIA 2015).

The United Kingdom's primary export partner is the United States (14.6%), followed by Germany (10.1%), Switzerland (7%), and China (6%). All except Switzerland make up the top import partners of the United Kingdom, albeit in a different order: Germany (14.8%), China (9.8%), and United States (9.2%). The top four are rounded out by the Netherlands, with 7.5 percent of imports (CIA 2015). In terms of materials traded, the United Kingdom imports and exports manufactured goods, fuels, and foodstuffs (CIA 2015).

The United Kingdom enjoys an excellent public transportation system, including air, rail, and bus transport. There are a total of 460 airports in the country, 271 of which have paved runways. The biggest airports are Heathrow Airport in London, Manchester Airport, and Glasgow Airport. Rail lines crisscross the United Kingdom, with a total of 16,827 kilometers of railways (CIA 2015). A Virgin Train runs all the way from London's Euston railway station to the Glasgow railway station in Scotland.

The United Kingdom's government is a constitutional monarchy, with a regionally elected Parliament, a prime minister elected by that Parliament, and the monarch as honorary head of state. The monarchy is hereditary and traditionally passed down to the eldest son, a system known as *masculinist primogeniture*. This system was changed in 2013, when the Succession to the Crown Act made succession to the throne independent of gender. Barring deaths unforeseen, for the next three generations of monarchs, this change will not affect the line of succession, as the current monarch, Queen Elizabeth II (1926–) has three male heirs (Princes Charles, William, and George).

Because the United Kingdom operates as a constitutional monarchy, the monarch opens and closes sessions of Parliament, but most of the royal functions are ceremonial. One ceremonial duty is the queen's formal assent to the prime minister's request to create a government and cabinet. Queen Elizabeth II has ruled since February 6, 1952, and is the nation's longest-serving monarch, surpassing her grandmother, Queen Victoria. Her heir is the Prince of Wales, Charles, the longest-serving heir, who will, if surviving her, assume the throne upon his mother's death or abdication. In keeping with the government as a constitutional monarchy, the national anthem is "God Save the Queen" (or "God Save the King"), in use since 1745.

The current head of the government is Prime Minister Theresa May (1956–), a leading member of the Conservative Party who replaced David Cameron (1966–) upon his

resignation after the Brexit vote; he had been prime minister since May 11, 2010. The cabinet consists of members of parliament (MPs) who are unilaterally appointed by the prime minister. Individuals who serve in cabinet positions usually begin and end their tenure with their appointing prime minister. Cabinet positions in the United Kingdom include a Secretary of Foreign and Commonwealth Affairs, a Home Secretary, and Chancellor of the Exchequer. The prime minister is the leader of the majority party following elections, which normally occur every five years; though in a crisis of confidence, a majority of the house may call for elections.

There is no written constitution in the United Kingdom, much of the law coming from either statutes or common-law practice. Recently, it has added the Human Rights Act of 1998 and the Constitutional Reform and Governance Act of 2010 to its laws. The legal system is one of common law, and there is a nonbinding judicial review of Acts of Parliament under the Human Rights Act of 1998.

The United Kingdom signed the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) on July 22, 1981. The document was ratified on April 7, 1986. The United Kingdom accepted the optional protocol to CEDAW, enabling enforcement of convention rights, on December 17, 2004. As of 2015, the United Kingdom is ranked 28th out of 188 nations (0.131) on the UN Development Programme's (UNDP) Gender Inequality Index (GII) (UNDP 2015). The United Kingdom has signed and ratified a number of UN treaties concerning gender inequality and women's status, including the CEDAW. Gender inequality and discrimination against women are not as prevalent as they once were in the country. However, there remain significant gender gaps in wages for full-time workers and in the relative number of men and women serving as members of parliament.

Girls and Teens

Of the more than 64 million people in the United Kingdom, 17.3 percent are 14 or younger. Of that percentage, 5.38 million, or 48.6 percent, are girls. The 15–24 age range comprises 12.6 percent of the population, and 3.9 million, or 48.9 percent, are female (CIA 2015).

The United Kingdom has a low infant mortality rate of 3.6 deaths per 1,000 live births. This is the lowest rate ever recorded in England and Wales. This was also a decrease from 3.8 per 1,000 live births in 2013 and a significant

decrease from 1984, when the rate was 9.5 deaths per 1,000 live births (ONS 2013a). Due to improved maternity services for both antenatal and postnatal care, women are being seen more frequently by their doctors or midwives for increased screening, thus reducing the infant mortality rate.

Education

In the United Kingdom, there are five stages of education: early years (ages 3–5), primary (ages 5–11), secondary (ages 11–16), further education (ages 16–18), and higher education. Under the law, education from ages 5 (4 in Northern Ireland) to 16 is compulsory (18 in England). This education does not have to be in a school; some parents choose to teach their children at home. For those children within the school system—primary and secondary—there is a national curriculum that institutions must follow. At 16, students take the General Certificate of Secondary Education (GCSE) national examinations. Although education is required until the age of 18 in England, students between the ages of 16 and 18 face multiple options that include a college or Sixth Form that would lead to A-Level qualification. The Sixth Form can be a continuation of high school or attendance at another school. A different option may include vocational study or apprenticeship. Higher education involves a three-year bachelor's degree and postgraduate degrees that include master's or doctorate degrees. The literacy rate in the United Kingdom, defined as a person over the age of 15 with at least five years of education, is virtually perfect, standing at 99 percent for both males and female (CIA 2015).

Girls outperform boys on standardized tests (the GCSE and A-Level), but there is a significant difference between the types of degrees each achieves, with more men than women getting degrees in the hard sciences (Sadker, Sadker, and Zittleman 2009). Since 1995, girls have outperformed boys by around 10 percent in achieving five A*-CGCSE results, with 63.4 percent of girls versus 53.8 percent of boys attaining this goal (Gender and Education 2013). Although most subjects are taken by both girls and boys (9 of the 10 subjects were the same for both genders), girls tend to take more courses in the arts, languages, and humanities, while boys are more likely to take physical education and information technology (Gender and Education 2013).

The differences between girls and boys increase in their post-GCSE choices, with 82 percent of girls choosing to

remain in full-time education compared to 72 percent of boys. Studying for A-Levels also illustrates a significant difference that extends into postsecondary education: as girls again primarily gravitate toward the humanities, their most popular A-Level subject is English; while boys gravitate toward science, with mathematics being their most popular subject (Gender and Education 2013).

Women have made progress in the higher education system. As recently as 1980, only two-fifths of university degrees were awarded to women, whereas today, more women than men receive degrees (Hicks and Allen 1999). The Equality Act of 2010 specifically references admissions processes both in secondary and postsecondary education, stating in Part 6 that schools must not discriminate against students because of gender (Equality Act 2010). However, this has not entirely removed the differences in choice of study between boys and girls.

Health

Access to Health Care

The United Kingdom has government-sponsored health care in the form of the National Health Service (NHS). This service was started in 1948 pursuant to the idea that everyone should have access to good health care. The NHS is made up of various organizations and is focused on diagnosis and preventative treatment for all individuals. It largely provides these services free of charge to patients in the United Kingdom. Privately funded health care is also available to paying customers who can afford it and prefer to avoid the heavily trafficked NHS. The first level of health care is general practitioners (GPs). There are over 36,000 GPs in England. Health expenditures account for 9.3 percent of GDP as of 2011. There are approximately three hospital beds per 1,000 people (CIA 2015).

Maternal Health

The founding of the NHS in 1948 brought changes to maternal health care. Maternal health care is divided between three parts of the NHS: the hospital, GPs, and local health authorities or health visitors who visit the mother and child after the birth and for a period of up to one year and also run maternal clinics. In the second half of the 20th century an increasing number of women gave birth in a hospital and with intervention, for example, with an induction. By the 1970s, around 41 percent of births were induced, up from around 15 percent in 1965 (Davis 2013).

Since the 1970s, there have been significant changes in maternity policies in the United Kingdom that have seen women's choices being taken into account in determining how and where to give birth (at home, in a hospital, or in a birthing center). In addition, some women choose to have midwife- or GP-supervised births as opposed to hospital doctors in a maternity ward. With these significant changes in maternal health, the maternal mortality rate is very low in the United Kingdom (along with the infant mortality rate). While the maternal mortality rate had reached more than 40 deaths per 10,000 births between 1900 and 1937 (Davis 2013), this ratio is significantly lower with 1 death per 4,600 births (CIA 2015). Even so, there appears no universal understanding for how women should give birth. There are a variety of options available to women during pregnancy and a substantial level of postnatal care for the mother and child.

Postnatal care is often in the form of health visitors who visit in the family's home and the GP's offices. In the United Kingdom, every child who is under the age of five is given a named health visitor. These individuals are registered nurses with a specialty in community health, child health, and health education who primarily work with the young and the elderly. While the health visitors are primarily there to give advice to new mothers and fathers, they also form a type of surveillance to ensure the child's well-being and report any potential problems or issues (Robinson 2004).

In 2015, there were nearly 700,000 live births in England and Wales (697,852), which represented a slight increase from 2014 (up by 0.4%). The average age of a woman giving birth was 30.3 years, a slight increase from 2014, which was 30.2 years (ONS 2016). In 1970, the mother's mean age when she had her first child was 28.1 (CIA 2015). In 2017, women are older when they have their first child. The most likely age group of a mother in England and Wales in 2013 was 25–34, with more than half of the babies born being to women falling into this age bracket (59%). Twenty-one percent of babies were born to mothers under the age of 25, while another 20 percent of mothers were over the age of 35 (ONS 2016). In 2014, 1.9 children were born to every woman (CIA 2015).

Employment

Roughly one-half of the population is employed in the labor force (32.32 million people). By far, the largest employer is the service sector, with 80.4 percent of people.

A further 18.2 percent is employed in industry, and 1.4 percent is employed in agriculture. The unemployment rate is 5.1 percent, according to a 2016 estimate. Approximately 14 percent of the population is below the poverty line (CIA 2015). Women comprise 47 percent of the workforce (Business in the Community 2016). The majority of part-time workers, more than twice that of men, are women (2.11 million men versus 5.85 million women) (Business in the Community 2016). Because of women working part-time, they are also at a greater risk than men for earning wages below the poverty line during their lifetime (Dennis and Guio 2003). This is a risk for the upcoming generation; according to recent research, millennials (those born between 1981 and 2000) could be the first generation to earn less than their predecessors (Myers 2016).

In keeping with the assistance given to individuals, the United Kingdom has been cast as a liberal welfare state regime by Esping-Andersen (1990). This type of regime is characterized by minimal means testing and a strong reliance on market mechanisms (Esping-Andersen 1990). In practice, this can take the form of creating a gap between full-time and part-time workers, largely because of the market-oriented economy. This partially explains why women have concentrated in part-time work; there is simply more part-time rather than full-time work. That more female-headed households operate close to or below the poverty line is in part due to women holding part-time jobs. This work is also characterized as being largely unskilled or low-skilled (Matteazzi, Pailhe, and Solaz 2014).

Typical Jobs and Careers

As noted above, women are more likely than men to work part-time, especially once they reach childbearing age. Women also often reach a glass ceiling in employment, meaning they are not able to advance their career to the same degree as men. Consequently, women only make up 17 percent of the board of directors of the Financial Times Stock Exchange (FTSE) 100 companies.

Despite not being at the top echelons of the employment ladder, there are a significant number of women who are mothers that are employed in the paid labor force and who also take on the lion's share of household duties and child care. At least 75 percent of mothers engage in nonpaid work, meaning they are primarily responsible for child care in the home (Family and Parenting Institute 2016). Women who work, whether they have children or not, do disproportionately more household chores

compared to men (15% versus 5%, respectively) (Durant 2009). After children, women are more likely than men to work part-time, with 38 percent of women working part-time compared to 7 percent of men (Family and Parenting Institute 2016). These factors, in combination, result in the gender gap in pay, as discussed below.

Pay Equity and Gender Discrimination

Although the United Kingdom is an industrialized democracy where women are treated equally to men, there are still significant areas where equality is lacking. One of these is in pay equity. Equal pay legislation was first signed in the United Kingdom in 1970. Legislation in 1975 followed that focused more broadly on sex discrimination. The central tenets to both pieces of legislation are part of the all-encompassing Equality Act of 2010. Despite these measures to ensure equal pay between men and women, discrimination in employment is still pervasive. Discrimination primarily occurs against women of childbearing age because they may take time off work to have children, which men do not have to do. Women also report having faced discrimination when they were pregnant or on maternity leave, simply for being pregnant.

Like many industrialized nations, the United Kingdom has a gender gap in wages. According to *Business in the Community*, there is a 9.4 percent wage gap between men and women who work full-time, meaning that for every pound a man earns, a woman earns 81 pence (*Business in the Community* 2016). However, for men and women who work part-time, the wage gap is even greater, at a staggering 34.5 percent (EHRC 2011). Part of the reason for the pay gap is that women take time out of the workforce to have children. Child-related career interruptions and discrimination prevent women from reaching the highest rungs of their career ladder and contribute to this lack of pay equity (Meurs and Ponthieux 2011). Thirty-eight percent of employed women have dependent children. Forty-three percent of mothers who have dependent children are employed full-time (*Business in the Community* 2016).

The estimate is that for every year a woman leaves the workforce, her earning potential drops by 5 percent (Gentleman 2009). Although maternity leave is extensive in the United Kingdom, it results in a disadvantage to the woman taking it, which is something men do not experience in their career paths. A report from 2005 found that over half of the 440,000 pregnant women in Britain stated they were

discriminated against by their employer simply due to pregnancy or maternity leave (EHRC 2011).

Maternity Leave

Compared to some other countries, the maternity leave policy in the United Kingdom is generous. All across Europe, as compared to the United States, maternity leave policies are extensive. A woman can take up to 52 weeks, or one full year. Women, of course, are not required to take all 52 weeks of maternity leave, but they are required to take at least two weeks, or four weeks if the woman works in a factory (UK Government 2016).

This maternity leave is not all paid, but the vast majority of it is. Maternity leave pay is granted on a sliding scale. Full-time working women can take up to 39 weeks of maternity pay if they have worked for their employers for at least 26 weeks up to the 15th week of pregnancy (UK Government 2016). Statutory maternity pay (SMP) for the first six weeks is 90 percent of the woman's average weekly earnings, followed by 33 weeks of £139.58 (USD \$179) or 90 percent, whichever is lower. This can be combined with paternity leave, known as shared parental leave, for up to 52 weeks combined. Most companies grant new fathers 2 weeks of paternity leave, usually paid leave. In 2010, Prime Minister David Cameron became the first prime minister to take paternity leave after the birth of his daughter, Florence. Prince William (1982–) also took paternity leave after the births of both Prince George and Prince Charlotte. Ninety-one percent of fathers take paternity leave, but only 29 percent take more than two weeks (*Business in the Community* 2016).

Armed Forces

There are three branches of the military: Army, Royal Navy (includes the Royal Marines), and the Royal Air Force. The commander-in-chief of the British Armed Forces is the queen, and all members of the armed forces declare allegiance to her. Practically, she has little to do with the armed forces, with the exception of ceremonial duties. The Army is chiefly managed by the Defence Council of the Ministry of Defence. The secretary of state for defence heads this office. Individuals aged 16–33 can volunteer for military service, with parental consent required for those under 18. There is no draft in the United Kingdom.

Women have had a prominent role in the military since the 17th century, primarily serving in typical “women's

roles” as nurses or domestic workers. Women began to serve, predominantly as nurses, in the Royal Navy in the late part of the 19th century and have served in active roles in the British Army since 1902. Women were not fully integrated until 1949. While close combat remained limited to men, women became skilled in other positions, such as flying jets. In July 2016, the Ministry of Defence announced that the Royal Armored Corps would begin allowing women to serve in close combat positions (Ministry of Defence 2016). Men and women are expected to meet the same fitness standards, with positions in the Royal Lancers, the King’s Royal Hussars, and the Royal Tank Regiment all accepting applications from eligible women. As of 2014, there are nearly 16,000 women serving in the Armed Forces (15,840), which is 9.9 percent (Ministry of Defence 2014). To serve in the military, a person must be a citizen of the United Kingdom, the Commonwealth, or the Republic of Ireland.

Family Life

Divorce

Over time, divorce in the United Kingdom has become easier to obtain. Prior to the 1937 Matrimonial Causes Act, divorce was only allowed for adultery (and only if men filed for the divorce). After this date, the divorce law was expanded to a range of reasons and allowed either individual to file for the dissolution of the marriage. All divorces are judicially granted, meaning the couple must appeal to the courts to grant them a decree nisi; they cannot simply end their marriage without state intervention.

Prior to the 1937 Matrimonial Causes Act, while men could divorce for adultery alone, women had to have a second cause for divorce, such as incest or cruelty (Herbert 1937). When the Matrimonial Causes Act of 1973 was adopted, it required a three-year separation before a divorce could be granted, which was reduced to one year in the Matrimonial and Family Proceedings Act of 1984. These legislative changes illustrate the relative ease with which a spouse can get a divorce and recognizes a trend around the Western world of increased availability of divorce.

The United Kingdom has a type of no-fault divorce stating that a divorce can be issued to a couple if their marriage has “irretrievably broken down.” However, there are five ways in which this can be proven: adultery, unreasonable behavior, two-year separation if both parties consent to the divorce, two-year desertion, or a five-year separation

if only one party consents to the divorce (UK Divorce 2015). Scotland and Northern Ireland are responsible for their own divorce laws. In Scotland, a person usually appeals to a Sheriff Court, or more rarely a Court of Sessions, which can be done without a lawyer if the divorce is being obtained amicably. Fault is not normally taken into account by the Scottish court when dividing marital assets, and Scotland provides for no-fault divorce in the form of an “irretrievable breakdown of the marriage.” The reasons for this breakdown are similar to those in England and Wales.

In 2013, there were 126,716 divorces in the United Kingdom, which was a decrease of 2.9 percent from the previous year (ONS 2013a). The average age for divorce was between 40 and 44, but women were likelier to divorce at a younger age than men. Among women, those in their late twenties had the highest divorce rate, while men tended to divorce in their late thirties and early forties (ONS 2013a). In addition, almost half (48%) of the couples divorcing in 2013 had at least one child under the age of 16 (ONS 2013a).

Marriage and Sexuality

Marriages can occur anywhere in the United Kingdom, pursuant to the Marriage Act of 1994 that stated marriages could be solemnized in “approved premises.” Previously, there were only two avenues available: registry offices and churches (Marriage Act 1994).

As of 2004, the Gender Recognition Act allows transgender individuals to change their legal gender and marry. This allows individuals to get a new birth certificate and accords them all the protections under the law of that new gender (Gender Recognition Act 2004). Until 2013, when same-sex marriage was legalized in the United Kingdom, the act was somewhat controversial because it requires a couple who wish to remain together to divorce, or get an annulment, and then enter into a new marriage when the birth certificate has been issued. The act presupposes new marriages that would occur between same-sex couples, as these couples would be eligible to enter into civil partnerships under the Civil Partnership Act of 2004. The Equality and Human Rights Commission (EHRC) has recommended that marriages automatically convert into civil partnerships when one member of the couple obtains the gender recognition certificate (EHRC 2011). However, if you are married, the government does not require the marriage to be dissolved if the couple resides in England

or Wales, but it does require that the couple sign a declaration with their intent to stay married (Gender Recognition Act 2004).

Contraception

There are 15 types of free contraceptives available in the United Kingdom. Oral contraception became available to women on December 4, 1961, via the National Health Service, but it was not available to single women until 1974. Girls under the age of 16 can also get confidential advice and contraception without their parents' knowledge. Contraception is available to women and girls free of charge through the National Health Service and can be obtained through a GP, a community contraception clinic, or a sexual health clinic. There are permanent methods of contraception for women, which include female sterilization, but the majority of women and girls choose a pill form or injection form of contraception.

Politics

The United Kingdom consists of England, Scotland, Wales, and Northern Ireland. Three of the four parts of the United Kingdom—Wales, Scotland, and Northern Ireland—have their own limited system of self-government under devolution since 1998, where some powers were given when the three devolved governments were formed. Most governing occurs in the capital of the United Kingdom, London, with the Parliament. There are three main parties in the United Kingdom: the Conservative Party, the Labour Party, and the Liberal Democrats.

The Welsh government is known as the National Assembly for Wales, and it has the ability to make some legislation for Wales. This assembly was formed under the Government of Wales Act in 1998, established by the Labour government under Tony Blair (1953–). In the 2003 election, women received a full 50 percent of the seats in the assembly (Watt 2003). The National Assembly has 60 elected members, and the Welsh government is led by First Minister Carwyn Jones (1967–), a member of the Welsh Labour Party.

In Scotland, the government is under the control of the Scottish National Party, led by Nicola Sturgeon, but women make up only 34.9 percent of the total members of the current Parliament (Scottish Parliament 2016). The Scottish Parliament was created by the Scotland Act of 1998, giving it some powers to create legislation for Scotland, such

as control over health, education, and local government affairs.

The Northern Ireland Assembly members are elected from 18 constituencies. The First Minister and deputy First Minister share executive leadership of Northern Ireland. In January 2016, Arlene Foster from the Democratic Unionist Party became the first woman to hold the post of First Minister, serving alongside Martin McGuinness (1950–2017) from Sinn Féin as the deputy First Minister. In January 2017, facing ill health and a political scandal in which Foster refused to recuse herself from duty, McGuinness resigned in protest. Because the First Minister and deputy First Minister share power, his resignation removed Foster from office as well, leaving both positions vacant.

The head of the U.K. government is the prime minister. Teresa May has been prime minister since July 13, 2016, and is the second female prime minister of the United Kingdom. Margaret Thatcher (1925–2013), who served from 1979 until 1990, was the first. May replaced David Cameron, who had been in power since May 11, 2010, after a historic vote in the United Kingdom to leave the European Union, known as Brexit. May emphasized she was the head of the party known as the Conservative and Unionist Party and sought to keep strong ties with Scotland, Wales, and Northern Ireland to prevent the breakup of the United Kingdom. Her first official travel as prime minister was a visit to the Scottish leader, Nicola Sturgeon, the day after she became prime minister. Sturgeon (1940–) is the first female to be the first minister of Scotland and the Scottish National Party.

On June 23, 2016, the United Kingdom voted to leave the European Union by a majority of 52 percent to 48 percent in a vote known as “Brexit,” or Britain’s Exit. All 32 council areas in Scotland voted to remain with the European Union, however. Two years earlier, on September 18, 2014, Scotland had its own independence referendum when the voters in Scotland decided by a margin of 55.3 percent to 44.7 percent to remain within the United Kingdom.

Participation in Government

The primary way in which individuals participate in government is through voting. Voter turnout in the United Kingdom sits around 66 percent. In the May 2015 general election, 67 percent of men and 66 percent of women voted, illustrating there is little to no gender gap in voting (Ipsos MORI 2015). Overwhelmingly, older people participated at a greater rate than younger people, with

43 percent of the 18–24 age group participating versus 78 percent of the over 65 age group (Ipsos MORI 2015). The same pattern held true for women, with 44 percent of the 18–24 age group participating versus 76 percent of the over 55 age group (Ipsos MORI, 2015). Women's high voter participation has not translated into an equal share of women holding elected positions, which lags significantly behind men. Women were not eligible to become members of parliament until 1918, shortly after women over 30 gained suffrage. Only one in four members of parliament are women, with women being outnumbered five to one by men in the cabinet, and just 16 percent of senior ministerial posts are occupied by women (Fawcett Society 2013). Women express less interest in politics than men; one poll of 2,408 women found that only 30 percent are interested in politics, compared to 47 percent of men. Women's lack of interest may reflect their disaffection with the government, as the majority of women stated they do not believe their government represents their beliefs (Barnett 2012).

While women continue to work toward parity in representation in Parliament, they have shattered the glass ceiling in the United Kingdom, with the leaders of three areas, England, Scotland, and Northern Ireland, being women. In 2017, the leader of Scotland, known as the first minister of Scotland, was female: Nicole Sturgeon (1970–) of the Scottish National Party (SNP). She first became a member of the Scottish Parliament in 1999 and then the leader of Scotland on November 20, 2014, after serving as the deputy first minister for seven years, from 2007 until 2014. The leader of Northern Ireland, Arlene Foster (1970–), has been in power since January 2016, having previously served as the minister for finance and personnel.

Suffrage

Women in the United Kingdom have had a long battle to receive the vote. Women's exclusion from voting, however, was not always in place, with voting being popular for women until the 1832 Reform Act and the 1835 Municipal Corporations that specified only male persons should be allowed to vote (Heater 2006). This began an almost century-long fight for women to regain the right to vote that was marked by significant political discord and cultural upheaval.

The National Society for Women's Suffrage and the National Union of Women's Suffrage Societies were formed in 1872 and initially led the fight for women's suffrage. In 1906, the Women's Social and Political Union (WSPU)

was formed, and this organization began a militant campaign to gain women suffrage. These women were known as suffragettes. The campaign was marked by violent acts, such shouting, stone throwing, hunger strikes, and arson. According to some, these methods were unproductive (Pugh 2000). Others believe that the militant and violent aspect of the suffrage movement set it back. "For women to gain the right to vote it was necessary to demonstrate that they had public opinion on their side, to build and consolidate a parliamentary majority in favor of women's suffrage and to persuade or pressure the government to introduce its own franchise reform. None of these objectives was achieved" (Whitfield 2001, 152–160). The campaign for suffrage, however, was suspended with the outbreak of World War I in 1914, as with most other types of political activities.

Women fighting for suffrage achieved some success in 1918, when women over the age of 30 received the vote under the Representation of the People Act of 1918. At this time, men over the age of 21 and men who had served in World War I who were over the age of 19 could vote (Butler 1954). This same year, women became eligible to serve as members of parliament. Ten years later, pursuant to the Representation of the People Act of 1928, women over the age of 21 received the vote (Butler 1954). The voting age in the United Kingdom was lowered to age 18 in 1969, taking effect in 1970. Discussions to lower the voting age to 16 ensued, but these were largely unfruitful, with the exception of Scotland, which allows those over the age of 16 to vote in Scottish Parliament and Scottish local elections.

The movement for voting rights in the United Kingdom was headed by some important female role models. Emmeline Pankhurst was a prominent female figure in the suffrage movement. Pankhurst, along with her two daughters, Christabel and Sylvia, founded the Women's Social and Political Union (Atkinson 1992). Similar to many successful women fighting for voting rights at this time, she was supported by her husband, Richard. A second woman, Millicent Fawcett, was also an important figure in the suffrage movement, but she took a more peaceful stance. She thought women would be rewarded after World War I with suffrage for their support of the war (Crawford 1999). She also believed that women and their organizations should work together. Fawcett became president of the National Union of Women Suffrage Societies (NUWSS) to unite women behind one common cause. The women were ultimately successful, with universal suffrage for women being extended in 1928.

Structure of the Government

The United Kingdom is a constitutional monarchy with the current queen as the head of state. Although Queen Elizabeth II opens and closes Parliament, this is a ceremonial duty. She has little influence in the daily running of the government and largely remains neutral. Prior to forming a government, the prime minister must ask permission from the Crown, however.

The United Kingdom has a bicameral legislative branch, with the House of Lords composed of 780 seats, 667 of which are made up of life peers, 88 hereditary peers, and 25 clergy. There are no elections for the House of Lords. The second branch of the legislature is the House of Commons, with 650 seats. Members are elected by popular vote to serve five-year terms. The most recent election was held in June 2015, with the result of coalition between the Conservative Party and the Liberal Democrats.

The type of government is a parliamentary democracy, which means that members of government are also members of the House of Lords or House of Commons, and the government is directly accountable to the Parliament. The prime minister is the head of the government and is the leader of the party with the majority of seats in the House of Commons. The party chooses this leader, who is ultimately responsible for all government decisions. The primary running of the country is done by members of parliament who are elected every five years through popular vote.

The cabinet is made up of the senior members of the party, appointed by the prime minister, who meet every week to discuss important issues. These cabinet ministers include the Chancellor of the Exchequer, the Secretary for the Home Department, the Lord Chancellor, and the Secretary of State for Justice. In 2017, there were 21 members of the cabinet in addition to the prime minister, of which 7 are female, in addition to the prime minister. There were 96 other ministers chosen by the prime minister from the House of Commons and House of Lords who are responsible for the smooth running of their departments. Since 1918, 450 women have been elected as members of parliament, and in 2017, women constituted 30 percent (192) of all members of parliament.

While the main government is in London, there are other layers of local governments throughout England, Scotland, Wales, and Northern Ireland that are also elected by individuals in their constituencies. England contains 27 two-tier counties, 32 London boroughs, and 1 City of

London, 36 metropolitan districts, and 56 unitary authorities. Northern Ireland contains 13 borough councils, 11 district council areas, 1 city and district council, and 1 city council. Scotland has 32 council areas. Wales has 22 unitary authorities (CIA 2015).

Religious and Cultural Roles

Women and Religion

In the United Kingdom, laws and policies have long been in place to protect religious freedoms. The 1998 Human Rights Act provides for freedom of religion, and the 2006 and 2010 Equality Acts ban discrimination based on religion. Those who believe their religious freedom has been violated have the right to appeal to the courts for relief.

Everyone in the United Kingdom has the right to freely and openly practice their religion of choice. The census report of 2011 identified 59.3 million Christians, including members of the Church of England, Church of Scotland, and Church of Wales; Catholics; Protestants; and all other Christian denominations, which made up more than half of the total practicing population. Muslims and Hindus represented smaller percentages of those expressing affiliation with religious groups, and approximately 33 percent had unspecified or no declared religious affiliation (CIA 2015). Jews represented 0.5 percent of the population, according to the 2011 census report.

The reigning monarch is the “Supreme Governor” of the Church of England, who must be a member of and promise to uphold the church. While women have always played significant roles in the development and evangelization of religions and religious beliefs in the United Kingdom, it was only recently that they made strides in leadership roles. Historically, women were not allowed to participate in the church as clergy; they were permitted to serve as lay readers (also called Bishop Messengers) only in the absence of men. Since 1966, however, the movement to ordain women as deacons, priests, and bishops had been under discussion. On March 12, 1994, the first 32 women were ordained at Bristol Cathedral as Church of England priests, and by 2010, there were more female than male priests presiding over religious services. In a groundbreaking move, the 2013 Church of England’s General Synod voted in favor of ordaining female bishops, a huge win for women inclined to dedicate their lives to the church.

Today, more women than ever are instigating change within their respective faiths, paving the way for others, in an effort to improve the level of participation afforded

to women of faith. *The Guardian* reported in 2014 that the number of female full-time clergy in the Church of England had increased by 41 percent, from 1,262 to 1,781, between 2002 and 2012, while the number of full-time males dropped from 7,920 to 6,017. These statistics showed that women represented approximately one in five full-time clergy and just under half of part-time clergy. At that point, however, only 39 senior clergy members were female, compared to 319 males (Arnett 2014).

Women in the Media

The media in the United Kingdom includes national, local, and international outlets. There is also still a significant hardcopy newspaper presence. Tabloids include *The Sun* and the *Daily Mirror* as well as broadsheets such as the *Daily Telegraph*. Perhaps the most well-known news source is the British Broadcasting Corporation (BBC).

Since 2000, according to the Global Media Monitoring Project (GMMP), women have increased their presence in the news media, both in front and behind the camera. However, only 20 percent of women are asked to speak as experts (GMMP 2015). The study by the GMMP that looked at news media from 1995 until 2010 found that of the 431 individual announcers, only 32 percent (136) were female. In addition, separating out types of news media, the radio proved to be the least inclusive for women, with only 23 percent of the announcers and 21 percent of the reporters being women. Conversely, television was the most inclusive of women, with 50 percent of announcers and 34 percent of reporters being female (GMMP 2015). Looking at the type of reports female reports gave, women were twice as likely as men to write a story that contained a central female and were twice as likely to write stories challenging gender stereotypes (GMMP 2015). Women are vastly underrepresented in the expert opinion category, but they are overrepresented in the general, homemaker, parent, and wife categories. They often were asked for opinions on “women’s work,” such as health care, child care, or office work (GMMP 2015).

Sexism in television and the media still appears to be quite common in the United Kingdom, as in many countries of the world. A 2012 report titled *Just the Women*, compiled and produced by a coalition of women’s activist groups, claimed to have found evidence of “endemic sexism” in British newspapers (Eaves et al. 2012). After a close examination of 11 U.K. national newspapers’ portrayal of

women over a two-week period, recommendations were made on press-regulation reform to reduce discrimination against women. The findings revealed over 1,300 pieces of editorial and images that illustrated different forms of media sexism. Younger women were found to be the most visible but heavily stereotyped, while older, disabled, black, and other ethnic minority females were the least visible. In general, the report concluded, a lack of context in reporting leads to inaccurate or misrepresentative impressions of women’s lives and stereotyped coverage of women’s appearance and women’s issues.

In broad terms, the number of women working in the media has risen over the past few years. Television, in particular the Indie sector, has also increased dramatically according to the 2012 Creative Skillset Employment Census. The census collected information on the workforce between 2009 and 2012 and found that women represent 36 percent of the total. The number of women in production has also risen by a little over 10 percent, and in the Indie sector, women make up approximately 48 percent of the working population. While this trend may be an indicator that discrimination in the workplace is drawing more attention, women continue to work hard for equal treatment in and out of the public eye (Women in Film and Television UK 2013).

Issues LGBT Rights

Between 1967 and 1982, a series of regulations around same-sex sexual activity were decriminalized with increasing acceptance of lesbian, gay, bisexual, and transgender (LGBT) rights in the 21st century. Since 1999, there have been some protections for LGBT individuals against discrimination, but this was not extended to all areas until the passage of the Equality Act of 2010. Ten years prior, under the Labour government of Tony Blair, the armed forces removed its ban on LGBT individuals serving. The British military actively recruits gay and lesbian individuals, allowing individuals to march in naval uniform at gay pride events (Barr and Bannerman 2008).

Same-sex couples in the United Kingdom have had the right to enter into a civil partnership since 2005, with the right to adopt children for same-sex couples in England and Wales. Scotland followed suit in 2009 and Northern Ireland in 2013. Same-sex marriage has been legal in England, Scotland, and Wales since 2014; only Northern Ireland retains civil partnerships.

The Adoption and Children Act of 2002 allowed single people and couples to adopt and removed the requirement that the couple be married, opening the door for same-sex couples to adopt (who at that time could not legally enter into a partnership). Children born during a legal same-sex marriage are the children of both parents, even though only one parent is biologically related to that child, under the Human Fertilization and Embryology Act of 2008.

Violence against Women

“Violence against women remains a pervasive challenge for the United Kingdom and a more comprehensive and targeted response is needed to address the scourge,” said an independent UN human rights special reporter in April 2014, after a two-week mission to the country (UN News Centre 2014). In a news release issued at the end of her mission, the expert pointed out that, in the prior year alone, 7 percent of women in England and Wales reported having experienced some type of domestic violence, and 2.5 percent of women reported having been sexually assaulted. Other types of violence reported included sexual harassment, gender-based bullying, forced or early marriages, female genital mutilation (FGM), gang-related violence, so-called honor-related violence, and human trafficking. Women’s organizations also point out that black and minority ethnic women experience a higher rate of domestic homicide and that Asian women are more likely to commit suicide than other ethnic groups as a result of violence. Women, in general, are also more likely to suffer repeated forms of violence than men.

Domestic Violence

The All-Party Parliamentary Group (APPG) on Domestic and Sexual Violence released a report revealing that the criminal justice system continues to fail women who experience domestic violence. Many women experiencing domestic violence, including sexual violence in intimate relationships, do not have adequate access to justice, and the criminal justice system frequently fails to hold perpetrators of domestic violence accountable. When sanctions are imposed, they are often so limited and the violence so pervasive that perpetrators are able to continue abusing their victims. Eighty-nine percent of respondents to the APPG study felt that women faced barriers to disclosing domestic violence to the police or other criminal justice agencies. Further, when the criminal justice system fails

to respond appropriately to incidents of violence against women, the violence can often lead to death (Women’s Aid 2014).

According to statistics reported on the Web site of Women’s Aid, a national organization established to address and help end the violence against women and children, over two women per week are killed by current or former partners, and one in four women will experience domestic violence in her lifetime. Regardless of age, social class, race, disability, or lifestyle, domestic violence against women continues to be prevalent and accounts for 16–25 percent of all recorded violent crime. Domestic violence is not confined to heterosexual relationships; it is also reported in gay, lesbian, bisexual, and transgender relationships and within extended families.

Trafficking

Human trafficking has become a multi-billion-dollar industry, and only 1 person is convicted for every 800 trafficking cases worldwide. According to Catholic Relief Services (CRS), there are 12.3 million people trafficked in 161 countries (Catholic Relief Services 2014). The United Kingdom has adopted the UN Protocol to Prevent, Suppress and Punish the Trafficking in Persons, which is a supplement to the UN Convention against National Organized Crime. An assessment compiled by the United Kingdom Human Trafficking Centre (UKHTC) for 2012 revealed some alarming facts: 2,255 potential victims of human trafficking were encountered in 2012, up 9 percent from 2011 estimates; of these, 71 percent were adults, and 24 percent were children (SOCA 2013).

The two most commonly reported exploitation types were forced labor and sexual exploitation. Forced labor can occur in any industry, but hospitality, agriculture, food packaging, and construction were ranked as particularly vulnerable. Sexual exploitation is defined as being coerced physically, threatened verbally, or groomed psychologically for sexual acts, including prostitution, the creation of pornography, and involvement in ritual abuse. Trafficking for sexual exploitation does not only include people brought into the United Kingdom, but also U.K. citizens who are moved from one location to another within Britain. Women were overwhelmingly the most prevalent in this category; however, children as young as three years old have been trafficked to the United Kingdom for sexual exploitation.

Primary Documents

Constitution of the United States of America

Delegates to the Constitutional Convention in Philadelphia signed the U.S. Constitution on September 17, 1787. While the Constitution provided for a stronger federal government and basic individual protections, its rights did not apply equally to everyone. Slavery was not abolished until the Thirteenth Amendment was ratified in 1865. In 1870, the Fifteenth Amendment was ratified; it prevented denying men the right to vote on account of race, color, or previous condition of servitude. Women did not receive the right to vote until the Nineteenth Amendment was ratified in 1920. In 1923, the National Women's Party introduced the Equal Rights Amendment: "Equality of rights under the law shall not be abridged by the United States or by any State on account of sex." It has still not been ratified, and so the U.S. Constitution to this day does not guarantee equal rights for women.

Political Participation and Freedom of Association:

The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex. Congress shall have power to enforce this article by appropriate legislation (Nineteenth Amendment).

Status of Religious or Customary Law:

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances. (First Amendment)

Constitution of Ireland

Ireland became independent from the United Kingdom in December 1922 and issued the Constitution of the Irish Free State, which was replaced by the current constitution in 1937. Many Irish felt the original constitution was too closely linked to British rule and wanted to ensure a thoroughly Irish document. The constitutions set out as fundamental rights equality before the law, right to life, personal liberty, freedom of expression, assembly and association, bodily integrity, religious liberty, and the inviolability of a citizen's dwelling, among others.

Article 40

1. All citizens shall, as human persons, be held equal before the law. This shall not be held to mean that the State shall not in its enactments have due regard to differences of capacity, physical and moral, and of social function.

Article 41

1.

1 The State recognises the Family as the natural primary and fundamental unit group of Society, and as a moral institution possessing inalienable and imprescriptible rights, antecedent and superior to all positive law.

2 The State, therefore, guarantees to protect the Family in its constitution and authority, as the necessary basis of social order and as indispensable to the welfare of the Nation and the State.

2.

1 In particular, the State recognises that by her life within the home, woman gives to the State a support without which the common good cannot be achieved.

2 The State shall, therefore, endeavour to ensure that mothers shall not be obliged by economic necessity to engage in labour to the neglect of their duties in the home.

3.

1 The State pledges itself to guard with special care the institution of Marriage, on which the Family is founded, and to protect it against attack.

Basic Law for the Federal Republic of Germany

The Western Allies of World War II signed Germany's constitution, Basic Law for the Federal Republic of Germany, in 1949. At the time, it applied only to what was then known as West Germany, but with reunification in 1990, it became the constitution for the whole of Germany. The framers were especially concerned that the Basic Law ensured another dictator like Hitler would not arise. Additionally, the document offers a clear focus on human rights and human dignity.

Article 3

(1) All persons shall be equal before the law.

(2) Men and women shall have equal rights. The state shall promote the actual implementation of equal rights for women and men and take steps to eliminate disadvantages that now exist.

(3) No person shall be favoured or disfavoured because of sex, parentage, race, language, homeland and origin, faith, or religious or political opinions. No person shall be disfavoured because of disability.

Article 6

(1) Marriage and the family shall enjoy the special protection of the state.

(2) The care and upbringing of children is the natural right of parents and a duty primarily incumbent upon them. The state shall watch over them in the performance of this duty.

(3) Children may be separated from their families against the will of their parents or guardians only pursuant to a law, and only if the parents or guardians fail in their duties or the children are otherwise in danger of serious neglect.

(4) Every mother shall be entitled to the protection and care of the community.

(5) Children born outside of marriage shall be provided by legislation with the same opportunities for physical and mental development and for their position in society as are enjoyed by those born within marriage.

Constitution of India

The Constituent Assembly adopted India's Constitution in 1949, and it came into effect in January 1950. Until 1947, India was under British rule. The Constitution repealed the Indian Independence Act and made India a sovereign nation. The Constitution declares India to be a secular, democratic republic and guarantees its citizens justice, equality, and liberty.

39. Certain principles of policy to be followed by the State.—The State shall, in particular, direct its policy towards securing—

(a) that the citizens, men and women equally, have the right to an adequate means of livelihood;

(b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good;

(c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment;

(d) that there is equal pay for equal work for both men and women;

(e) that the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength;

(f) that children are given opportunities and facilities to develop in a healthy manner and in conditions of freedom and dignity and that childhood and youth are protected against exploitation and against moral and material abandonment.

...

15. Prohibition of discrimination on grounds of religion, race, caste, sex or place of birth.—(1) The State shall not discriminate against any citizen on grounds only of religion, race, caste, sex, place of birth or any of them.

(2) No citizen shall, on grounds only of religion, race, caste, sex, place of birth or any of them, be subject to any disability, liability, restriction or condition with regard to—

(a) access to shops, public restaurants, hotels and places of public entertainment; or

(b) the use of wells, tanks, bathing ghats, roads and places of public resort maintained wholly or partly out of State funds or dedicated to the use of the general public.

(3) Nothing in this article shall prevent the State from making any special provision for women and children.

Convention on the Elimination of All Forms of Discrimination against Women

The Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) was adopted by the UN General Assembly in 1979. It has been ratified by 189 nations, although the United States has not done so. Other nations have ratified the document with declarations, reservations, and objections. Iran, Somalia, Sudan, Tonga, and the Holy See have not signed on to the document. The document is an international bill of rights for women that defines discrimination against women and offers an agenda to end discrimination. The nations that have ratified the document

have committed themselves to taking a number of steps to end discrimination against women, including incorporating equality into their legal systems and creating institutions to ensure equality for women.

The States Parties to the present Convention,

Noting that the Charter of the United Nations reaffirms faith in fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women,

Noting that the Universal Declaration of Human Rights affirms the principle of the inadmissibility of discrimination and proclaims that all human beings are born free and equal in dignity and rights and that everyone is entitled to all the rights and freedoms set forth therein, without distinction of any kind, including distinction based on sex,

Noting that the States Parties to the International Covenants on Human Rights have the obligation to ensure the equal rights of men and women to enjoy all economic, social, cultural, civil and political rights,

Considering the international conventions concluded under the auspices of the United Nations and the specialized agencies promoting equality of rights of men and women,

Noting also the resolutions, declarations and recommendations adopted by the United Nations and the specialized agencies promoting equality of rights of men and women,

Concerned, however, that despite these various instruments extensive discrimination against women continues to exist,

Recalling that discrimination against women violates the principles of equality of rights and respect for human dignity, is an obstacle to the participation of women, on equal terms with men, in the political, social, economic and cultural life of their countries, hampers the growth of the prosperity of society and the family and makes more difficult the full development of the potentialities of women in the service of their countries and of humanity,

Concerned that in situations of poverty women have the least access to food, health, education, training and opportunities for employment and other needs,

Convinced that the establishment of the new international economic order based on equity and justice will contribute significantly towards the promotion of equality between men and women,

Emphasizing that the eradication of apartheid, all forms of racism, racial discrimination, colonialism,

neo-colonialism, aggression, foreign occupation and domination and interference in the internal affairs of States is essential to the full enjoyment of the rights of men and women,

Affirming that the strengthening of international peace and security, the relaxation of international tension, mutual co-operation among all States irrespective of their social and economic systems, general and complete disarmament, in particular nuclear disarmament under strict and effective international control, the affirmation of the principles of justice, equality and mutual benefit in relations among countries and the realization of the right of peoples under alien and colonial domination and foreign occupation to self-determination and independence, as well as respect for national sovereignty and territorial integrity, will promote social progress and development and as a consequence will contribute to the attainment of full equality between men and women,

Convinced that the full and complete development of a country, the welfare of the world and the cause of peace require the maximum participation of women on equal terms with men in all fields,

Bearing in mind the great contribution of women to the welfare of the family and to the development of society, so far not fully recognized, the social significance of maternity and the role of both parents in the family and in the upbringing of children, and aware that the role of women in procreation should not be a basis for discrimination but that the upbringing of children requires a sharing of responsibility between men and women and society as a whole,

Aware that a change in the traditional role of men as well as the role of women in society and in the family is needed to achieve full equality between men and women,

Determined to implement the principles set forth in the Declaration on the Elimination of Discrimination against Women and, for that purpose, to adopt the measures required for the elimination of such discrimination in all its forms and manifestations,

Have agreed on the following:

Part I

Article 1

For the purposes of the present Convention, the term "discrimination against women" shall mean any

distinction, exclusion or restriction made on the basis of sex which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on a basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field.

Article 2

States Parties condemn discrimination against women in all its forms, agree to pursue by all appropriate means and without delay a policy of eliminating discrimination against women and, to this end, undertake:

(a) To embody the principle of the equality of men and women in their national constitutions or other appropriate legislation if not yet incorporated therein and to ensure, through law and other appropriate means, the practical realization of this principle;

(b) To adopt appropriate legislative and other measures, including sanctions where appropriate, prohibiting all discrimination against women;

(c) To establish legal protection of the rights of women on an equal basis with men and to ensure through competent national tribunals and other public institutions the effective protection of women against any act of discrimination;

(d) To refrain from engaging in any act or practice of discrimination against women and to ensure that public authorities and institutions shall act in conformity with this obligation;

(e) To take all appropriate measures to eliminate discrimination against women by any person, organization or enterprise;

(f) To take all appropriate measures, including legislation, to modify or abolish existing laws, regulations, customs and practices which constitute discrimination against women;

(g) To repeal all national penal provisions which constitute discrimination against women.

Article 3

States Parties shall take in all fields, in particular in the political, social, economic and cultural fields, all appropriate measures, including legislation, to ensure the full development and advancement of women, for the purpose of guaranteeing them the exercise and enjoyment

of human rights and fundamental freedoms on a basis of equality with men.

Article 4

1. Adoption by States Parties of temporary special measures aimed at accelerating de facto equality between men and women shall not be considered discrimination as defined in the present Convention, but shall in no way entail as a consequence the maintenance of unequal or separate standards; these measures shall be discontinued when the objectives of equality of opportunity and treatment have been achieved.

2. Adoption by States Parties of special measures, including those measures contained in the present Convention, aimed at protecting maternity shall not be considered discriminatory.

Article 5

States Parties shall take all appropriate measures:

(a) To modify the social and cultural patterns of conduct of men and women, with a view to achieving the elimination of prejudices and customary and all other practices which are based on the idea of the inferiority or the superiority of either of the sexes or on stereotyped roles for men and women;

(b) To ensure that family education includes a proper understanding of maternity as a social function and the recognition of the common responsibility of men and women in the upbringing and development of their children, it being understood that the interest of the children is the primordial consideration in all cases.

Article 6

States Parties shall take all appropriate measures, including legislation, to suppress all forms of traffic in women and exploitation of prostitution of women.

Part II

Article 7

States Parties shall take all appropriate measures to eliminate discrimination against women in the political and public life of the country and, in particular, shall ensure to women, on equal terms with men, the right:

(a) To vote in all elections and public referenda and to be eligible for election to all publicly elected bodies;

(b) To participate in the formulation of government policy and the implementation thereof and to hold public office and perform all public functions at all levels of government;

(c) To participate in non-governmental organizations and associations concerned with the public and political life of the country.

Article 8

States Parties shall take all appropriate measures to ensure to women, on equal terms with men and without any discrimination, the opportunity to represent their Governments at the international level and to participate in the work of international organizations.

Article 9

1. States Parties shall grant women equal rights with men to acquire, change or retain their nationality. They shall ensure in particular that neither marriage to an alien nor change of nationality by the husband during marriage shall automatically change the nationality of the wife, render her stateless or force upon her the nationality of the husband.

2. States Parties shall grant women equal rights with men with respect to the nationality of their children.

Part III

Article 10

States Parties shall take all appropriate measures to eliminate discrimination against women in order to ensure to them equal rights with men in the field of education and in particular to ensure, on a basis of equality of men and women:

(a) The same conditions for career and vocational guidance, for access to studies and for the achievement of diplomas in educational establishments of all categories in rural as well as in urban areas; this equality shall be ensured in pre-school, general, technical, professional and higher technical education, as well as in all types of vocational training;

(b) Access to the same curricula, the same examinations, teaching staff with qualifications of the same standard and school premises and equipment of the same quality;

(c) The elimination of any stereotyped concept of the roles of men and women at all levels and in all forms of education by encouraging coeducation and other types of education which will help to achieve this aim and, in particular, by the revision of textbooks and school programmes and the adaptation of teaching methods;

(d) The same opportunities to benefit from scholarships and other study grants;

(e) The same opportunities for access to programmes of continuing education, including adult and functional literacy programmes, particularly those aimed at reducing, at the earliest possible time, any gap in education existing between men and women;

(f) The reduction of female student drop-out rates and the organization of programmes for girls and women who have left school prematurely;

(g) The same Opportunities to participate actively in sports and physical education;

(h) Access to specific educational information to help to ensure the health and well-being of families, including information and advice on family planning.

Article 11

1. States Parties shall take all appropriate measures to eliminate discrimination against women in the particular:

(a) The right to work as an inalienable right of all human beings;

(b) The right to the same employment opportunities, including the application of the same criteria for selection in matters of employment;

(c) The right to free choice of profession and employment, the right to promotion, job security and all benefits and conditions of service and the right to receive vocational training and retraining, including apprenticeships, advanced vocational training and recurrent training;

(d) The right to equal remuneration, including benefits, and to equal treatment in respect of work of equal value, as well as equality of treatment in the evaluation of the quality of work;

(e) The right to social security, particularly in cases of retirement, unemployment, sickness, invalidity and old age and other incapacity to work, as well as the right to paid leave;

(f) The right to protection of health and to safety in working conditions, including the safeguarding of the function of reproduction.

2. In order to prevent discrimination against women on the grounds of marriage or maternity and to ensure their effective right to work, States Parties shall take appropriate measures:

(a) To prohibit, subject to the imposition of sanctions, dismissal on the grounds of pregnancy or of maternity leave and discrimination in dismissals on the basis of marital status;

(b) To introduce maternity leave with pay or with comparable social benefits without loss of former employment, seniority or social allowances;

(c) To encourage the provision of the necessary supporting social services to enable parents to combine family obligations with work responsibilities and participation in public life, in particular through promoting the establishment and development of a network of child-care facilities;

(d) To provide special protection to women during pregnancy in types of work proved to be harmful to them.

3. Protective legislation relating to matters covered in this article shall be reviewed periodically in the light of scientific and technological knowledge and shall be revised, repealed or extended as necessary.

Article 12

1. States Parties shall take all appropriate measures to eliminate discrimination against women in the field of health care in order to ensure, on a basis of equality of men and women, access to health care services, including those related to family planning.

2. Notwithstanding the provisions of paragraph 1 of this article, States Parties shall ensure to women appropriate services in connection with pregnancy, confinement and the post-natal period, granting free services where necessary, as well as adequate nutrition during pregnancy and lactation.

Article 13

States Parties shall take all appropriate measures to eliminate discrimination against women in other areas of economic and social life in order to ensure, on a basis of equality of men and women, the same rights, in particular:

(a) The right to family benefits;

(b) The right to bank loans, mortgages and other forms of financial credit;

(c) The right to participate in recreational activities, sports and all aspects of cultural life.

Article 14

1. States Parties shall take into account the particular problems faced by rural women and the significant roles which rural women play in the economic survival of their families, including their work in the non-monetized sectors of the economy, and shall take all appropriate measures to ensure the application of the provisions of the present Convention to women in rural areas.

2. States Parties shall take all appropriate measures to eliminate discrimination against women in rural areas in order to ensure, on a basis of equality of men and women, that they participate in and benefit from rural development and, in particular, shall ensure to such women the right:

- (a) To participate in the elaboration and implementation of development planning at all levels;
- (b) To have access to adequate health care facilities, including information, counselling and services in family planning;
- (c) To benefit directly from social security programmes;
- (d) To obtain all types of training and education, formal and non-formal, including that relating to functional literacy, as well as, inter alia, the benefit of all community and extension services, in order to increase their technical proficiency;
- (e) To organize self-help groups and co-operatives in order to obtain equal access to economic opportunities through employment or self employment;
- (f) To participate in all community activities;
- (g) To have access to agricultural credit and loans, marketing facilities, appropriate technology and equal treatment in land and agrarian reform as well as in land resettlement schemes;
- (h) To enjoy adequate living conditions, particularly in relation to housing, sanitation, electricity and water supply, transport and communications.

Part IV

Article 15

1. States Parties shall accord to women equality with men before the law.

2. States Parties shall accord to women, in civil matters, a legal capacity identical to that of men and the same opportunities to exercise that capacity. In particular, they shall give women equal rights to conclude contracts and to administer property and shall treat them equally in all stages of procedure in courts and tribunals.

3. States Parties agree that all contracts and all other private instruments of any kind with a legal effect which is directed at restricting the legal capacity of women shall be deemed null and void.

4. States Parties shall accord to men and women the same rights with regard to the law relating to the movement of persons and the freedom to choose their residence and domicile.

Article 16

1. States Parties shall take all appropriate measures to eliminate discrimination against women in all matters relating to marriage and family relations and in particular shall ensure, on a basis of equality of men and women:

- (a) The same right to enter into marriage;
- (b) The same right freely to choose a spouse and to enter into marriage only with their free and full consent;
- (c) The same rights and responsibilities during marriage and at its dissolution;
- (d) The same rights and responsibilities as parents, irrespective of their marital status, in matters relating to their children; in all cases the interests of the children shall be paramount;
- (e) The same rights to decide freely and responsibly on the number and spacing of their children and to have access to the information, education and means to enable them to exercise these rights;
- (f) The same rights and responsibilities with regard to guardianship, wardship, trusteeship and adoption of children, or similar institutions where these concepts exist in national legislation; in all cases the interests of the children shall be paramount;
- (g) The same personal rights as husband and wife, including the right to choose a family name, a profession and an occupation;
- (h) The same rights for both spouses in respect of the ownership, acquisition, management, administration, enjoyment and disposition of property, whether free of charge or for a valuable consideration.

2. The betrothal and the marriage of a child shall have no legal effect, and all necessary action, including legislation, shall be taken to specify a minimum age for marriage and to make the registration of marriages in an official registry compulsory.

Resolution on Ordination and the Role of Women in Ministry

As Southern Baptists in the United States debated the roles of women in church, home, and society during the 1980s, the issue of ordination for women arose as a key point of contention as more progressive churches ordained women. In 1984, conservatives led the Southern Baptist Convention to adopt a resolution claiming that the role of pastor is reserved for men. However, because ordination is a practice of the local church, more progressive churches continued to ordain women, despite the convention's statement. By the mid-1990s, many progressive churches began to leave the Southern Baptist Convention to form other organizations that supported women's ordination, as well as less literal readings of the Bible and more involvement in social justice issues by the churches.

WHEREAS, We, the messengers to the Southern Baptist Convention meeting in Kansas City, June 12–14, 1984, recognize the authority of Scripture in all matters of faith and practice including the autonomy of the local church; and

WHEREAS, The New Testament enjoins all Christians to proclaim the gospel; and

WHEREAS, The New Testament churches as a community of faith recognized God's ordination and anointing of some believers for special ministries (e.g., 1 Timothy 2:7; Titus 1:15) and in consequence of their demonstrated loyalty to the gospel, conferred public blessing and engaged in public dedicatory prayer setting them apart for service; and

WHEREAS, The New Testament does not mandate that all who are divinely called to ministry be ordained; and

WHEREAS, In the New Testament, ordination symbolizes spiritual succession to the world task of proclaiming and extending the gospel of Christ, and not a sacramental transfer of unique divine grace that perpetuates apostolic authority; and

WHEREAS, The New Testament emphasizes the equal dignity of men and women (Gal. 3:28) and that the Holy Spirit was at Pentecost divinely outpoured on men and women alike (Acts 2:17); and

WHEREAS, Women as well as men prayed and prophesied in public worship services (1 Cor. 11:2–16), and Priscilla joined her husband in teaching Apollos (Acts 18:26), and women fulfilled special church service-ministries as exemplified by Phoebe whose work Paul tributes as that of a servant of the church (Rom. 16:1); and

WHEREAS, The Scriptures attest to God's delegated order of authority (God the head of Christ, Christ the

head of man, man the head of woman, man and woman dependent one upon the other to the glory of God) distinguishing the roles of men and women in public prayer and prophecy (1 Cor. 11:2–5); and

WHEREAS, The Scriptures teach that women are not in public worship to assume a role of authority over men lest confusion reign in the local church (1 Cor. 14:33–36); and

WHEREAS, While Paul commends women and men alike in other roles of ministry and service (Titus 2:1–10), he excludes women from pastoral leadership (1 Tim. 2:12) to preserve a submission God requires because the man was first in creation and the woman was first in the Edenic fall (1 Tim. 2:13ff); and

WHEREAS, These Scriptures are not intended to stifle the creative contribution of men and women as co-workers in many roles of church service, both on distant mission fields and in domestic ministries, but imply that women and men are nonetheless divinely gifted for distinctive areas of evangelical engagement; and

WHEREAS, Women are held in high honor for their unique and significant contribution to the advancement of Christ's kingdom, and the building of godly homes should be esteemed for its vital contribution to developing personal Christian character and Christlike concern for others.

Therefore, be it RESOLVED, That we not decide concerns of Christians doctrine and practice by modern cultural, sociological, and ecclesiastical trends or by emotional factors; that we remind ourselves of the dearly bought Baptist principle of the final authority of Scripture in matters of faith and conduct; and that we encourage the service of women in all aspects of church life and work other than pastoral functions and leadership roles entailing ordination.

African Charter on Human and Peoples' Rights

The African Charter on Human and Peoples' Rights (Banjul Charter) became effective in 1986. It was developed under the Organization of African Unity (now replaced by the African Union) as a tool to promote human rights across the continent. The charter recognizes civil and political rights, as well as the right to work, the right to health, and the right to education. The charter also recognizes group rights and the right of the family to protection by the state.

Article 2

Every individual shall be entitled to the enjoyment of the rights and freedoms recognized and guaranteed in the present Charter without distinction of any kind such as race, ethnic group, color, sex, language, religion, political or any other opinion, national and social origin, fortune, birth or other status.

Article 3

1. Every individual shall be equal before the law.
2. Every individual shall be entitled to equal protection of the law.

Article 4

Human beings are inviolable. Every human being shall be entitled to respect for his life and the integrity of his person. No one may be arbitrarily deprived of this right.

Article 5

Every individual shall have the right to the respect of the dignity inherent in a human being and to the recognition of his legal status. All forms of exploitation and degradation of man particularly slavery, slave trade, torture, cruel, inhuman or degrading punishment and treatment shall be prohibited.

Article 8

Freedom of conscience, the profession and free practice of religion shall be guaranteed. No one may, subject to law and order, be submitted to measures restricting the exercise of these freedoms.

Article 15

Every individual shall have the right to work under equitable and satisfactory conditions, and shall receive equal pay for equal work.

Article 18

The family shall be the natural unit and basis of society. It shall be protected by the State which shall take care of its physical health and moral.

The State shall have the duty to assist the family which is the custodian of morals and traditional values recognized by the community.

The State shall ensure the elimination of every discrimination against women and also ensure the protection of

the rights of women and the child as stipulated in international declarations and conventions.

The aged and the disabled shall also have the right to special measures of protection in keeping with their physical or moral needs.

Constitution of the Republic of the Philippines, 1987

The 1987 Philippine Constitution came into being when President Corazon C. Aquino overturned a number of the provisions that were part of the 1973 constitution adopted during the regime of dictator Ferdinand Marcos. Faced with opposition for his corruption, Marcos called a “snap election” in 1985, and Corazon ran against him. The official election canvasser declared Marcos the winner, but another poll-watching group claimed Aquino had more votes. When Aquino supporters overran Manila, Marcos fled, and the United States provided him with passage to Hawaii. Under Aquino, the country adopted a new constitution that provided for fundamental equality between women and men.

Employment:

Section 14. The State shall protect working women by providing safe and healthful working conditions, taking into account their maternal functions, and such facilities and opportunities that will enhance their welfare and enable them to realize their full potential in the service of the nation. (Art. XIII)

Equal before the Law:

Section 14: The State recognizes the role of women in nation-building, and shall ensure the fundamental equality before the law of women and men. (Art. II)

General Human Rights Guarantees:

Section 11. The State values the dignity of every human person and guarantees full respect for human rights. (Art. II)

Marriage:

Section 12: The State recognizes the sanctity of family life and shall protect and strengthen the family as a basic autonomous social institution. It shall equally protect the

life of the mother and the life of the unborn from conception. The natural and primary right and duty of parents in the rearing of the youth for civic efficiency and the development of moral character shall receive the support of the Government. (Art. II)

Section 1. The State recognizes the Filipino family as the foundation of the nation. Accordingly, it shall strengthen its solidarity and actively promote its total development.

Section 2. Marriage, as an inviolable social institution, is the foundation of the family and shall be protected by the State.

Section 3. The State shall defend:

1. The right of spouses to found a family in accordance with their religious convictions and the demands of responsible parenthood;

2. The right of children to assistance, including proper care and nutrition, and special protection from all forms of neglect, abuse, cruelty, exploitation and other conditions prejudicial to their development;

3. The right of the family to a family living wage and income; and

4. The right of families or family associations to participate in the planning and implementation of policies and programs that affect them. Section 4. The family has the duty to care for its elderly members but the State may also do so through just programs of social security. (Art. XV)

Public Authorities Institutions and Services:

Section 11. The State shall adopt an integrated and comprehensive approach to health development which shall endeavor to make essential goods, health and other social services available to all the people at affordable cost. There shall be priority for the needs of the under-privileged, sick, elderly, disabled, women, and children. The State shall endeavor to provide free medical care to paupers. (Art. XIII)

Women of the Wall Mission Statement

The Western Wall (or Wailing Wall, or Kotel) in Jerusalem is the most sacred Jewish site for prayer, but since 1967, women and men have been segregated at the Wall. Women may not pray there in groups or with Torah scrolls or aloud. Women of the Wall, a group dedicated to the free prayer of women

at the Western Wall, began prayer together at the Wall in 1988 and have since struggled for women's equal rights at the Western Wall.

As Women of the Wall, our central mission is to achieve the social and legal recognition of our right, as women, to wear prayer shawls, pray and read from the Torah collectively and out loud at the Western Wall.

We work to further our mission through social advocacy, education and empowerment.

In our social advocacy work, we aim to change the status-quo that is currently preventing women from being able to pray freely at the Western Wall. This goal has great ramifications for women's rights in Judaism and in Israel and must be achieved through social advocacy in order to raise awareness and change the social perception of these issues.

We take it upon ourselves to educate Jewish women and the public about the social, political and personal ramifications of limiting and eliminating women's right to pray as a group at a holy site. When the law and the society literally, publicly and deliberately silence women in prayer, it is a violation of civil rights, human rights and religious freedoms. Education is the key to changing perspectives, laws and lives.

Every time we meet to pray, we empower and encourage Jewish women to embrace religion freely, in their own way. We stand proudly and strongly in the forefront of the movement for religious pluralism in Israel, in the hopes to inspire and empower women from all over the world and across the spectrum of Jewish movements to find their spiritual voice.

With this great mission before us, our vision is to strengthen and expand our organization, to reach out and influence policy makers and leaders, to demand full access to prayer at the Western Wall for women. In addition, Women of the Wall works to expand our network of allies and partners around the world who will advocate and take action with us.

Rule 93. Rape and Other Forms of Sexual Violence

Rule 93 comes from the rules of customary international humanitarian law identified by the International

Committee of the Red Cross (ICRC). This rule is part of the chapter on fundamental guarantees that apply to all civilians during armed conflicts. According to the ICRC, human rights law applies even during conflict, except in a limited set of circumstances during a time of national emergency. Even then, certain rights may never be breached, including freedom from rape and other forms of sexual violence.

International and Non-international Armed Conflicts

The prohibition of rape under international humanitarian law was already recognized in the Lieber Code. [1] While common Article 3 of the Geneva Conventions does not explicitly mention rape or other forms of sexual violence, it prohibits “violence to life and person” including cruel treatment and torture and “outrages upon personal dignity”. [2] The Third Geneva Convention provides that prisoners of war are in all circumstances entitled to “respect for their persons and their honour”. [3] The prohibition of “outrages upon personal dignity” is recognized in Additional Protocols I and II as a fundamental guarantee for civilians and persons hors de combat. [4] Article 75 of Additional Protocol I specifies that this prohibition covers in particular “humiliating and degrading treatment, enforced prostitution and any form of indecent assault”, while Article 4 of Additional Protocol II specifically adds “rape” to this list. [5] The Fourth Geneva Convention and Additional Protocol I require protection for women and children against rape, enforced prostitution or any other form of indecent assault. [6] Rape, enforced prostitution and any form of indecent assault are war crimes under the Statutes of the International Criminal Tribunal for Rwanda and of the Special Court for Sierra Leone. [7] The expressions “outrages upon personal dignity” and “any form of indecent assault” refer to any form of sexual violence. Under the Statute of the International Criminal Court, “committing rape, sexual slavery, enforced prostitution, forced pregnancy . . . enforced sterilization, or any other form of sexual violence” also constituting a grave breach of the Geneva Conventions or also constituting a serious violation of common Article 3 of the Geneva Conventions constitutes a war crime in international and non-international armed conflicts respectively. [8] Furthermore, “rape, sexual slavery, enforced prostitution, forced pregnancy, enforced sterilization, or any other form of sexual violence of comparable gravity” constitutes a crime against humanity under the Statute of the International Criminal Court and “rape” constitutes a crime against humanity under the

Statutes of the International Criminal Tribunals for the former Yugoslavia and Rwanda. [9]

Numerous military manuals state that rape, enforced prostitution and indecent assault are prohibited and many of them specify that these acts are war crimes. [10] The legislation of many States provides that rape and other forms of sexual violence are war crimes. [11] National case-law has confirmed that rape constitutes a war crime, as early as 1946 in the Takashi Sakai case before the War Crimes Military Tribunal of the Chinese Ministry of National Defence. [12] In the John Schultz case in 1952, the US Court of Military Appeals held that rape was a “crime universally recognized as properly punishable under the law of war”. [13]

Violations of the prohibition of rape and other forms of sexual violence have been widely condemned by States and international organizations. [14] For example, the UN Security Council, UN General Assembly and UN Commission on Human Rights condemned the sexual violence that occurred during the conflicts in Rwanda, Sierra Leone, Uganda and the former Yugoslavia. [15] The European Parliament, Council of Europe and Gulf Cooperation Council have condemned rape in the former Yugoslavia as a war crime. [16] It is significant that in 1993 Yugoslavia acknowledged in its report to the Committee on the Elimination of Discrimination Against Women that abuses of women in war zones were crimes contrary to international humanitarian law and apologized for an earlier statement giving the false impression that rape was considered normal behaviour in times of war. [17]

Sexual violence is prohibited under human rights law primarily through the prohibition of torture and cruel, inhuman or degrading treatment or punishment. Thus, both the European Court of Human Rights and the Inter-American Commission on Human Rights have, in their case-law, found instances of rape of detainees to amount to torture. [18] The European Court of Human Rights has also found the strip-searching of a male prisoner in the presence of a female prison officer to be degrading treatment. [19] The Committee on the Elimination of Discrimination Against Women stated in a General Recommendation that discrimination includes gender-based violence. [20] There is also an increasing number of treaties and other international instruments which state that trafficking in women and children for the purpose of prostitution is a criminal offence, [21] as well as an increased recognition of the need to punish all persons responsible for sexual violence. [22] The prohibition of using sexual violence as an official punishment is clear; not only is such

a punishment not officially provided for by States, but also any confirmed reports of such an incident have either been denied or the relevant persons prosecuted.[23]

Definition of Rape

With respect to the definition of rape, the International Criminal Tribunal for the former Yugoslavia considered in its judgment in the *Furundžija* case in 1998 that rape required “coercion or force or threat of force against the victim or a third person”.[24] In its later case-law in the *Kunarac* case in 2001, however, the Tribunal considered that there might be other factors “which would render an act of sexual penetration non-consensual or non-voluntary on the part of the victim” and that this consideration defined the accurate scope of the definition of rape under international law.[25] The International Criminal Tribunal for Rwanda in the *Akayesu* case in 1998 held that “rape is a form of aggression” and that “the central elements of the crime of rape cannot be captured in a mechanical description of objects and body parts”. It defined rape as “a physical invasion of a sexual nature, committed on a person under circumstances which are coercive”.[26]

Rape and sexual violence can also be constituent elements of other crimes under international law. The International Criminal Tribunal for the former Yugoslavia in the *Delalić* case held that rape could constitute torture when the specific conditions of torture were fulfilled.[27] The International Criminal Tribunal for Rwanda in the *Akayesu* case and *Musema* case held that rape and sexual violence could constitute genocide when the specific conditions of genocide were fulfilled.[28]

It has been specified in practice that the prohibition of sexual violence is non-discriminatory, i.e., that men and women, as well as adults and children, are equally protected by this prohibition. Except for forced pregnancy, the crimes of sexual violence in the Statute of the International Criminal Court are prohibited when committed against “any person”, not only women. In addition, in the *Elements of Crimes* for the International Criminal Court, the concept of “invasion” used to define rape is “intended to be broad enough to be gender-neutral”.[29]

Declaration on the Elimination of Violence against Women

The United Nations adopted the Declaration on the Elimination of Violence against Women in 1993. This declaration is an advance in women's rights, specifically because it moves the issue of violence against women out of the private, domestic sphere and into the public, state sphere. Recognizing the immense impact of violence on women, this document complements the Convention on the Elimination of All Forms of Discrimination against Women.

The General Assembly,

Recognizing the urgent need for the universal application to women of the rights and principles with regard to equality, security, liberty, integrity and dignity of all human beings,

Noting that those rights and principles are enshrined in international instruments, including the Universal Declaration of Human Rights,¹ the International Covenant on Civil and Political Rights,² the International Covenant on Economic, Social and Cultural Rights,³ the Convention on the Elimination of All Forms of Discrimination against Women,⁴ and the Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment,⁵

Recognizing that effective implementation of the Convention on the Elimination of All Forms of Discrimination against Women would contribute to the elimination of violence against women and that the Declaration on the Elimination of Violence against Women, set forth in the present resolution, will strengthen and complement that process,

Concerned that violence against women is an obstacle to the achievement of equality, development and peace, as recognized in the Nairobi Forward-looking Strategies for the Advancement of Women,⁶ in which a set of measures to combat violence against women was recommended, and to the full implementation of the Convention on the Elimination of All Forms of Discrimination against Women,

Affirming that violence against women constitutes a violation of the rights and fundamental freedoms of women and impairs or nullifies their enjoyment of those rights and freedoms, and concerned about the long-standing failure to protect and promote those rights and freedoms in the case of violence against women,

Recognizing that violence against women is a manifestation of historically unequal power relations between men and women, which have led to domination over and discrimination against women by men and to the prevention of the full advancement of women, and that violence against women is one of the crucial social mechanisms by which women are forced into a subordinate position compared with men,

Concerned that some groups of women, such as women belonging to minority groups, indigenous women, refugee women, migrant women, women living in rural or remote communities, destitute women, women in institutions or in detention, female children, women with disabilities, elderly women and women in situations of armed conflict, are especially vulnerable to violence,

Recalling the conclusion in paragraph 23 of the annex to Economic and Social Council resolution 1990/15 of 24 May 1990 that the recognition that violence against women in the family and society was pervasive and cut across lines of income, class and culture had to be matched by urgent and effective steps to eliminate its incidence,

Recalling also Economic and Social Council resolution 1991/18 of 30 May 1991, in which the Council recommended the development of a framework for an international instrument that would address explicitly the issue of violence against women,

Welcoming the role that women's movements are playing in drawing increasing attention to the nature, severity and magnitude of the problem of violence against women,

Alarmed that opportunities for women to achieve legal, social, political and economic equality in society are limited, inter alia, by continuing and endemic violence,

Convinced that in the light of the above there is a need for a clear and comprehensive definition of violence against women, a clear statement of the rights to be applied to ensure the elimination of violence against women in all its forms, a commitment by States in respect of their responsibilities, and a commitment by the international community at large to the elimination of violence against women,

Solemnly proclaims the following Declaration on the Elimination of Violence against Women and urges that every effort be made so that it becomes generally known and respected:

Article 1

For the purposes of this Declaration, the term "violence against women" means any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or in private life.

Article 2

Violence against women shall be understood to encompass, but not be limited to, the following:

(a) Physical, sexual and psychological violence occurring in the family, including battering, sexual abuse of female children in the household, dowry-related violence, marital rape, female genital mutilation and other traditional practices harmful to women, non-spousal violence and violence related to exploitation;

(b) Physical, sexual and psychological violence occurring within the general community, including rape, sexual abuse, sexual harassment and intimidation at work, in educational institutions and elsewhere, trafficking in women and forced prostitution;

(c) Physical, sexual and psychological violence perpetrated or condoned by the State, wherever it occurs.

Article 3

Women are entitled to the equal enjoyment and protection of all human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field. These rights include, *inter alia*:

- (a) The right to life;⁷
- (b) The right to equality;⁸
- (c) The right to liberty and security of person;⁹
- (d) The right to equal protection under the law;¹⁰
- (e) The right to be free from all forms of discrimination;¹¹
- (f) The right to the highest standard attainable of physical and mental health;¹²
- (g) The right to just and favourable conditions of work;¹³
- (h) The right not to be subjected to torture, or other cruel, inhuman or degrading treatment or punishment.¹⁴

Article 4

States should condemn violence against women and should not invoke any custom, tradition or religious consideration to avoid their obligations with respect to its elimination. States should pursue by all appropriate means and without delay a policy of eliminating violence against women and, to this end, should:

- (a) Consider, where they have not yet done so, ratifying or acceding to the Convention on the Elimination of All Forms of Discrimination against Women or withdrawing reservations to that Convention;
- (b) Refrain from engaging in violence against women;
- (c) Exercise due diligence to prevent, investigate and, in accordance with national legislation, punish acts of violence against women, whether those acts are perpetrated by the State or by private persons;
- (d) Develop penal, civil, labour and administrative sanctions in domestic legislation to punish and redress the wrongs caused to women who are subjected to violence; women who are subjected to violence should be provided with access to the mechanisms of justice and, as provided for by national legislation, to just and effective remedies for the harm that they have suffered; States should also inform women of their rights in seeking redress through such mechanisms;
- (e) Consider the possibility of developing national plans of action to promote the protection of women against any form of violence, or to include provisions for that purpose

in plans already existing, taking into account, as appropriate, such cooperation as can be provided by non-concerned with the issue of violence against women;

(f) Develop, in a comprehensive way, preventive approaches and all those measures of a legal, political, administrative and cultural nature that promote the protection of women against any form of violence, and ensure that the re-victimization of women does not occur because of laws insensitive to gender considerations, enforcement practices or other interventions;

(g) Work to ensure, to the maximum extent feasible in the light of their available resources and, where needed, within the framework of international cooperation, that women subjected to assistance, such as rehabilitation, assistance in child care and maintenance, treatment, counselling, facilities and programmes, as well as support structures, and should take all other appropriate measures to promote their safety and physical and psychological rehabilitation;

(h) Include in government budgets adequate resources for their activities related to the elimination of violence against women;

(i) Take measures to ensure that law enforcement officers and public officials responsible for implementing policies to prevent, investigate and punish violence against women receive training to sensitize them to the needs of women;

(j) Adopt all appropriate measures, especially in the field of education, to modify the social and cultural patterns of conduct of men and women and to eliminate prejudices, customary practices and all other practices based on the idea of the inferiority or superiority of either of the sexes and on stereotyped roles for men and women;

(k) Promote research, collect data and compile statistics, especially concerning domestic violence, relating to the prevalence of different forms of violence against women and encourage research on the causes, nature, seriousness and consequences of violence against women and on the effectiveness of measures implemented to prevent and redress violence against women; those statistics and findings of the research will be made public;

(l) Adopt measures directed towards the elimination of violence against women who are especially vulnerable to violence;

(m) Include, in submitting reports as required under relevant human rights instruments of the United Nations, information pertaining to violence against women and measures taken to implement the present Declaration;

(n) Encourage the development of appropriate guidelines to assist in the implementation of the principles set forth in the present Declaration;

(o) Recognize the important role of the women's movement and non-governmental organizations world wide in raising awareness and alleviating the problem of violence against women;

(p) Facilitate and enhance the work of the women's movement and non-governmental organizations and cooperate with them at local, national and regional levels;

(q) Encourage intergovernmental regional organizations of which they are members to include the elimination of violence against women in their programmes, as appropriate.

Right to be Free from Sexual Violence

The United Nations has addressed the global problem of sexual violence in many of its official documents. Below are excerpts from a number of UN World Conference documents that lay out the right of all people to be free from sexual violence. Significantly, the documents express sexual violence as a gendered phenomenon and recognize sexual violence as a crime against humanity.

Vienna Declaration para. 18—Gender-based violence and all forms of sexual harassment and exploitation, including those resulting from cultural prejudice and international trafficking, are incompatible with the dignity and worth of the human person, and must be eliminated; **para. 38**—[T]he World Conference on Human Rights stresses the importance of working towards the elimination of violence against women in public and private life. . . . The World Conference on Human Rights . . . urges States to combat violence against women. . . . Violations of the human rights of women in situations of armed conflict are violations of the fundamental principles of international human rights and humanitarian law. All violations of this kind, including a particular murder, systematic rape, sexual slavery, and forced pregnancy, require a particularly effective response.

ICPD Principle 4—Advancing gender equality and equity and the empowerment of women, and the elimination of all kinds of violence against women, and ensuring women's ability to control their own fertility, are cornerstones of population and development-related programmes; **para 4.4 (e)**—Eliminating violence against women; **para. 6.20**—Governments, in collaboration with non-governmental organizations and the private sector, should strengthen formal and informal support systems and safety nets for elderly people and eliminate all forms of violence and discrimination against elderly people in all countries, paying special attention to the needs of elderly women. **Para. 10.11**—Governments of receiving countries are further urged to take appropriate steps to avoid all forms of discrimination against migrants. . . . Women and children who migrate as family members should be protected from abuse or denial of their human rights by their sponsors; **para 10.18**—Governments of both receiving countries and countries of origin should adopt effective sanctions against those who organize undocumented migration, exploit undocumented migrants or engage in trafficking in undocumented migrants, especially those who engage in any form of international traffic in women, youth and children.

ICPD+5 para 24 (b)—Governments are urged to prevent trafficking in migrants, in particular women and children subjected to forced labour or sexual or commercial exploitation. . . . **para.48**—Governments should give priority to developing programmes and policies that foster norms and attitudes of zero tolerance for harmful and discriminatory attitudes, including son preference, which can result in harmful and unethical practices such as prenatal sex selection, discrimination and violence against the girls child and all forms of violence against women, including female genital mutilation, rape, incest, trafficking, sexual violence and exploitation. . . . The girl child's access to health, nutrition, education and life opportunities should be protected and promoted. . . .

Beijing para. 165 (c)—Eliminate discriminatory practices by employers and take appropriate measures in consideration of women's reproductive role and functions, such as the denial of employment and dismissal due to pregnancy or breast-feeding, or requiring proof of contraceptive use, and take effective measures to ensure that pregnant women, women on maternity leave or women re-entering the labour market after childbearing are not discriminated against; **para 233 (i)**—Take appropriate measures to ensure that refugee and displaced women, migrant women and women migrant workers are made aware of their human rights and of the recourse mechanisms available to them.

Treaties

CEDAW (1) article 5 (a)—[State Parties shall take all appropriate measures] [t]o modify the social and cultural patterns of conduct of men and women, with a view to achieving the elimination of prejudices and customary and all other practices which are based on the idea of the inferiority or the superiority of either of the sexes or on stereotyped roles of men and women[.] **article 6**—States Parties shall take all appropriate measures, including legislation, to suppress all forms of traffic in women and prostitution of women.

CCPR (2) articles 2 (1), 3—equal right of men and women in the enjoyment of civil and political rights; **article 7**—right to be free from torture or cruel and inhumane treatment or punishment; **26, 27**—Non-discrimination, equality between the sexes, rights of persons belong to minorities.

CRC(3) article 19.1—States Parties shall take all appropriate legislative, administrative, social and educational measures to protect the child from all forms of physical

or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse, while in the care of parent(s), legal guardian(s) or any other person who has the care of the child. **article 34**—States Parties undertake to protect the child from all forms of sexual exploitation and sexual abuse. For these purposes, States Parties shall in particular take all appropriate national, bilateral and multilateral measures to prevent: (a) The inducement or coercion of a child to engage in any unlawful sexual activity; (b) The exploitative use of children in prostitution or other unlawful sexual practices; (c) The exploitative use of children in pornographic performances and materials.

The Rome Statue of the ICC Article 7.1—For the purpose of this Statute, “crime against humanity” means any of the following acts when committed as part of a widespread or systematic attack directed against any civilian population, with knowledge of the attack: . . . (g) Rape, sexual slavery, enforced prostitution, forced pregnancy, enforced sterilization, or any other form of sexual violence of comparable gravity[.]

Beijing Declaration

The United Nations adopted the Beijing Declaration in 1995 at the end of the Fourth World Conference on Women. Although the UN founding charter included the principle of equality between women and men, many women leaders in the United Nations championed putting the principles into practice. The United Nations declared 1976–1985 the Decade of Women. The First World Conference on Women was held in 1975 in Mexico City, followed by the second in 1980 in Copenhagen and the third in 1985 in Nairobi.

1. We, the Governments participating in the Fourth World Conference on Women,
2. Gathered here in Beijing in September 1995, the year of the fiftieth anniversary of the founding of the United Nations,

3. Determined to advance the goals of equality, development and peace for all women everywhere in the interest of all humanity,

4. Acknowledging the voices of all women everywhere and taking note of the diversity of women and their roles and circumstances, honouring the women who paved the way and inspired by the hope present in the world's youth,

5. Recognize that the status of women has advanced in some important respects in the past decade but that progress has been uneven, inequalities between women and men have persisted and major obstacles remain, with serious consequences for the well-being of all people,

6. Also recognize that this situation is exacerbated by the increasing poverty that is affecting the lives of the majority of the world's people, in particular women and children, with origins in both the national and international domains,

7. Dedicate ourselves unreservedly to addressing these constraints and obstacles and thus enhancing further the advancement and empowerment of women all over the world, and agree that this requires urgent action in the spirit of determination, hope, cooperation and solidarity, now and to carry us forward into the next century.

We reaffirm our commitment to:

8. The equal rights and inherent human dignity of women and men and other purposes and principles enshrined in the Charter of the United Nations, to the Universal Declaration of Human Rights and other international human rights instruments, in particular the Convention on the Elimination of All Forms of Discrimination against Women and the Convention on the Rights of the Child, as well as the Declaration on the Elimination of Violence against Women and the Declaration on the Right to Development;

9. Ensure the full implementation of the human rights of women and of the girl child as an inalienable, integral and indivisible part of all human rights and fundamental freedoms;

10. Build on consensus and progress made at previous United Nations conferences and summits—on women in Nairobi in 1985, on children in New York in 1990, on environment and development in Rio de Janeiro in 1992, on human rights in Vienna in 1993, on population and development in Cairo in 1994 and on social development in Copenhagen in 1995 with the objective of achieving equality, development and peace;

11. Achieve the full and effective implementation of the Nairobi Forward-looking Strategies for the Advancement of Women;

12. The empowerment and advancement of women, including the right to freedom of thought, conscience, religion and belief, thus contributing to the moral, ethical, spiritual and intellectual needs of women and men, individually or in community with others and thereby guaranteeing them the possibility of realizing their full potential in society and shaping their lives in accordance with their own aspirations.

We are convinced that:

13. Women's empowerment and their full participation on the basis of equality in all spheres of society, including participation in the decision-making process and access to power, are fundamental for the achievement of equality, development and peace;

14. Women's rights are human rights;

15. Equal rights, opportunities and access to resources, equal sharing of responsibilities for the family by men and women, and a harmonious partnership between them are critical to their well-being and that of their families as well as to the consolidation of democracy;

16. Eradication of poverty based on sustained economic growth, social development, environmental protection and social justice requires the involvement of women in economic and social development, equal opportunities and the full and equal participation of women and men as agents and beneficiaries of people-centred sustainable development;

17. The explicit recognition and reaffirmation of the right of all women to control all aspects of their health, in particular their own fertility, is basic to their empowerment;

18. Local, national, regional and global peace is attainable and is inextricably linked with the advancement of women, who are a fundamental force for leadership, conflict resolution and the promotion of lasting peace at all levels;

19. It is essential to design, implement and monitor, with the full participation of women, effective, efficient and mutually reinforcing gender-sensitive policies and programmes, including development policies and programmes, at all levels that will foster the empowerment and advancement of women;

20. The participation and contribution of all actors of civil society, particularly women's groups and networks and other non-governmental organizations and community-based organizations, with full respect for their autonomy, in cooperation with Governments, are important to the effective implementation and follow-up of the Platform for Action;

21. The implementation of the Platform for Action requires commitment from Governments and the international community. By making national and international commitments for action, including those made at the Conference, Governments and the international community recognize the need to take priority action for the empowerment and advancement of women.

We are determined to:

22. Intensify efforts and actions to achieve the goals of the Nairobi Forward-looking Strategies for the Advancement of Women by the end of this century;

23. Ensure the full enjoyment by women and the girl child of all human rights and fundamental freedoms and take effective action against violations of these rights and freedoms;

24. Take all necessary measures to eliminate all forms of discrimination against women and the girl child and remove all obstacles to gender equality and the advancement and empowerment of women;

25. Encourage men to participate fully in all actions towards equality;

26. Promote women's economic independence, including employment, and eradicate the persistent and increasing burden of poverty on women by addressing the structural causes of poverty through changes in economic structures, ensuring equal access for all women, including those in rural areas, as vital development agents, to productive resources, opportunities and public services;

27. Promote people-centred sustainable development, including sustained economic growth, through the provision of basic education, life-long education, literacy and training, and primary health care for girls and women;

28. Take positive steps to ensure peace for the advancement of women and, recognizing the leading role that women have played in the peace movement, work actively towards general and complete disarmament under strict and effective international control, and support negotiations on the conclusion, without delay, of a universal and multilaterally and effectively verifiable comprehensive nuclear-test-ban treaty which contributes to nuclear disarmament and the prevention of the proliferation of nuclear weapons in all its aspects;

29. Prevent and eliminate all forms of violence against women and girls;

30. Ensure equal access to and equal treatment of women and men in education and health care and enhance women's sexual and reproductive health as well as education;

31. Promote and protect all human rights of women and girls;

32. Intensify efforts to ensure equal enjoyment of all human rights and fundamental freedoms for all women and girls who face multiple barriers to their empowerment and advancement because of such factors as their race, age, language, ethnicity, culture, religion, or disability, or because they are indigenous people;

33. Ensure respect for international law, including humanitarian law, in order to protect women and girls in particular;

34. Develop the fullest potential of girls and women of all ages, ensure their full and equal participation in building a better world for all and enhance their role in the development process.

We are determined to:

35. Ensure women's equal access to economic resources, including land, credit, science and technology, vocational training, information, communication and markets, as a means to further the advancement and empowerment of women and girls, including through the enhancement of their capacities to enjoy the benefits of equal access to these resources, *inter alia*, by means of international cooperation;

36. Ensure the success of the Platform for Action, which will require a strong commitment on the part of Governments, international organizations and institutions at all levels. We are deeply convinced that economic development, social development and environmental protection are interdependent and mutually reinforcing components of sustainable development, which is the framework for our efforts to achieve a higher quality of life for all people. Equitable social development that recognizes empowering the poor, particularly women living in poverty, to utilize environmental resources sustainably is a necessary foundation for sustainable development. We also recognize that broad-based and sustained economic growth in the context of sustainable development is necessary to sustain social development and social justice. The success of the Platform for Action will also require adequate mobilization of resources at the national and international levels as well as new and additional resources to the developing countries from all available funding mechanisms, including multilateral, bilateral and private sources for the advancement of women; financial resources to strengthen the capacity of national, subregional, regional and international institutions; a commitment to equal rights, equal responsibilities and equal opportunities and to the equal participation of women and men in all national, regional

and international bodies and policy-making processes; and the establishment or strengthening of mechanisms at all levels for accountability to the world's women;

37. Ensure also the success of the Platform for Action in countries with economies in transition, which will require continued international cooperation and assistance;

38. We hereby adopt and commit ourselves as Governments to implement the following Platform for Action, ensuring that a gender perspective is reflected in all our policies and programmes. We urge the United Nations system, regional and international financial institutions, other relevant regional and international institutions and all women and men, as well as non-governmental organizations, with full respect for their autonomy, and all sectors of civil society, in cooperation with Governments, to fully commit themselves and contribute to the implementation of this Platform for Action.

Constitution of the Republic of Ghana

Since achieving independence from the United Kingdom in 1957, the Republic of Ghana has had five constitutions. The most recent was approved in 1992 and amended in 1996. The constitution recognizes fundamental human and citizens' rights and guarantees the right for citizens to maintain cultural rights and practices.

17. EQUALITY AND FREEDOM FROM DISCRIMINATION.

(1) All persons shall be equal before the law.

(2) A person shall not be discriminated against on grounds of gender, race, colour, ethnic origin, religion, creed or social or economic status.

(3) For the purposes of this article, "discriminate" means to give different treatment to different persons attributable only or mainly to their respective descriptions by race, place of origin, political opinions, colour, gender, occupation, religion or creed, whereby persons of one description are subjected to disabilities or restrictions to which persons of another description are not made subject or are granted privileges or advantages which are not granted to persons of another description.

...

27. WOMEN'S RIGHTS.

(1) Special care shall be accorded to mothers during a reasonable period before and after child-birth; and during those periods, working mothers shall be accorded paid leave.

(2) Facilities shall be provided for the care of children below school-going age to enable women, who have the traditional care for children, realise their full potential.

(3) Women shall be guaranteed equal rights to training and promotion without any impediments from any person.

Constitution of the Republic of South Africa, 1996

The current South African Constitution is the country's fifth, and it was the first created by a parliament elected in the first nonracial elections in 1994. It was adopted in 1996 and came into effect in February 1997. The negotiations to end apartheid included the necessity of a nondiscriminatory constitution. The Constitution includes a bill of rights that provides for equality before the law and prohibits discrimination, including discrimination based on sexual orientation. The right to life guaranteed in the Constitution has been held to prohibit capital punishment and allow abortion. The bill of rights also includes the right to use one's language of choice.

9. Equality

Everyone is equal before the law and has the right to equal protection and benefit of the law.

Equality includes the full and equal enjoyment of all rights and freedoms. To promote the achievement of equality, legislative and other measures designed to protect or advance persons, or categories of persons, disadvantaged by unfair discrimination may be taken.

The state may not unfairly discriminate directly or indirectly against anyone on one or more grounds, including race, gender, sex, pregnancy, marital status, ethnic or social origin, colour, sexual orientation, age, disability, religion, conscience, belief, culture, language and birth.

No person may unfairly discriminate directly or indirectly against anyone on one or more grounds in terms of

subsection (3). National legislation must be enacted to prevent or prohibit unfair discrimination.

Discrimination on one or more of the grounds listed in subsection (3) is unfair unless it is established that the discrimination is fair.

...

12. Freedom and the security of the person.

...

2. Everyone has the right to bodily and psychological integrity, which includes the right to make decisions concerning reproduction;

to security in and control over their body; and

not to be subjected to medical or scientific experiments without their informed consent.

Statement on International Women's Day

International Women's Day grew out of the early 20th-century labor movement. The first National Women's Day in the United States was in 1909 in support of striking women garment workers in New York City. In 1910, the Socialist International started a Women's Day to support women's rights and woman suffrage. The first International Women's Day was in 1911 in Austria, Denmark, Germany, and Switzerland. In 1913, International Women's Day also became part of the peace movement in protest of World War I. In 1975, the United Nations began marking International Women's Day on March 8, although countries are free to observe the day on any day of the year. The following statement was issued in 2000 by the president of the Security Council, Anwarul Karim Chowdhury (Bangladesh), on behalf of the council.

As the first International Women's Day of the new millennium is observed throughout the world, members of the Security Council recognize that peace is inextricably linked with equality between women and men. They affirm that the equal access and full participation of women in power structures and their full involvement in all efforts for the prevention and resolution of conflicts are essential for the maintenance and promotion of peace and security. In this context, members welcome the review of the Fourth World Conference on Women as an essential element in achieving this goal.

Members of the Council also recognize that while entire communities suffer the consequences of armed conflict, women and girls are particularly affected. The impact of violence against women and violation of the human rights of women in conflict situations is experienced by women of all ages. Women also constitute the majority of the world's refugees and internally displaced persons.

Members of the Council note that although women have begun to play an important role in conflict resolution, peacekeeping and peace-building, they are still under-represented in decision-making in regard to conflict. If women are to play an equal part in security and maintaining peace, they must be empowered politically and economically, and represented adequately at all levels of decision-making, both at the pre-conflict stage and during hostilities, as well as at the point of peacekeeping, peace-building, reconciliation and reconstruction.

Members of the Council also note that during times of armed conflict and the collapse of communities, the role of women is crucial in preserving social order, and as peace educators both in their families and in their societies, thereby playing an important role in fostering a culture of peace in strife-torn communities and societies.

Members of the Council call upon all concerned to refrain from human rights abuses in conflict situations, often in gender-specific ways, respect international humanitarian law and to promote non-violent forms of conflict resolution and a culture of peace.

Members of the Council recall the obligation to prosecute those responsible for grave breaches of international humanitarian law, while welcoming the inclusion as a war crime, in the Rome Statute of the International Criminal Court (ICC), of all forms of sexual violence and noting the role the Court could play to ending impunity for perpetrators of such crimes.

Members of the Council stress that efforts should be strengthened to provide protection, assistance and training to refugee women, other displaced women in need of international protection and internally displaced women in conflict situations.

Members of the Council underscore the importance of promoting an active and visible policy of mainstreaming a gender perspective into all policies and programmes while addressing armed or other conflicts.

Resolution 1325

The UN Security Council adopted Resolution 1325 on Women, Peace, and Security in 2000 to reaffirm the central role of women in the prevention of conflict and successful peacekeeping and peace building. Recognizing the particular impact war has on women and children, the resolution also calls on all parties to ensure safety for women and children who are in situations of armed conflict from gender-based violence. The resolution is significant for its statement of the importance of gender perspectives in preventing and ending war.

The Security Council,

Recalling its resolutions 1261 (1999) of 25 August 1999, 1265 (1999) of 17 September 1999, 1296 (2000) of 19 April 2000 and 1314 (2000) of 11 August 2000 as well as relevant statements of its President, and recalling also the statement of its President to the press on the occasion of the United Nations Day for Women's Rights and International Peace (International Women's Day) of 8 March 2000 (SC/6816),

Recalling also the commitments of the Beijing Declaration and Platform for Action (A/52/231) as well as those contained in the outcome document of the twenty-third Special Session of the United Nations General Assembly entitled "Women 2000: Gender Equality, Development and Peace for the Twenty-First Century" (A/S-23/10/Rev.1), in particular those concerning women and armed conflict,

Bearing in mind the purposes and principles of the Charter of the United Nations and the primary responsibility of the Security Council under the Charter for the maintenance of international peace and security,

Expressing concern that civilians, particularly women and children, account for the vast majority of those adversely affected by armed conflict, including as refugees and internally displaced persons, and increasingly are targeted by combatants and armed elements, and recognizing the consequent impact this has on durable peace and reconciliation,

Reaffirming the important role of women in the prevention and resolution of conflicts and in peace-building, and stressing the importance of their equal participation and full involvement in all efforts for the maintenance and promotion of peace and security, and the need to increase their role in decision-making with regard to conflict prevention and resolution,

Reaffirming also the need to implement fully international humanitarian and human rights law that protects the rights of women and girls during and after conflicts,

Emphasizing the need for all parties to ensure that mine clearance and mine awareness programmes take into account the special needs of women and girls,

Recognizing the urgent need to mainstream a gender perspective into peacekeeping operations, and in this regard noting the Windhoek Declaration and the Namibia Plan of Action on Mainstreaming a Gender Perspective in Multidimensional Peace Support Operations (S/2000/693),

Recognizing also the importance of the recommendation contained in the statement of its President to the press of 8 March 2000 for specialized training for all peacekeeping personnel on the protection, special needs and human rights of women and children in conflict situations,

Recognizing that an understanding of the impact of armed conflict on women and girls, effective institutional arrangements to guarantee their protection and full participation in the peace process can significantly contribute to the maintenance and promotion of international peace and security,

Noting the need to consolidate data on the impact of armed conflict on women and girls,

1. Urges Member States to ensure increased representation of women at all decision-making levels in national, regional and international institutions and mechanisms for the prevention, management, and resolution of conflict;

2. Encourages the Secretary-General to implement his strategic plan of action (A/49/587) calling for an increase in the participation of women at decision-making levels in conflict resolution and peace processes;

3. Urges the Secretary-General to appoint more women as special representatives and envoys to pursue good offices on his behalf, and in this regard calls on Member States to provide candidates to the Secretary-General, for inclusion in a regularly updated centralized roster;

4. Further urges the Secretary-General to seek to expand the role and contribution of women in United Nations field-based operations, and especially among military observers, civilian police, human rights and humanitarian personnel;

5. Expresses its willingness to incorporate a gender perspective into peacekeeping operations, and urges the Secretary-General to ensure that, where appropriate, field operations include a gender component;

6. Requests the Secretary-General to provide to Member States training guidelines and materials on the protection, rights and the particular needs of women, as well as on the importance of involving women in all peacekeeping and peace-building measures, invites Member States to

incorporate these elements as well as HIV/AIDS awareness training into their national training programmes for military and civilian police personnel in preparation for deployment, and further requests the Secretary-General to ensure that civilian personnel of peacekeeping operations receive similar training;

7. Urges Member States to increase their voluntary financial, technical and logistical support for gender-sensitive training efforts, including those undertaken by relevant funds and programmes, inter alia, the United Nations Fund for Women and United Nations Children's Fund, and by the Office of the United Nations High Commissioner for Refugees and other relevant bodies;

8. Calls on all actors involved, when negotiating and implementing peace agreements, to adopt a gender perspective, including, inter alia:

(a) The special needs of women and girls during repatriation and resettlement and for rehabilitation, reintegration and post-conflict reconstruction;

(b) Measures that support local women's peace initiatives and indigenous processes for conflict resolution, and that involve women in all of the implementation mechanisms of the peace agreements;

(c) Measures that ensure the protection of and respect for human rights of women and girls, particularly as they relate to the constitution, the electoral system, the police and the judiciary;

9. Calls upon all parties to armed conflict to respect fully international law applicable to the rights and protection of women and girls, especially as civilians, in particular the obligations applicable to them under the Geneva Conventions of 1949 and the Additional Protocols thereto of 1977, the Refugee Convention of 1951 and the Protocol thereto of 1967, the Convention on the Elimination of All Forms of Discrimination against Women of 1979 and the Optional Protocol thereto of 1999 and the United Nations Convention on the Rights of the Child of 1989 and the two Optional Protocols thereto of 25 May 2000, and to bear in mind the relevant provisions of the Rome Statute of the International Criminal Court;

10. Calls on all parties to armed conflict to take special measures to protect women and girls from gender-based violence, particularly rape and other forms of sexual abuse, and all other forms of violence in situations of armed conflict;

11. Emphasizes the responsibility of all States to put an end to impunity and to prosecute those responsible for genocide, crimes against humanity, and war crimes including

those relating to sexual and other violence against women and girls, and in this regard stresses the need to exclude these crimes, where feasible from amnesty provisions;

12. Calls upon all parties to armed conflict to respect the civilian and humanitarian character of refugee camps and settlements, and to take into account the particular needs of women and girls, including in their design, and recalls its resolutions 1208 (1998) of 19 November 1998 and 1296 (2000) of 19 April 2000;

13. Encourages all those involved in the planning for disarmament, demobilization and reintegration to consider the different needs of female and male ex-combatants and to take into account the needs of their dependants;

14. Reaffirms its readiness, whenever measures are adopted under Article 41 of the Charter of the United Nations, to give consideration to their potential impact on the civilian population, bearing in mind the special needs of women and girls, in order to consider appropriate humanitarian exemptions;

15. Expresses its willingness to ensure that Security Council missions take into account gender considerations and the rights of women, including through consultation with local and international women's groups;

16. Invites the Secretary-General to carry out a study on the impact of armed conflict on women and girls, the role of women in peace-building and the gender dimensions of peace processes and conflict resolution, and further invites him to submit a report to the Security Council on the results of this study and to make this available to all Member States of the United Nations;

17. Requests the Secretary-General, where appropriate, to include in his reporting to the Security Council progress on gender mainstreaming throughout peacekeeping missions and all other aspects relating to women and girls;

18. Decides to remain actively seized of the matter.

The Baptist Faith and Message

The Southern Baptist Convention is the largest Protestant denomination in the United States. During the 1980s and early 1990s, the convention divided over a number of theological and political issues, including women. More progressive members argued for women's equality, whereas more conservative members supported complementarianism in the home—the notion that women and men are equal in

value before God but have different roles in the family based on gender. As more progressive members left the denomination, conservatives changed the convention's statement of faith to reflect its belief in gendered family roles.

XVIII. The Family

God has ordained the family as the foundational institution of human society. It is composed of persons related to one another by marriage, blood, or adoption.

Marriage is the uniting of one man and one woman in covenant commitment for a lifetime. It is God's unique gift to reveal the union between Christ and His church and to provide for the man and the woman in marriage the framework for intimate companionship, the channel of sexual expression according to biblical standards, and the means for procreation of the human race.

The husband and wife are of equal worth before God, since both are created in God's image. The marriage relationship models the way God relates to His people. A husband is to love his wife as Christ loved the church. He has the God-given responsibility to provide for, to protect, and to lead his family. A wife is to submit herself graciously to the servant leadership of her husband even as the church willingly submits to the headship of Christ. She, being in the image of God as is her husband and thus equal to him, has the God-given responsibility to respect her husband and to serve as his helper in managing the household and nurturing the next generation.

Children, from the moment of conception, are a blessing and heritage from the Lord. Parents are to demonstrate to their children God's pattern for marriage. Parents are to teach their children spiritual and moral values and to lead them, through consistent lifestyle example and loving discipline, to make choices based on biblical truth. Children are to honor and obey their parents.

Genesis 1:26–28; 2:15–25; 3:1–20; Exodus 20:12; Deuteronomy 6:4–9; Joshua 24:15; 1 Samuel 1:26–28; Psalms 51:5; 78:1–8; 127; 128; 139:13–16; Proverbs 1:8; 5:15–20; 6:20–22; 12:4; 13:24; 14:1; 17:6; 18:22; 22:6,15; 23:13–14; 24:3; 29:15,17; 31:10–31; Ecclesiastes 4:9–12; 9:9; Malachi 2:14–16; Matthew 5:31–32; 18:2–5; 19:3–9; Mark 10:6–12; Romans 1:18–32; 1 Corinthians 7:1–16; Ephesians 5:21–33; 6:1–4; Colossians 3:18–21; 1 Timothy 5:8,14; 2 Timothy 1:3–5; Titus 2:3–5; Hebrews 13:4; 1 Peter 3:1–7.

Constitution of the Republic of Rwanda

Rwanda's Constitution was adopted in 2003, replacing the 1991 constitution. The document clearly concerns itself with preventing another genocide after the violence of Hutus against the Tutsi in which 500,000 to 1 million people were killed in 1994. The Rwandan Patriotic Front, led by Paul Kagame, took control, and around 2 million mostly Hutu Rwandans became refugees. The Constitution prohibits political organizations based on racial, ethnic, group, tribal, or any other potentially discriminatory identity. Unfortunately, this clause has also allowed for the suppression of dissent. After the genocide, women were 70 percent of the remaining Rwandan population. The Constitution reserves 24 of 80 seats in Parliament for women.

Article 9:

The State of Rwanda commits itself to conform to the following fundamental principles and to promote and enforce the respect thereof:

1. fighting the ideology of genocide and all its manifestations;
2. eradication of ethnic, regional and other divisions and promotion of national unity;
3. equitable sharing of power;
4. building a state governed by the rule of law, a pluralistic democratic government, equality of all Rwandans and between women and men reflected by ensuring that women are granted at least thirty per cent of posts in decision making organs;
5. building a State committed to promoting social welfare and establishing appropriate mechanisms for ensuring social justice;
6. the constant quest for solutions through dialogue and consensus.

...

Article 11:

All Rwandans are born and remain free and equal in rights and duties. Discrimination of whatever kind based on, inter alia, ethnic origin, tribe, clan, colour, sex, region, social origin, religion or faith, opinion, economic status, culture, language, social status, physical or mental disability or any other form of discrimination is prohibited and punishable by Law.

...

Article 37:

Every person has the right to free choice of employment. Persons with the same competence and ability shall have a right to equal pay for equal work without any discrimination.

Sikh Faith Statement

Guru Nanak founded Sikhism in the Punjab district of India in the 16th century. The world's fifth-largest religion, Sikhism emphasizes the importance of doing good actions rather than simply carrying out rituals. The Sikh scripture is the Guru Granth Sahib, a book Sikhs consider to be a living guru. Sikhs believe in gender equality and focus their lives on their relationship with God and the Sikh community. They believe God's message is written in all of creation, as well as in scripture and the teachings of the gurus.

This statement was compiled under the guidance of Sri Singh Sahib Manjit Singh, the Jathedar of Anandapur, who is one of the five spiritual and temporal heads of Sikhism; and Sri Akhal Takhat Sahib, his deputy.

The Sikh scripture, Guru Granth Sahib, declares that the purpose of human beings is to achieve a blissful state and to be in harmony with the earth and all creation. It seems, however, that humans have drifted away from that ideal. For the earth is today saturated with problems. It is agonizing over the fate of its inhabitants and their future! It is in peril as never before. Its lakes and rivers are being choked, killing its marine life. Its forests are being denuded. A smoky haze envelops the cities of the world. Human beings are exploiting human beings.

The Sense of Crisis

There is a sense of crisis in all parts of the world, in various countries and among various peoples. The demands of national economic growth and individual needs and desires are depleting the natural resources of the earth.

There is serious concern that the earth may no longer be a sustainable biosystem. The major crises facing the earth—the social justice crisis and the environmental crisis—together are heading the earth toward a disastrous situation. The social justice crisis is caused by humanity's confrontation with itself and the environmental crisis is caused by humanity's confrontation with nature.

The social justice crisis is that poverty, hunger, disease, exploitation, and injustice are widespread. There are economic wars over resources and markets.

The rights of the poor and the marginal are violated. Women, constituting half the world's population, have their rights abused.

The environmental crisis caused by humanity's exploitation of nature is leading to the depletion of renewable resources, destruction of forests, and overuse of land for agriculture and habitation. Today pollution is contaminating air, land, and water. Smoke from industries, homes, and vehicles is in the air. Industrial waste and consumer trash is affecting streams and rivers, ponds and lakes. Much of the waste is a product of modern technology; it is not biodegradable and not reusable, and its long-term consequences are unknown. The viability of many animal and plant species, and possibly that of the human species itself, is at stake.

A Sikh Solution

This crisis cries out for an immediate and urgent solution. The crisis requires going back to the basic question of the purpose of human beings in this universe and an understanding of ourselves and God's creation.

We are called to the vision of Guru Nanak which is a World Society comprising God-conscious human beings who have realized God. To these spiritual beings the earth and the universe are sacred; all life is unity, and their mission is the spiritualization of all.

...

The solution to problems manifest in our world lies in prayer and in accepting God's hukam. It is difficult to translate certain Sikh concepts accurately. Hukam is one such concept—it may be best described as a combination of God's will, order, and system. With an attitude of humility, and surrender to the Divine Spirit, conscientious human beings can seek to redress the current crises of the environment and of social justice. In the Sikh Way this is done through the guidance of the Guru, who is the Divine Master and messenger of God.

Equality of Women

Women and their rights have been ignored for too long. Any approach to solving problems of social justice and the environment must be sensitive to women's concerns, and must include women as equals.

Often piecemeal solutions to environmental problems focus on limiting population growth and on family planning programs. Most family planning measures end up abusing women's rights and should be rejected on those grounds alone. Meanwhile they spread mistrust of family planning among women.

Guru Nanak and other Sikh Gurus during their lives advocated equality and dignity of women and took steps to implement these principles. Guru Nanak denounced the idea that spirituality was only for men, and not for women. The first Sikh Guru in his preaching and writings made direct statements emphasizing that women were no less than men:

After the death of one's wife, one seeks another,
and through her social bonds are cemented.

Why should we condemn women who give birth to
leaders and rulers?

Everyone is born of a woman and a woman alone.
Nobody is born otherwise.

God alone is an exception to this rule. (473)

Guru Amardas strongly opposed the custom of sati in the sixteenth century and also advocated widow marriages. Sati was the Indian practice whereby a widow burned herself with her husband's corpse at cremation. Guru Amar Das appointed and ordained a large number of women preachers, and at least one female bishop, Mathura Devi, 400 years ago. The Sikh Gurus also raised their voice against the purdah or veil. Guru Amardas did not even allow the Queen of Haripur to come into the religious assembly wearing a veil.

The immediate effect of these reforms was that women gained an equal status with men. Those who lived as groveling slaves of society became fired with a new hope and courage to lift themselves to be equals of the best in humanity. The spirit of the Sikh woman was raised with the belief that she was not a helpless creature but a responsible being endowed with a will of her own, with which she could do much to mold the destiny of society.

Women came forward as the defenders of their honor and dignity. They also became the rocks that stood against tyrants. Without the burden of unnecessary and unreasonable customs, Sikh women became the temporal and spiritual supporters of men, often acting as the "conscience of men." Sikh women proved themselves the equals of men in service, devotion, sacrifice, and bravery.

Constitution of the Islamic Republic of Afghanistan

More than 500 delegates representing the population of Afghanistan agreed on the Constitution of the Islamic Republic of Afghanistan in January 2004 at the Constitutional Loya Jirga. President Hamid Karzai ratified the Constitution on January 26, 2004.

Article Six

The state shall be obligated to create a prosperous and progressive society based on social justice, preservation of human dignity, protection of human rights, realization of democracy, attainment of national unity as well as equality between all peoples and tribes and balance development of all areas of the country.

...

Article Twenty-Two

Any kind of discrimination and distinction between citizens of Afghanistan shall be forbidden. The citizens of Afghanistan, man and woman, have equal rights and duties before the law.

...

Article Forty-Four

The state shall devise and implement effective programs to create and foster balanced education for women, improve education of nomads as well as eliminate illiteracy in the country.

...

Article Fifty-Four

Family is the fundamental pillar of the society, and shall be protected by the state. The state shall adopt necessary measures to attain the physical and spiritual health of the family, especially of the child and mother, upbringing of children, as well as the elimination of related traditions contrary to the principles of the sacred religion of Islam.

...

Article Eighty-Three

Members of the House of People shall be elected by the people through free, general, secret and direct balloting. The work period of the House of People shall terminate,

after the disclosure of the results of the elections, on the 1st of Saratan of the fifth year and the new parliament shall commence work. The elections for members of the House of People shall be held 30–60 days prior to the expiration of the term of the House of People.

The number of the members of the House of People shall be proportionate to the population of each constituency, not exceeding the maximum of two hundred and fifty individuals. Electoral constituencies as well as other related issues shall be determined by the elections law. The elections law shall adopt measures to attain, through the electorate system, general and fair representation for all the people of the country, and proportionate to the population of every province, on average, at least two females shall be the elected members of the House of People from each province.

Article Eighty-Four

Members of the House of Elders shall be elected and appointed as follows:

From amongst each provincial council members, one individual shall be elected by the respective council for a four-year term;

From amongst district councils of each province, one individual, elected by the respective councils, for a three-year term;

The remaining one third of the members shall be appointed by the President, for a five-year term, from amongst experts and experienced personalities, including two members from amongst the impaired and handicapped, as well as two from nomads.

The President shall appoint fifty percent of these individuals from amongst women. The individual selected as a member of the House of Elders shall lose membership to the related Council, and, another individual shall be appointed in accordance with the provisions of the law.

Equal Marriage Rights for All

The United Church of Christ is one of the most progressive Christian denominations in the United States. It was the first denomination to ordain women and support LGBTQ

equality. It was also the first Christian denomination in the United States to call for full marriage equality for LGBTQ people, adopting this statement in 2005.

WHEREAS the Bible affirms and celebrates human expressions of love and partnership, calling us to live out fully that gift of God in responsible, faithful, committed relationships that recognize and respect the image of God in all people; and

WHEREAS the life and example of Jesus of Nazareth provides a model of radically inclusive love and abundant welcome for all; and

WHEREAS we proclaim ourselves to be listening to the voice of a Still Speaking God at that at all times in human history there is always yet more light and truth to break forth from God's holy word; and

WHEREAS many UCC pastors and congregations have held commitment services for gay and lesbian couples for some time, consistent with the call to loving, long-term committed relationships and to nurture family life; and

WHEREAS recognition of marriage carries with it significant access to institutional support, rights and benefits; and

WHEREAS children of families headed by same-gender couples should receive all legal rights and protections; and

WHEREAS legislation to ban recognition of same-gender marriages further undermine the civil liberties of gay and lesbian couples and contributes to a climate of misunderstanding and polarization, increasing hostility against gays and lesbians; and

WHEREAS a Constitutional Amendment has been introduced to this Congress to limit marriage to "only the union of a man and a woman"; and

WHEREAS equal marriage rights for couples regardless of gender is an issue deserving of serious, faithful discussion by people of faith, taking into consideration the long, Council of the United Church of Christ in April, 2004 called the church to action and dialogue on marriage;

THEREFORE LET IT BE RESOLVED, that the Twenty-fifth General Synod of the United Church of Christ affirms equal marriage rights for couples regardless of gender and declares that the government should not interfere with couples regardless of gender who choose to marry and share fully and equally in the rights, responsibilities and commitment of legally recognized marriage; and

LET IT BE FURTHER RESOLVED, that the Twenty-fifth General Synod of the United Church of Christ affirms equal access to the basic rights, institutional protections

and quality of life conferred by the recognition of marriage; and

LET IT BE FURTHER RESOLVED, that the Twenty-fifth General Synod calls for an end to rhetoric that fuels hostility, misunderstanding, fear and hatred expressed toward gay, lesbian, bisexual and transgender persons; and

LET IT BE FURTHER RESOLVED, that the Officers of the United Church of Christ are called upon to communicate this resolution to local, state and national legislators, urging them to support equal marriage rights for couples regardless of gender.

In recognition that these resolutions may not reflect the views or current understanding of all bodies, and acknowledging the pain and struggle their passage will engender within the gathered church, the General Synod encourages the following:

LET IT BE FURTHER RESOLVED, that the Twenty-fifth General Synod calls upon all settings of the United Church of Christ to engage in serious, respectful, and prayerful discussion of the covenantal relationship of marriage and equal marriage rights for couples regardless of gender, using the “God is still speaking, about Marriage” study and discussion guide produced by Wider Church Ministries of the United Church of Christ (available online at ucc.org); and

LET IT BE FURTHER RESOLVED, that the Twenty-fifth General Synod calls upon congregations, after prayerful biblical, theological, and historical study, to consider adopting Wedding Policies that do not discriminate against couples based on gender; and

LET IT BE FINALLY RESOLVED, that the Twenty-fifth General Synod urges the congregations and individuals of the United Church of Christ to prayerfully consider and support local, state and national legislation to grant equal marriage rights to couples regardless of gender, and to work against legislation, including constitutional amendments, which denies civil marriage rights to couples based on gender.

Statement of His Holiness the Dalai Lama on Bhikshuni Ordination in the Tibetan Tradition

In Buddhism, Bhikshunis are fully ordained Buddhist nuns. The first Buddha allowed women to live in their own monasteries, although they faced more regulations and held

lower status than male monks. Early Buddhist texts were fairly egalitarian about women's capacity to gain nirvana, but historically women have not been allowed to have equal spiritual power or opportunities for leadership. By the 13th century, ordination of women in Theravadin Buddhism had ended, though it continued in other sects as a fairly rare practice. Tibetan Buddhism is the sect of Buddhist thought and practice from Tibet and surrounding areas of Central Asia. The leader of Tibetan Buddhism, the Dalai Lama, has authorized the ordination of women as nuns in the tradition.

First International Congress on Buddhist Women's Role in the Sangha: Bhikshuni Vinaya and Ordination Lineages
Hamburg University, Hamburg, Germany
July 18–20, 2007

- The Buddha taught a path to enlightenment and liberation from suffering for all sentient beings and people of all walks of life, to women as well as men, without discrimination as to class, race, nationality or social background.
- For those who wished to fully dedicate themselves to the practice of his teachings, he established a monastic order that included both a Bhikshu Sangha, an order of monks, and a Bhikshuni Sangha, an order of nuns.
- For centuries, the Buddhist monastic order has thrived throughout Asia and has been essential to the development of Buddhism in all its diverse dimension—as a system of philosophy, meditation, ethics, religious ritual, education, culture, and social transformation.
- While the Bhikshu ordination lineage still exists in almost all Buddhist countries today, the Bhikshuni ordination lineage exists only in some countries. For this reason, the four-fold Buddhist community (of Bhikshus, Bhikshunis, Upasakas, and Upasikas) is incomplete in the Tibetan tradition. If we can introduce the Bhikshuni ordination within Tibetan tradition, that would be excellent in order to have the four-fold Buddhist community complete.
- In today's world, women are playing major roles in all aspects of secular life, including government, science, medicine, law, arts, humanities, education, and business. Women are also keenly interested in participating fully in religious life, receiving religious education and training, acting as role-models, and contributing fully to the development of human society. In the

same way, nuns and followers of Tibetan Buddhism around the world are keenly interested in full ordination for nuns within the Tibetan tradition.

- Given that women are fully capable of achieving the ultimate goal of the Buddha's teachings, in harmony with the spirit of the modern age, the means and opportunity to achieve this goal should be completely accessible to them.
- The most effective means and opportunity for achieving this goal is full ordination (Upasampada) as a Bhikshuni and full participation in the life of a community of Bhikshunis, that is, a Bhikshuni Sangha in their practice tradition.
- Full ordination for women will enable women to pursue wholeheartedly their own spiritual development through learning, contemplating, and meditating, and also enhance their capacities to benefit society through research, teaching, counseling, and other activities to help extend the life of the Buddhadharma.

Constitution of the Kingdom of Cambodia, 1993, as Amended in 2008

Cambodia had been torn by decades of civil war, and so following the Paris Peace Accord, the Cambodian Constituent Assembly was elected in 1993 to draft a constitution for the nation, moving the country to a constitutional monarchy. The protections of rights of citizens are an important part of the Constitution, as well as promotion of economic development, protection of state property, and protection of traditional cultural expressions.

Employment:

Khmer citizens of both sexes have the right to choose any employment according to their ability and to the needs of the society. Khmer citizens of both sexes shall receive equal pay for equal work. The work of housewife at home shall have equal value as the remunerated work done

outside the home. Khmer citizens of both sexes shall have the right to enjoy social security and other social benefits as determined by law. Khmer citizens of both sexes shall have the right to create trade unions and to participate as their members. The organization and functioning of the trade unions shall be determined by law. (Art. 36) . . .

The dismissal of women worker for reason of pregnancy shall be prohibited. Woman shall have the right to take maternity leave with full pay and with guarantee of her seniority in employment and of other social benefits. The State and the society shall provide women, especially those underprivileged living in rural areas, with opportunities to benefit from assistance for a profession, for medical cares, for their children schooling and for decent living conditions. (Art. 46)

Equal Before the Law:

Khmer citizens are equal before the law, enjoying the same rights, liberties and duties regardless of race, color, sex, language, beliefs, religions, political tendencies, birth origin, social status, wealth or other situations. The exercise of personal rights and liberties by any individual shall not adversely affect the rights and freedom of others. The exercise of such rights and liberties shall be in accordance with the law. (Art. 31)

Equality:

. . . Men and women have equal rights in all fields, especially with respect to those of marriage and family.

Marriage shall be done according to the conditions set by the law and based on the principles of mutual consent and monogamy. (Art. 45).

Marriage/Family Life:

All forms of discrimination against women shall be abolished. The exploitation of women's labor shall be prohibited. Men and women have equal rights in all fields, especially with respect to those of marriage and family. Marriage shall be done according to the conditions set by the law and based on the principles of mutual consent and monogamy. (Art. 45)

Mother and father shall have the obligation to take care of their children, to bring them up and to educate them in order to become good citizens. . . .(Art. 47)

. . . The State shall establish infirmaries and maternities in rural areas. (Art.72)

The State shall give full consideration for children and mothers, by encouraging the creation of nurseries and by attending to women without support who have many children under their cares. (Art. 73)

Rights of Women:

Human trafficking, exploitation of prostitution and obscenities which affect the dignity of women shall be prohibited. The dismissal of woman worker for reason of pregnancy shall be prohibited.

Woman shall have the right to take maternity leave with full pay and with guarantee of her seniority in employment and of other social benefits. The State and the society shall provide women, especially those underprivileged living in rural areas, with opportunities to benefit from assistance for a profession, for medical cares, for their children schooling and for decent living conditions. (Art. 46)

Constitution of the Republic of Ecuador, 2008

Ecuador has had 20 constitutions over its nearly 200-year history since independence in 1830. The current constitution, approved in 2008, was intended to stabilize the country and encourage its social and political development. The document provides for the right to healthcare, food, education, and social security.

* * * *

Chapter Two

Female and Male Citizens

Article 6.

All female and male Ecuadorians are citizens and shall enjoy the rights set forth in the Constitution. Ecuadorian nationality is a political and legal bond between individuals and the State, without detriment to their belonging to any of the other indigenous nations that coexist in plurinational Ecuador. Ecuadorian nationality is obtained by birth or naturalization and shall not be forfeited because of marriage or its dissolution or by acquiring another nationality.

The processes of labor selection, hiring and promotion shall be based on requirements of competencies, skills, training, merit and abilities. The use of discriminatory criteria and instruments affecting people's privacy, dignity

and bodily safety is forbidden. The State shall encourage vocational preparation and training to enhance access to, and the quality of, employment and self-employment. The State shall ensure observance of the labor rights of Ecuadorian workers overseas, and shall promote conventions and agreements with other countries to assure normal legal rights for such workers.

...

Article 330.

The insertion into and accessibility of work, in conditions of equality, shall be guaranteed to persons with disabilities. The State and employers shall implement social services and provide special assistance to facilitate their activities. Any reduction in pay for any circumstance related to the condition of a worker with a disability is forbidden.

Article 331.

The State shall guarantee to women equal access to employment, vocational and professional training and advancement, equitable pay, and the option to self-employment. All necessary measures shall be taken to eliminate inequality. Any form of discrimination, harassment or violent action, of any nature, whether direct or indirect, affecting women at work is forbidden.

Article 332.

The State shall guarantee respect for the reproductive rights of all workers, including the elimination of labor risks affecting reproductive health, access to employment and job security, without limitations due to pregnancy or number of children, maternity and breast-feeding rights, and the right to paternity leave. The dismissal of a working woman because of pregnancy and maternity, along with discrimination in connection with reproductive roles, is forbidden.

...

Article 11.

The exercise of rights shall be governed by the following principles: 1. Rights can be exercised, promoted and enforced individually or collectively before competent authorities; these authorities shall guarantee their enforcement. 2. All persons are equal and shall enjoy the same

rights, duties and opportunities. No one shall be discriminated against for reasons of ethnic belonging, place of birth, age, sex, gender identity, cultural identity, civil status, language, religion, ideology, political affiliation, legal record, socio-economic condition, migratory status, sexual orientation, health status, HIV carrier, disability, physical difference or any other distinguishing feature, whether personal or collective, temporary or permanent, which might be aimed at or result in the diminishment or annulment of recognition, enjoyment or exercise of rights. All forms of discrimination are punishable by law. The State shall adopt affirmative action measures that promote real equality for the benefit of the rights-bearers who are in a situation of inequality

...

Article 69.

To protect the rights of persons who are members of a family: 1. Responsible motherhood and fatherhood shall be fostered; and the mother and father shall be obliged to take care, raise, educate, feed, and provide for the integral development and protection of the rights of their children, especially when they are separated from them for any reason. 2. Unseizable family assets are recognized in terms of amount and on the basis of the conditions and limitations provided for by law. The right to give in legacy and inherit is recognized. 3. The State shall guarantee the equality of rights in decision making for the administration of the marital partnership and the joint ownership of assets. 4. The State shall protect mothers, fathers and those who are the heads of family, in the exercise of their obligations and shall pay special attention to families who have broken up for whatever reason. 5. The State shall promote the joint responsibility of both mother and father and shall monitor fulfillment of the mutual duties and rights between mothers, fathers, and children. 6. Daughters and sons shall have the same rights, without any consideration given to kinship or adoption background. 7. No declaration of the quality of the kinship shall be required at the time of registering the birth and no identity document shall refer to the type of kinship.

...

Article 43.

The State shall guarantee the rights of pregnant and breast-feeding women to: 1. Not be discriminated for their pregnancy in education, social, and labor sectors. 2. Free

maternal healthcare services. 3. Priority protection and care of their integral health and life during pregnancy, childbirth and postpartum.

Statement by President Obama on International Women's Day

Barack Obama, president of the United States from 2009–2017, was a committed advocate of gender equality. In 2009, he signed the Lilly Ledbetter Fair Pay Act, a piece of legislation named for a woman who discovered she earned less than her male colleagues and eventually lost her case before the U.S. Supreme Court. Obama also signed the Affordable Care Act, which prevented insurance companies from charging higher premiums based on sex and required free coverage of contraception. His values are reflected in this statement on International Women's Day, a day of observance begun in the early 1900s to call for gender equality around the globe.

On International Women's Day we celebrate the many milestones on the road to gender equality, and recommit ourselves to fight for the rights and opportunities of women and girls around the world.

Empowering women isn't just the right thing to do—it's the smart thing to do. When women succeed, nations are more safe, more secure, and more prosperous. Over the last year, we've seen women and girls inspiring communities and entire countries to stand up for freedom and justice, and I'm proud of my Administration's efforts to promote gender equality worldwide.

As a nation, we've launched new efforts to promote women's economic empowerment and political participation, to prevent and respond to gender-based violence, and to strengthen our commitment to helping more women participate in peacebuilding and conflict resolution. We are promoting food security initiatives that recognize the rights and needs of women farmers, and ensuring that women and girls are at the center of global health programs. And we will continue to focus on empowering women and girls at home and abroad.

We've also worked with a wide range of partners—from the United Nations and civil society groups to the private

sector—to advance this important agenda. Because when it comes to creating a world in which our sons and daughters can reach their potential, we each have a role to play. And we can make even more progress together.

Beijing + 15: The Platform for Action and the European Union, Section V, Findings Concerning the Twelve Critical Areas of Concern

At the Fourth World Conference on Women in Beijing in 1995, delegates adopted the Beijing Declaration and Platform for Action for Equality, Development and Peace. This document affirms the fundamental human rights of women and girls. For the 2010 meeting of the Commission on Women, the European Union undertook an assessment of European progress toward the goal of the Beijing Platform, noting in particular 12 critical areas of concern, beginning with poverty. The rest of the areas of concern are included throughout this volume.

1. Women and Poverty

Both income inequality and poverty have risen over the past 20 years. A substantial shift in poverty has taken place; children and young adults are today more likely to be poor than the population as a whole. Women are more vulnerable to income poverty than men. This is especially the case for single mothers (a category which has grown substantially), older women, immigrant and ethnic minority women, long-term unemployed and inactive women.

The gendered division of work in families directly affects women's access to and participation in the labour market. The unequal sharing of work in families, together with persistent gender inequalities and discrimination in the labour market, have severe effects on women's poverty, including entitlements to social protection.

Employment is a key factor for social inclusion and offers the most important means of escaping poverty. Being employed and earning wages are crucial for the economic independence of women and men, but also having equal access to the social security system and to owning and/or controlling assets such as land and housing. Against the

background of rising income inequality and poverty, especially in some categories, and the economic and financial crisis extra efforts are needed to make a decisive impact on the eradication of poverty. . . .

2. Education and Training of Women

Education has long been perceived as an essential vehicle of equality between women and men and the educational level of women has increased substantially in recent decades. Today girls and young women choose higher education, graduate faster than men, remain in school to completion and often outperform boys overall. Today girls and women have overall higher educational attainment than men and have a more diversified range of choices in scientific areas than men. Women dominate on the level of ISCED 5a in five broad fields of study and men in two. Among PhD graduates women are in the majority in five MS and very close to fifty percent in many countries, but at EU27 level men are in majority and in all EU countries there is a pattern in which men (68%) outnumber women (32%) in tertiary education in mathematics, sciences and technical disciplines.

In all EU countries the employment rate for women and men increases as the level of educational attainment improves. Employment rates for women with high education are higher than men's with basic schooling in most countries. Even if the majority of women are very well educated, they are not fully used as a resource in the labour market.

Women have on average achieved a higher level of education than men in the tertiary education system, yet women still remain under-represented at the highest levels in academic and professional life. While at the beginning of their academic careers women account for 42%, merely 15% of the positions in the highest grade are occupied by women.

3. Women and Health

Gender inequalities in health are still a persistent problem in EU MS. In many Member States preventive programs addressing women's health issues have been set up. But new challenges appear as well. There exists at present overwhelming evidence that violence against women is associated with ill-health of various kinds. This needs to be taken into account when women's health issues are mapped and compared to men's. Otherwise this area of women's health will remain a hidden topic, and the consequences

of “diagnostic” and “treatment” efforts will be ineffective or counterproductive from this perspective.

4. Violence against Women

The reporting to the UN Economic Commission for Europe clearly indicates that many of the Member States (MS) aim at a more co-ordinated approach in tackling violence against women and at least half have developed national strategies or plans of action on this issue. Continued development in policy is visible, especially the criminalisation of violence against women and protection of and support to victims. However, one issue of concern is the lack of focus on the evaluation of policy and practice, to ensure that the measures are implemented as intended.

There seems to be growing recognition within the MS of diversity both as regards forms of violence against women and women subjected to violence. At the same time, more work is needed for the MS to be able to address in a systematic way all forms of violence against women mentioned in the Beijing Platform for Action.

As regards the development of integrated measures to prevent and eliminate violence against women, this remains a challenge as well. Difficulties remain in linking the work on victim protection and support with, for example, child protection, family law proceedings, or practice in relation to immigration and asylum-seeking. This often leads to contradictory outcomes and lack of safety-oriented practice. Consequently, there is still work to be done to create an integrated and consistently victim- and safety-oriented approach to violence against women across policy domains.

5. Women and Armed Conflict

Women are affected by armed conflict in a variety of ways. Contemporary conflicts affect civilian population in particular. Women constitute “strategic targets”, sometimes on a massive scale, as in the case of gang rape used as part of war tactics and “ethnic cleansing”. Many women and girls also become combatants’ domestic and sexual slaves.

But women should be actors in all stages of the conflicts, in particular in the processes of peace and reconstruction. Equal rights and increased participation by women and women’s organisations at all levels of responsibility are both essential goals and means of preventing and resolving conflicts and promoting a culture of peace.

The French Presidency made the following observations based on the survey in 2008:

- “Women and armed conflict” is not a specific issue in foreign and development policy. Instead it is addressed at different levels of government.
- There is often little coordination between these different levels of government. MS do not have an overall strategy for incorporation of the issue in their foreign and development policy.
- The incorporation of a gender perspective is effected in the training of the staff concerned, but to a lesser extent in the implementation of actions on the ground or in the reception of refugees and asylum seekers.
- Women are systematically under-represented in decision-making bodies that deal with this issue

6. Women and the Economy

All employed parents have a right to at least three months’ unpaid leave on the birth of a child.

Several Member States (MS) have introduced measures in order to improve the right to, or to increase the take up of, leave by fathers. However, women’s take-up is much greater than men’s in all countries, which means that parental leave does not always advance gender equality. Long parental leave periods, used only by mothers, may reduce female labour-force participation and affect future career paths and earnings adversely.

MS have made commitments to improve the provision of childcare and pre-school facilities. In many countries a high proportion of childcare facilities operate on a part-time basis only and opening hours are not always compatible with employment, especially not with full-time work. As far as elderly care is concerned, there is a weak institutional provision of such care. This has gender implications since the majority of the elderly are women as well as the majority of the informal providers of care to the elderly.

Both work and family are changing. Women have moved into the public world of paid work in most countries, but in general this has not been accompanied by men’s assuming responsibilities for domestic and care work. The time-use studies confirm the unequal sharing of paid and unpaid work. In most countries, average “tied time” is longer for women than for men and this seems to be the case especially in the new MS, which seems to be related to women’s long paid working hours.

Unpaid care work is one of the biggest barriers to gender equality and affects women's ability to participate in the labour market on the same terms as men. Men tend to work longer average hours in paid employment than women EU-wide, with women working shorter hours in paid employment in all countries. This is both a cause and effect of sex stereotypes about men's breadwinner role and women's care-giving role, reinforcing existing divisions of labour.

Progress has been made in recent years in the employment area. Employment rates have risen for women, thereby bringing the EU closer to the Lisbon targets. Unemployment has come down considerably, and the overall employment rate has been growing strongly. However, the economic outlook has changed markedly because of the financial and economic crisis.

Although it can be noted that the European institutions and the MS have increased their efforts to promote equal opportunities for women and men in employment and to encourage fathers to take a greater responsibility in childcare, most of the gender gaps are still there. Women experience systematic barriers in almost every aspect of work—this ranges from whether they have paid work at all, if they work full-time or part-time; the type of work they obtain or are excluded from; the availability of childcare; their wages, benefits and conditions of work; the absence of equitable pension entitlements. Discrimination is more severe in the case of women who are multiply disadvantaged by factors such as race, ethnicity or indigenous or disability status.

Pay differentials remain one of the most persistent forms of inequality between women and men.

This is disappointing in the light of women's educational achievements and the gradual closing of the gender gap in work experience. Various factors contribute to the gap, and it is difficult to distinguish between pay differences resulting from different labour market characteristics and those due to indirect or direct discrimination, including differences in the evaluation of work in male- and female-dominated sectors and occupations.

7. Women in Power and Decision-making

It is important to note that both efforts and considerable progress have been made in most Member States (MS) to increase participation by women in decision-making processes since 2003. The situation varies significantly between countries, between different decision-making bodies, including elected bodies, government bodies and corporate

bodies, and between different levels of decision-making such as the national, regional, local and EU level. Thus, much remains to be done to improve the overall representation of women in decision-making across the Union.

In recent years, the under-representation of minority groups in power and decision-making has been put on the political agenda. Increased diversity of migrants, growing numbers of newcomers being naturalised and the increased proportion of second generation descendants of migrants in many MS signal the changing composition of the population and the need to redress the imbalance, if demographically representative elected bodies are to be promoted. In the field of gender, furthermore, the issue of migrant and ethnic minority women and decision-making needs to be taken into consideration. It is vital here to address two issues; first, to what extent decision-making bodies represent minority groups, and second, to what extent decision-making bodies represent women, including minority women.

8. Institutional Mechanisms for the Advancement of Women

An increasing number of Member States (MS) now have both a Minister responsible for gender-equality issues and gender-equality bodies, units or departments placed on a high level in the government. The responsibility, status and agency of these gender-equality bodies in relation to different policy areas vary greatly between the MS and there is still a need to enhance the status of these bodies in order to bring the policy area of gender equality to the forefront.

Replacing the independent bodies for protection against discrimination on the ground of sex with bodies for protection against multiple discrimination seems to be a trend among the MS. The impact of this transformation is still to be seen. The importance of acknowledging the heterogeneity of women in terms of age, class, disability, ethnicity/race, religion and sexual orientation is crucial to the recognition of all groups of women. At the same time there is a risk of downplaying gender as a structural dimension when several grounds of discrimination are covered by the same Act and in the same independent bodies.

The relationship between laws against discrimination on the ground of sex and other parts of the gender-equality machinery, which often implies a link between understanding gender relations on both an individual and a collective level, could also be at risk with the shift towards a multidiscrimination approach.

Although gender mainstreaming is coordinated as an overall strategy by most MS, there are still some that have drawn up strategies on how gender mainstreaming should be implemented in all policy fields. Gender-mainstreaming budget and finance policy is of decisive importance in promoting gender equality; it is crucial to highlighting how new investments in different policy areas affect men and women respectively and how these measures are scrutinised through processes of gender mainstreaming.

It is important not to take a linear development for granted in the implementation of gender mainstreaming and the overall institutionalisation of gender-equality machineries. Although it is impossible to draw precise conclusions, not all MS have increased their efforts regarding gender machinery during the last five years. In some MS the National Action Plan for Gender Equality has not been updated. Several of the newer MS have now set up fundamental machinery for gender equality, have thus reached a basic level regarding the status of gender-equality bodies and have introduced gender mainstreaming in some policy areas. In the case of those MS that have been working with gender equality and gender mainstreaming for a longer period of time, not many new initiatives have been taken, for example in the development of gender-mainstreaming strategy.

9. Human Rights of Women

In general, human rights of women are reported on (to the UNECE) to a limited extent by the Member States (MS), when compared with reporting on the other critical areas of concern. One reason for this might be that human rights issues are a broad concept that covers all the other subjects described in the country reports.

A challenge highlighted in many country reports is the need to tackle multiple discrimination and the cross-cutting forms of marginalisation and inequalities such as ethnicity and disability. In addition, human rights issues that appear not to be covered in the reports, but which have been under discussion within the EU, include sexual rights, such as same-sex marriage, adoption of children by same-sex couples, and various forms of bodily integrity, such as reproductive self-determination.

10. Women and the Media

The media, advertising and other public spheres reflect the lack of gender equality in society, while at the same

time helping to cement it. Research shows that images and language have become coarser over the past ten years. In many UNECE reports, the need to combat this situation is addressed, and the need to bring about a dialogue with the media and the advertising industry about their role and responsibility in influencing children and young persons in particular. Public service radio and television have an important role to play in not spreading stereotypical images of men and women, or of reproducing and cementing power structures and gender roles in society.

11. Women and the Environment

The Beijing +10 report refers to discussions on the topic and mentions suggestions like gender balancing indicators that could be developed to trace women's presence in decision-making on the environment and that the gender impact of environmental decisions could be addressed by including a gender dimension in environmental-impact assessments. So both gender-balancing and gender-mainstreaming strategies have been discussed in relation to strategic objectives for women and the environment.

To facilitate these strategies it is necessary to develop some common conceptualizations on what should be included in the concept environment. To define what should be included in the concept of environment it is necessary to go outside the classic environmental area of conservation and pollution. It is important to assess gender balance in environmental management and conservation but equally important to do so in fields like natural resource use, chemicals use and production, climate policies and sustainable consumption. Gender mainstreaming should be a policy strategy that is used in all policy fields. If, for example, climate policy is leading to major mitigation and adaptation strategies the gender effects of this should be clear before strategies are formalized and investments made.

12. The Girl Child

A review of text on the girl child in the EU Member States (MS) shows few documents that are exclusively devoted to the problem and the situation of the girl child in the EU. Furthermore, most documents adopted at EU level concern the status and the situation of children in general

In all countries and all age groups girls state that they are "too fat" more often than boys do. The differences increase

with age and the biggest difference is between 15 year old girls and boys. As regards change over time, more data is needed to draw conclusions about changes and about what possible differences in body dissatisfaction actually mean for girls' self-image, health and wellbeing. Furthermore, how possible changes may be linked to changes in health amongst girls and boys (e.g. overweight according to BMI) or in cultural images of girls and boys (e.g. in the media), remains to be investigated.

In the period (2003–2006) performance in mathematics remained unchanged and the performance advantage of young men remained unchanged. Figures that can be used to monitor change in the proportion of girl students in tertiary education in the field of science, mathematics and computing and in the field of teacher training and education science in the whole of the reporting period

Two issues clearly placed on the MS's political agendas and the issues most frequently discussed by the MS reports to the UNECE are FGM and violence against children. The most frequently recurring form of violence against children in the reporting is sexual violence, either as prostitution and/or trafficking or in relation to the internet. Sexual exploitation of children in prostitution and trafficking and through the internet is clearly of major concern within the MS. Most countries that report progress in this area do not explicitly discuss these measures as intended to improve the situation of girl children in particular.

When it comes to the issue of diversity, the overall trend is that some MS look at the position of ethnic minority girls and/or girls living in poverty, while other grounds of discrimination are not mentioned.

Strategy for Equality between Women and Men, 2010–2015

In 2010, the European Commission made a commitment to gender equality, which is a tenet of the European Union's founding principles. These excerpts from the Strategy for Equality between Women and Men outline the issues the commission faces in moving Europe toward its goal.

1. Equal Economic Independence

Economic independence is a prerequisite for enabling both women and men to exercise control over their lives

and to make genuine choices. Earning one's own living is the main way to achieve this and there has been progress in the participation of women on the labour market during the last decade, with the female employment rate rising to 62.5%.(1) In the EU, women accounted for 9.8 million out of 12.5 million additional employment between 2000 and 2009. This increased participation has contributed to economic growth in the EU.

Getting more women on to the labour market helps counterbalance the effects of a shrinking working-age population, thereby reducing the strain on public finances and social protection systems, widening the human capital base and raising competitiveness. Measures to facilitate work-life balance can have a positive impact on fertility. To reach the Europe 2020 objective of a 75% employment rate for women and men, particular attention needs to be given to the labour market participation of older women, single parents, women with a disability, migrant women and women from ethnic minorities. The employment rates of these groups are still relatively low and remaining gender gaps need to be reduced in both quantitative and qualitative terms.(2)

The impact of parenthood on labour market participation is still very different for women and men in the EU today because women continue to shoulder a disproportionate part of the responsibilities involved in running a family. Many women feel that they still have to choose between a career and their children. Current demographic trends also mean that women and men increasingly have to care for dependants other than children over indefinite periods of time. Member States which have put reconciliation policies in place are seeing high numbers of both women and men in work and relatively sustainable birth rates. The EU has made recent progress in improving the overall framework for a better work/ life balance.(3) The Commission will strive for further progress in this area, paying particular attention to the availability of affordable high-quality care.

The proportion of female entrepreneurs, at 33%(4) (30% in start-ups), is some way short of optimum and most women still do not consider entrepreneurship as a relevant career option. The implementation of the revised directive (5) on self-employed women should remove a major barrier to female entrepreneurship.(6) Young women should also benefit from the growing emphasis on entrepreneurship as one of the basic skills that schools should teach all pupils, as foreseen in the Youth on the Move flagship initiative.(7)

The employment rate of migrant women is still low(8) especially during the first three years in the host country.

For this reason, there is a strong need to provide early support to migrant women and monitor the effect of such assistance. Making them more aware of their rights and facilitating their integration and access to education and health care is crucial.

The ways in which women and men experience poverty and social exclusion are still quite different. Women face a higher poverty risk, particularly lone parents and the elderly, when the pay gap becomes a 'pension gap'. Barriers to employment are also reflected in higher inactivity rates and higher long-term unemployment rates. In addition, amongst disadvantaged groups (i.e. migrant workers, disabled, elderly) gender gaps tend to be much wider and cause many problems for women. Active ageing policies and specific measures in the pension sector are needed to ensure that women have adequate means when they retire.(9)

2. Equal Pay for Equal Work and Work of Equal Value

The principle of equal pay for men and women for work of equal value is enshrined in the EU Treaties. Despite that, the gender pay gap (the average difference between men's and women's hourly gross earnings across the economy as a whole) in the EU remains at 17.8%, with Estonia at 30.9%, the Czech Republic at 26.2%, Austria at 25.5%, and Germany at 23.2% against Italy at 4.9%, Slovenia at 8.5%, and Belgium and Romania at 9%.(16) Clearly this is a situation which the spirit of the EU Treaties requires to be changed over time.

The root causes of the gender pay gap extend well beyond the question of equal pay for equal work. There is a gap between women's educational attainment and professional development, thus special attention should be paid to the transition between education and the labour market. The causes of the pay gap also derive from segregation in the labour market as women and men still tend to work in different sectors/jobs. On the one hand, women and men are often over-represented in certain sectors, with "female" jobs (mostly in health care, education and public administration) being in general less valued than typically male professions. On the other hand, within the same sector or company the jobs done by women tend to be of lower value and less well paid.

The pay gap also reflects other inequalities on the labour market mainly affecting women—in particular their disproportionate share in family responsibilities and the difficulties in reconciling work with private life. Many women work part-time or under atypical contracts: although this permits them to remain in the labour market

while managing family responsibilities, it can have a negative impact on their pay, career development, promotion prospects and pensions.(10)

3. Equality in Decision-Making

In most Member States, women continue to be under-represented in decision-making processes and positions, in particular at the highest levels, despite the fact that they make up nearly half the workforce and more than half of new university graduates in the EU.

Despite progress towards a gender balance in political decision-making, much remains to be done: on average, only one in four members of national parliaments and ministers of national governments is a woman.(11)

In economic decision-making, the proportion of women is lower than that of men at all levels of management and decision-making. Women represent only one in ten board members of the largest publicly listed companies in the EU and 3% among the presidents of the board. Research shows that gender diversity pays off and that there is a positive correlation between women in leadership positions and business performance.

Despite the EU goal, set in 2005, of having 25% of leading positions in the public research sector filled by women, the target is still some way off as only 19% of full professors in EU universities are women.(12)

The prevailing gender imbalance in science and research is still a major obstacle to the European objective of increasing competitiveness and maximising innovation potential.

The Commission will apply the same standards it encourages others to set by making the necessary efforts to improve its internal gender balance, especially in decision making positions.

4. Dignity, Integrity, and an End to Gender-based Violence

There are many forms of violence that women experience because they are women. These include domestic violence, sexual harassment, rape, sexual violence during conflict and harmful customary or traditional practices such as female genital mutilation, forced marriages and honour crimes. It is estimated that in Europe, 20% to 25% of women have suffered physical violence at least once during their lives(13) and there are estimates that up to half a million women living in Europe have been subjected to genital mutilation.(14)

Accordingly, the Action Plan to implement the Stockholm Programme⁽¹⁵⁾ puts emphasis on the protection of victims of crime, including female victims of violence and genital mutilation, and announces a comprehensive EU strategy on gender-based violence. In addition, the Women's Charter envisages the putting into place of a comprehensive and effective policy framework to combat gender-based violence as well as measures, including criminal law, within the limits of its powers, to eradicate female genital mutilation once and for all across Europe.

Gender-based inequalities are also present in healthcare and long-term care as well as in health outcomes. Women and men are confronted with gender-specific health risks and diseases which need to be adequately addressed in medical research and health services. There is a need to ensure that social and health services continue to improve their adaptation to the specific needs of women and men respectively.

Gender related issues are also of particular importance in the area of asylum. The 2008 and 2009 Commission proposals amending the current EU asylum instruments address *inter alia* the key areas where gender specific elements need to be reinforced.

5. Gender Equality in External Actions

The EU policy on the promotion of gender equality within the EU is closely linked to the work undertaken by the Union in third countries. Through all relevant policies under its external action, the EU can exercise significant influence in fostering gender equality and women's empowerment worldwide.

Candidate countries must fully embrace the fundamental principle of equality between women and men. Monitoring the transposition, implementation and enforcement of EU legislation in this area remains a priority of the enlargement process, which the EU supports financially.

In the context of the European Neighbourhood Policy (ENP), the EU supports partner countries' efforts to promote gender equality. The ENP Action Plans set out a jointly agreed agenda of reform priorities and contain commitments of partner countries to engage in dialogue on related issues and to carry out policy and legislative reforms.

The EU remains committed to speedier achievement of the Millennium Development Goals, and to helping to attain the standards set by the Convention on the Elimination of all Forms of Discrimination against Women, as

well as the objectives of the Beijing Platform of Action, and the Cairo Programme of Action, as foreseen in the EU Plan of Action on Gender Equality and Women's Empowerment in Development (2010–2015).⁽¹⁶⁾ The EU guidelines on violence against women and girls and combating all forms of discrimination against them provide guidance for conducting political dialogue and for taking action, where appropriate, in individual cases of women's rights violation. The EU will continue to use its development policies to promote gender equality and women's empowerment.⁽¹⁷⁾

The EU will also actively cooperate with international organisations working on gender equality such as the ILO, the OECD, the UN and the African Union to produce synergies and foster women's empowerment, as well as with the new UN Entity for Gender Equality, UN WOMEN, and will support civil society participation, capacity building and advocacy on gender equality and women's empowerment.

The EU is also committed to protecting women in times of conflict and post-conflict, and to ensuring women's full participation in conflict prevention, peace building and reconstruction processes, and actively implements the EU Comprehensive Approach to the United Nations Security Council Resolutions 1325 and 1820 on Women, Peace and Security. Gender considerations will also be further integrated into humanitarian aid.⁽¹⁸⁾

The EU also integrates gender equality into its trade policy as part of a wider framework of sustainable development and encourages the effective application of the ILO's core labour standards and its Decent Work Agenda, including in relation to non-discrimination, in its preferential trade agreements. The issue of gender equality is also addressed in the Sustainability Impact Assessments which are prepared to help guide negotiators in trade discussions.

Joint Statement on Ending Acts of Violence and Related Human Rights Violations Based on Sexual Orientation and Gender Identity

In 2011, at the meeting of the United Nations Human Rights Council, 85 countries issued a joint statement on LGBTQ rights. The United States cochaired the core group of countries responsible for advancing the statement, along with Colombia and Slovenia. This is the first UN statement to call for ending state sanctions against LGBTQ people. More nations signed on to this statement than any previous UN statement on LGBTQ rights.

1. We recall the previous joint statement on human rights, sexual orientation and gender identity, presented at the Human Rights Council in 2006;

2. We express concern at continued evidence in every region of acts of violence and related human rights violations based on sexual orientation and gender identity brought to the Council's attention by Special Procedures since that time, including killings, rape, torture and criminal sanctions;

3. We affirm the General Assembly joint statement of December 18, 2008 on human rights, sexual orientation and gender identity, supported by States from all five regional groups, and encourage States to join the statement;

4. We commend the attention paid to these issues by international human rights mechanisms including relevant Special Procedures and treaty bodies and welcome continued attention to human rights issues related to sexual orientation and gender identity within the context of the Universal Periodic Review. As the United Nations Secretary General reminded us in his address to this Council at its Special Sitting of 25 January 2011, the Universal Declaration guarantees all human beings their basic rights without exception, and when individuals are attacked, abused or imprisoned because of their sexual orientation or gender identity, the international community has an obligation to respond;

5. We welcome the positive developments on these issues in every region in recent years, such as the resolutions on human rights, sexual orientation and gender identity adopted by consensus in each of the past three years by the General Assembly of the Organization of American States, the initiative of the Asia-Pacific Forum on National Human Rights Institutions to integrate these issues within the work of national human rights institutions in the region, the recommendations of the Committee of Ministers of the Council of Europe, the increasing attention being paid to these issues by the African Commission on Human and People's Rights, and the many positive legislative and policy initiatives adopted by States at the national level in diverse regions;

6. We note that the Human Rights Council must also play its part in accordance with its mandate to "promote universal respect for the protection of all human rights and fundamental freedoms for all, without discrimination of any kind, and in a fair and equal manner" (GA 60/251, OP2);

7. We acknowledge that these are sensitive issues for many, including in our own societies. We affirm the importance of respectful dialogue, and trust that there is common ground in our shared recognition that no-one should

face stigmatization, violence or abuse on any ground. In dealing with sensitive issues, the Council must be guided by the principles of universality and non-discrimination;

8. We encourage the Office of the High Commissioner for Human Rights to continue to address human rights violations based on sexual orientation and gender identity and to explore opportunities for outreach and constructive dialogue to enhance understanding and awareness of these issues with a human rights framework;

9. We recognize our broader responsibility to end human rights violations against all those who are marginalized and take this opportunity to renew our commitment to addressing discrimination in all its forms;

10. We call on States to take steps to end acts of violence, criminal sanctions and related human rights violations committed against individuals because of their sexual orientation or gender identity, encourage Special Procedures, treaty bodies and other stakeholders to continue to integrate these issues within their relevant mandates, and urge the Council to address these important human rights.

Gender Equality Bill

The government of Malawi passed the Gender Equality Act in 2013. As the memorandum to the bill states, the bill “seeks to promote gender equality, equal integration, influence, empowerment, dignity and opportunities for men and women in all functions of society; to prohibit and provide redress for sex discrimination, harmful practices and sexual harassment; to provide public awareness on promotion of gender equality.” This section of the bill addresses sex discrimination and sexual harassment.

A BILL entitled

An Act to promote gender equality, equal integration, influence, empowerment, dignity and opportunities, for men and women in all functions of society, to prohibit and provide redress for sex discrimination, harmful practices and sexual harassment, to provide for public awareness on promotion of gender equality, and to provide for connected matters

ENACTED by the Parliament of Malawi as follows . . .

PART II—SEX DISCRIMINATION

4. (1) A person shall not

(a) treat another person less favourably than he or she would treat a person of his or her own sex; or

(b) apply to the other person an exclusion, distinction or restriction which applies or would apply equally to both sexes but—

(i) which is such that the proportion of one sex who can comply with it is considerably smaller than the proportion of the opposite sex who can comply with it;

(ii) which he or she cannot show to be justifiable irrespective of the sex of the person to whom it is applied; and

(iii) which is to the detriment of the other person because he or she cannot comply with it, with the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise of the rights and fundamental freedoms of that person.

(2) A person who contravenes subsection (1) commits an offence and is liable to a fine of one million Kwacha (K 1,000,000) and to a term of imprisonment for five (5) years.

5. (1) A person shall not commit, engage in, subject another person to, or encourage the commission of any harmful practice.

(2) Any person who contravenes this section commits an offence and is liable to a fine of one million Kwacha (K 1,000,000) and to a term of imprisonment for five (5) years.

6. (1) A person commits an act of sexual harassment if he or she engages in any form of unwanted verbal, non-verbal or physical conduct of a sexual nature in circumstances in which a reasonable person, having regard to all the circumstances, would have anticipated that the other person would be offended, humiliated or intimidated.

(2) A person who sexually harasses another in terms of subsection (1) commits an offence and is liable to a fine of one million Kwacha (K 1,000,000) and to a term of imprisonment for five (5) years.

7. (1) The Government shall take active measures to ensure that employers have developed and are implementing appropriate policy and procedures aimed at eliminating sexual harassment in the workplace which shall—

(a) entitle all persons who have been subjected to sexual harassment in the workplace to raise a grievance about its occurrence and be guaranteed that appropriate disciplinary action shall be taken against perpetrators;

(b) entitle a non-employee who has been subjected to sexual harassment to lodge a grievance with the employer of the perpetrator where the conduct giving rise to the complaint has taken place at the work place or in the course of the perpetrator's employment;

(c) entitle all employees, job applicants and other persons who have dealings with the workplace to be treated with dignity; and

(d) Oblige the person in charge of the work place to—

(i) implement the policy and procedures and impose disciplinary action against employees who do not comply;

(ii) deal seriously, expeditiously, sensitively and confidentially with all allegations of sexual harassment;

(iii) protect employees against victimization, retaliation for lodging grievances and from false accusations;

(iv) explain the procedure which shall be followed by persons who are victims of sexual harassment;

(v) communicate the sexual harassment policy and grievance procedures effectively to all employees; and

(vi) designate a person outside of line management whom a person who has been subjected to sexual harassment may approach for confidential advice and counselling.

(2) A person who has been subjected to sexual harassment need not have exhausted internal sexual harassment procedures before prosecution of the offence can be commenced or civil proceedings can be instituted.

Excerpts from the Political Constitution of the United Mexican States, 1917, as Amended on February 26, 2013

The Mexican Constitution of 1917 was a product of the Mexican revolution, with a decided emphasis on liberty and social reforms. In particular, the Constitution offers more independence for women. It guarantees equal pay for equal work, paid maternity, child labor laws, and the right to strike if the requirements of these laws are not met.

Education:

II. The guiding principles for state education shall be scientific progress and the fight against ignorance, servitude, fanaticism and prejudices. Furthermore, guiding principles for state education shall: . . . c) Contributing to a better human coexistence, in order to strengthen the appreciation and respect for cultural diversity, human dignity, the integrity of the family, the conviction of the society general interest, the fraternity and fairness ideals of everyone's rights, avoiding race, religion, group, sex or individual privileges. (Art. 3)

...

Employment:

V. During pregnancy, women shall not perform such work that requires excessive physical effort and could be dangerous regarding pregnancy. Women have the right to enjoy a disability leave due to childbirth, which shall cover six weeks previous to the birth and six weeks thereafter. During such disability leave, women shall receive their full wages and retain their employment and the rights acquired under their labor contract. During the nursing period, they shall have two special rest periods per day, consisting of half hour each one, to feed their babies. . . .

...

VII. Equal wages shall be paid for equal work, regardless of sex or nationality. . . .

Equal Before the Law:

Man and woman are equal under the law . . . (Art. 4)

Marriage/Family Life:

Man and woman are equal under the law. The law shall protect the organization and development of the family.

Every person has the right to decide, in a free, responsible and informed manner, the number of children desired and the timing between each of them. . . . Any family has the right to enjoy a decent and respectable house. The law will set the instruments and supports necessary to achieve such objective. (Art. 4)

Non-Discrimination:

. . . Any form of discrimination, based on ethnic or national origin, gender, age, disabilities, social status, medical conditions, religious, opinions, sexual orientation,

marital status, or any other form, which violates the human dignity or seeks to annul or diminish the rights and freedoms of the people, is prohibited. (Art. 1)

Constitution of the Socialist Republic of Vietnam

Vietnam's current constitution was adopted in 2013, the third constitution since reunification in 1976. Human rights advocates had hoped the Vietnamese would use this opportunity to end one-party rule and institute periodic democratic elections. Ninety-eight percent of the National Assembly, 90 percent of which are members of the Communist Party, voted for the draft supported by the government.

Article 26

1. Male and female citizens have equal rights in all fields. The State has a policy to guarantee equal gender rights and opportunities.
2. The State, the society, and the family create conditions for women's comprehensive developments and promotion of their role in the society.
3. Sex discrimination is strictly prohibited.

World Council of Churches Statement on Status of Women

In 2013, Dr. Isabel Phiri of the World Council of Churches delivered a statement at the United Nations 57th Session of the Commission on the Status of Women. The World Council of Churches is committed to promoting justice and peace. There are 348 member churches from around the world that make up the council, and they represent more than half a billion Christians worldwide.

The World Council of Churches, a global fellowship of churches with a total membership of 580 million, wrote in March 1992 to the Secretary General of the United Nations, "In various international fora, women are urging the United Nations to recognize that violence against women constitutes the violation of the basic human rights

of half the world's population. As Christians we support these initiatives, guided by the firm conviction that all human beings are made in the image of God and deserve protection and care."

In a statement prepared for the Fourth World Conference on Women in Beijing in 1995, the World Council of Churches said:

It has been painful for us to acknowledge that institutions which should stand in solidarity with women, including governments and the churches, have not often responded with resolute action. We encounter, through our contact with women at the periphery of all our societies, the struggle for dignity and livelihood that women engage in every day. We believe that empowerment is not possible as long as women live in contexts of violence, often exacerbated by cultural and religious tradition.

It was also said:

We draw the attention to the liberating power of religions and we affirm the positive and supportive role that the churches and other religious institutions can play in standing in solidarity with those women who have to make ethical choices and decisions regarding their sexual and reproductive rights. But of equal concern to the World Council of Churches is the increasing religious extremism in all faiths and the deleterious consequences this has on women's legal, political and social rights.

These statements were made two decades ago, but they are still valid and highly relevant in relation to the work of the Commission on the Status of Women today. Now, more than ever, it is necessary to reiterate that women's rights are human rights, and that human rights are universal. Traditional values or religious beliefs cannot justify the acceptance of violence against women, nor can they be accepted as limitations on women's rights and freedom.

Women as well as men are created in the image of God and deserve to be respected, protected, and cared for. It is necessary for member states to agree upon and protect strong international frameworks. Civil society, including the faith-based community, has an important role to challenge attitudes and traditions that contribute to undermining women's rights and dignity. We the peoples of the United Nations have a shared responsibility to protect, defend, and expand women's rights and freedom.

Resolution Adopted by the General Assembly: Child, Early, and Forced Marriage

Every day, 39,000 girls become child brides. Child marriages often lead to detrimental health and well-being outcomes, such as intimate partner violence, sexual abuse, complications in pregnancy and childbirth, an end to education, and the prevention of acquiring vocational skills. Most child marriages occur in rural sub-Saharan Africa (nearly half of young women married before their 18th birthday) and South Asia (more than a third married before their 18th birthday). In response, the United Nations adopted this resolution in 2014 calling on member nations to address the issue of child, early, and forced marriage.

The General Assembly,

...

PP7 Recognizing that child, early and forced marriage is a harmful practice that violates abuses, or impairs human rights and is linked to and perpetuates other harmful practices and human rights violations, that these violations have a disproportionately negative impact on women and girls, and underscoring States' human rights obligations and commitments to promote and protect the human rights and fundamental freedoms of women and girls and to prevent and eliminate the practice of child, early and forced marriage,

PP8 Deeply concerned about the continued prevalence of child, early and forced marriage worldwide, including that approximately 15 million girls are married every year before they reach 18 years, and that more than 700 million women and girls alive today were married before their 18th birthday,

PP9 Noting with concern that the continued prevalence of child, early and forced marriage has had a negative impact on the achievement of Millennium Development Goals 1–6, and their overarching aims, including in the areas of gender equality and the empowerment of women and girls, poverty reduction, education, maternal and child mortality, health, including sexual and reproductive health, and recognizing that child, early and forced marriage continues to impair sustainable development, inclusive economic growth and social cohesion,

PP10 Noting with concern that poverty and insecurity are among the root causes of child, early and forced marriage, that child, early and forced marriage remains

common in rural areas and among the poorest communities, and recognizing that the immediate alleviation and eventual eradication of extreme poverty must remain a high priority for the international community,

PP10bis Recognizing also that child, early and forced marriage is itself a barrier to development and helps to perpetuate the cycle of poverty and that the risk of child, early and forced marriage is also exacerbated in conflict and humanitarian crisis situations,

PP11 Recognizing that child, early and forced marriage is inherently linked to deep-rooted gender inequalities, norms and stereotypes, and harmful practices, perceptions and customs that are obstacles to the full enjoyment of human rights and that the persistence of child, early and forced marriage places children, in particular the girl child, at risk of being exposed to and encountering various forms of discrimination and violence throughout her life,

PP12 Recognizing that child, early and forced marriage undermines women's and girls' autonomy and decision-making in all aspects of their lives and continues to be an impediment to improvements in the education, economic and social status of women and girls in all parts of the world, and that the empowerment of and investment in women and girls is critical for economic growth, including the eradication of poverty, as well as the meaningful participation of women and girls in all decisions that affect them,

PP13 Noting with concern that child, early and forced marriage disproportionately affects girls who have received little or no formal education, and is itself a significant obstacle to educational opportunities for girls and young women, in particular girls who are forced to drop out of school owing to marriage and/or childbirth, and recognizing that educational opportunities are directly related to women's and girls' empowerment, employment, and economic opportunities, and their active participation in economic, social and cultural development, governance and decision-making,

PP14 Recognizing that child, early and forced marriage constitutes a serious threat to multiple aspects of the physical and psychological health of women and girls, including but not limited to their sexual and reproductive health, significantly increasing the risk of early, frequent and unintended pregnancy, maternal and newborn mortality and morbidity, obstetric fistula, and sexually transmitted infections, including HIV/AIDS as well as increasing vulnerability to all forms of violence, and

that every girl and woman at risk of or affected by these practices must have equal access to quality services like education, counselling, shelter and other social services, psychological, sexual and reproductive health care services and medical care,

OP1 Urges all States to enact, enforce and uphold laws and policies aimed at preventing and ending child, early and forced marriage and protecting those at risk, and ensure that marriage is entered into only with the informed, free and full consent of the intending spouses,

OP2 Calls on States, with the participation of relevant stakeholders, including girls, religious and community leaders, civil society, women's and human rights groups, men and boys, and youth organizations, to develop and implement holistic, comprehensive and coordinated responses and strategies to eliminate child, early and forced marriage and to support already married girls, adolescents, and women including through strengthening of child protection systems, protection mechanisms such as safe shelters, access to justice and the sharing of best practices across borders,

OP2bis Calls upon States and the international community to create an environment in which the wellbeing of women and girls is ensured, inter alia, by cooperating, supporting and participating in efforts for the eradication of extreme poverty, and reaffirming that investment in women and girls and the protection of their rights are among the most effective ways to end the practice of child, early and forced marriage,

OP2ter Calls upon States to promote and protect women and girls' right to education through an enhanced emphasis on quality education, including catch-up and literacy education for those who did not receive formal education, while recognizing that education is one of the most effective ways to prevent and end child, early and forced marriage and to allow for married women and girls to make more informed choices about their lives,

OP3 Urges governments to promote and protect the human rights of all women and girls, including their right to have control over and decide freely and responsibly on matters related to their sexuality, including sexual and reproductive health, free of coercion, discrimination and violence, and adopt and accelerate the implementation of laws, policies and programmes which protect and enable the enjoyment of all human rights and fundamental freedoms, including their reproductive rights in accordance with the Programme of Action of the International

Conference on Population and Development, the Beijing Platform for Action and their review outcomes,

OP3bis Encourages relevant UN entities and agencies to continue to collaborate with and support member states in developing and implementing strategies and policies at the national, regional and international levels to prevent and eliminate child, early and forced marriage, as well as to support already married girls, adolescents, and women,

OP4 Recalls the inclusion of a target on eliminating all harmful practices, such as child, early and forced marriage in the outcome document of the Open Working Group on Sustainable Development Goals, recognizes child, early and forced marriage as a barrier to development and the full realization of women's and girls' human rights, and recognises the need to give due consideration to its inclusion in the post-2015 development agenda in order to help ensure progress towards the elimination of child, early and forced marriage,

Transforming Our World: The 2030 Agenda for Sustainable Development

In 2015, the UN General Assembly adopted a resolution for sustainable development to strengthen peace and freedom and improve conditions for people and the natural world. In particular, the agenda addresses the pervasive problem of poverty and its impact on people and the planet. The Sustainable Development Goals should build on the UN Millennium Development Goals and complete what that initiative did not achieve. Additionally, the goals seek gender equality and the empowerment of all women and girls.

Sustainable Development Goals

Goal 1. End poverty in all its forms everywhere

Goal 2. End hunger, achieve food security and improved nutrition and promote sustainable agriculture

Goal 3. Ensure healthy lives and promote well-being for all at all ages

Goal 4. Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all

Goal 5. Achieve gender equality and empower all women and girls

Goal 6. Ensure availability and sustainable management of water and sanitation for all

Goal 7. Ensure access to affordable, reliable, sustainable and modern energy for all

Goal 8. Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all

Goal 9. Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation

Goal 10. Reduce inequality within and among countries

Goal 11. Make cities and human settlements inclusive, safe, resilient and sustainable

Goal 12. Ensure sustainable consumption and production patterns

Goal 13. Take urgent action to combat climate change and its impacts*

Goal 14. Conserve and sustainably use the oceans, seas and marine resources for sustainable development

Goal 15. Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss

Goal 16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels

Goal 17. Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

Acknowledging that the United Nations Framework Convention on Climate Change is the primary international, intergovernmental forum for negotiating the global response to climate change.

Modern Slavery Act, 2015

The United Kingdom's Modern Slavery Act, the first of its kind in Europe, seeks to address the global problem of human trafficking. The bill creates two new civil orders to prevent modern slavery, establishes an antislavery commissioner, and provides for the protection of victims of modern slavery. In particular, it requires business to ensure no modern slavery occurs in their business or supply chain, and it encourages courts to compensate victims when perpetrators' assets are seized.

2. Human trafficking

(1) A person commits an offence if the person arranges or facilitates the travel of another person ("V") with a view to V being exploited.

(2) It is irrelevant whether V consents to the travel (whether V is an adult or a child).

(3) A person may in particular arrange or facilitate V's travel by recruiting V, transporting or transferring V, harbouring or receiving V, or transferring or exchanging control over V.

(4) A person arranges or facilitates V's travel with a view to V being exploited only if—

(a) the person intends to exploit V (in any part of the world) during or after the travel, or

(b) the person knows or ought to know that another person is likely to exploit V (in any part of the world) during or after the travel.

(5) "Travel" means—

(a) arriving in, or entering, any country,

(b) departing from any country,

(c) travelling within any country.

(6) A person who is a UK national commits an offence under this section regardless of—

(a) where the arranging or facilitating takes place, or

(b) where the travel takes place.

(7) A person who is not a UK national commits an offence under this section if—

(a) any part of the arranging or facilitating takes place in the United Kingdom, or

(b) the travel consists of arrival in or entry into, departure from, or travel within, the United Kingdom.

3. Meaning of exploitation

(1) For the purposes of section 2 a person is exploited only if one or more of the following subsections apply in relation to the person.

Slavery, servitude and forced or compulsory labour

(2) The person is the victim of behaviour—

(a) which involves the commission of an offence under section 1, or

(b) which would involve the commission of an offence under that section if it took place in England and Wales.

Sexual exploitation

(3) Something is done to or in respect of the person—

(a) which involves the commission of an offence under—

(i) section 1(1)(a) of the Protection of Children Act 1978 (indecent photographs of children), or

(ii) Part 1 of the Sexual Offences Act 2003 (sexual offences), as it has effect in England and Wales, or

(b) which would involve the commission of such an offence if it were done in England and Wales.

Removal of organs etc.

(4) The person is encouraged, required or expected to do anything—

(a) which involves the commission, by him or her or another person, of an offence under section 32 or 33 of the Human Tissue Act 2004 (prohibition of commercial dealings in organs and restrictions on use of live donors) as it has effect in England and Wales, or

(b) which would involve the commission of such an offence, by him or her or another person, if it were done in England and Wales.

Securing services etc by force, threats or deception

(5) The person is subjected to force, threats or deception designed to induce him or her—

(a) to provide services of any kind,

(b) to provide another person with benefits of any kind, or

(c) to enable another person to acquire benefits of any kind.

Securing services etc from children and vulnerable persons

(6) Another person uses or attempts to use the person for a purpose within paragraph (a), (b) or (c) of subsection (5), having chosen him or her for that purpose on the grounds that—

(a) he or she is a child, is mentally or physically ill or disabled, or has a family relationship with a particular person, and

(b) an adult, or a person without the illness, disability, or family relationship, would be likely to refuse to be used for that purpose.

About the Editors and Contributors

Editors

Susan M. Shaw is professor of women, gender, and sexuality studies at Oregon State University. She specializes in feminist studies in Christianity and is the author of *Reflective Faith: A Theological Toolbox for Women* and *God Speaks to Us, Too: Southern Baptist Women on Church, Home, and Society*. She is coauthor of the introductory women and gender studies textbooks *Women's Voices*, *Feminist Visions: Classic and Contemporary Readings* and *Women Worldwide: Transnational Perspectives on Women*. She is also coauthor of *Girls Rock! 50 Years of Women Making Music*. She blogs for *Huffington Post* and teaches courses in feminist theologies, feminist teaching and learning, and feminism and the Bible. She has led study-abroad experiences in the United Kingdom, Guatemala, Spain, and Costa Rica.

Nancy Staton Barbour, MAIS, is an instructor of women, gender, and sexuality studies and is a PhD student in adult and higher education at Oregon State University in Corvallis, Oregon. Her research explores issues of social justice, equity, inclusion, and diversity in colleges and universities, as well as the roles and experiences of faculty leaders of study abroad.

Patti Duncan is associate professor of women, gender, and sexuality studies at Oregon State University, and she is the editor of *Feminist Formations*. She earned her PhD in women's studies at Emory University. Duncan is the author of *Tell This Silence: Asian American Women Writers and the Politics of Speech*, the codirector and producer of the documentary film *Finding Face* (2009), and the coeditor of *Mothering in East Asian Communities: Politics and Practices*. Her work has been published in *Women's Studies Quarterly*, *Frontiers: A Journal of Women's Studies*, *The Journal of the Motherhood Initiative for Research and Community Involvement (JMI)*; and *Atlantis: Critical Studies in Gender, Culture, and Social Justice*, as well as many anthologies.

Kryn Freehling-Burton is a senior instructor in women, gender, and sexuality studies at Oregon State University, where she coordinates the online WGSS program and advises students

for the online major. She is the coeditor of *Performing Motherhood* and the author of *In the Image of God*, a play about women that has had more than 30 performances throughout California. Freehling-Burton coproduces a regular play-reading series about women scientists in collaboration with the Oregon State Library Special Collections. Her first cowritten documentary is about Gerty Cori and the women scientists at Oregon State; it will premiere in her gender and science class this year. Freehling-Burton and her partner have three grown children and one high schooler.

Jane Nichols, MLIS, is an associate professor and the head of the Teaching and Engagement Department at Oregon State University Libraries & Press. She has more than 10 years of experience supporting faculty and student research and information needs, particularly those in the liberal arts and women, gender, and sexuality studies. Her teaching, scholarship, and service have given her a unique perspective on the information needs of women, gender, and sexuality studies scholars. Nichols's scholarship explores the use of technology to enhance student learning, engagement, and academic success. Her work has appeared in *Journal of Library Innovation* and *Reference & User Services Quarterly*, among other publications. She serves on the board of CALYX Press, which publishes *CALYX: A Journal of Art and Literature by Women*. She is co-project director of a grant from the National Endowment for the Humanities Office of Digital Humanities Open Book Program to resurface, through digitization, CALYX's at-risk literature. She previously served on the editorial board of *Collection Management* and was elected chair of the Association of College and Research Libraries Women and Gender Studies Section, where she led a 400-member professional group to advance women and gender studies librarianship.

Contributors

Abritty Abdullah is currently completing her MA in women, gender, and sexuality studies at Oregon State University. Previously, she earned a liberal arts degree focused on creative writing. Originally from Bangladesh, she connects her scholarly and creative work to gender issues in Bangladesh and in South Asia more generally. Her thesis explores cultural representations of *hijra* (transgender/intersex) communities in three Bangladeshi films. In the future, she intends to broaden her research to consider gender within other South Asian countries.

Camille S. Alexander earned a master's degree in literature with concentrations in composition and rhetoric, Caribbean literature and feminism, and gender studies. She is currently pursuing a PhD in English at the University of Kent under the supervision of postcolonial theorist Dr. Abdulrazak Gurnah.

Liudmila Morales Alfonso has a master's degree in social sciences, with a mention in gender and development, from FLACSO (Facultad Latinoamericana de Ciencias Sociales) in Ecuador. She is a current doctoral candidate in social sciences from the University of Salamanca, Spain. She has been a journalist, editor, and academic and is focused on the role of power and discourses, with an emphasis on sexual and reproductive rights, civil society, media, gender, and the state.

Alexander Allison graduated from Indiana University–Purdue University Fort Wayne with a BA in history with honors. During his undergraduate career, Allison studied at the Pontifical

Catholic University of Valparaíso in Chile. After graduation, he was awarded an ETA Fulbright scholarship in Colombia for the 2016–2017 academic year.

Jennifer M. Almquist is chief assistant to the president and assistant board secretary at Oregon State University. Previously, she served as project manager of a National Science Foundation ADVANCE award and as associate director of the Office of Equity and Inclusion at OSU. Almquist earned her PhD in applied anthropology from OSU. Her scholarship and professional experience are grounded in the application of anthropological and feminist theories and methods to addressing persistent questions about experiences of gender, the nature of work, and the structure of organizations.

Fikrejesus Amahazion received his BA in sociology (*summa cum laude*) from Saint Bonaventure University in New York, and his master's degree and PhD in sociology from Emory University in Georgia. At Emory, he also received the graduate certificate in human rights from Emory's Institute of Human Rights. Dr. Amahazion's work focuses on human rights, political economy, and development, and he is currently teaching and conducting research in East Africa.

Whitney K. Archer holds an EdM in college student services administration and an MA in women, gender, and sexuality studies. As an associate director of Diversity and Cultural Engagement and the director of the Women's Center at Oregon State University, Whitney provides leadership for the Women's Center and support for all seven Cultural Resource Centers.

Sherry Asgill gained an MPhil in literatures in English from the University of the West Indies, Cave Hill campus, where she also worked with Professor Violet Eudine Barriteau at the Centre for Gender and Development Studies. She worked on issues of particular relevance to Caribbean women.

Aneesa A. Baboolal is a PhD student in the Department of Sociology and Criminal Justice at the University of Delaware. She has previously worked with Guyanese organizations in the United States; interned with the embassy in Georgetown, Guyana; and conducted research surrounding domestic violence in Guyanese ethnic enclaves in New York.

Brittany Backen is a graduate student from Oregon State University with a bachelor's degree in history and a minor in French. Her area of focus is 20th-century social and cultural history. She currently works at a plastics manufacturer.

Sarina Bakić is a sociologist and faculty member in the Department of Political Science at the University of Sarajevo, Bosnia, and Herzegovina. She lectures on the sociology of culture and art. Her scientific research areas are communication and cultural studies, as well as cultural phenomena such as kitsch, taste, cultural needs, and cultural reception.

Malobika Banerji is an India-qualified lawyer who has been living in Singapore. She is keenly interested in women studies and actively keeps up to date on the latest developments in this field.

Agnel Barron holds a PhD in literature from the University of Florida. Her research specialties are Caribbean and African American literature and postcolonial theory. She has taught

academic writing at the University of the West Indies, Cave Hill Campus, Barbados. Currently, she teaches English at the Christ Church Foundation School in Barbados.

Lauren Nicole Benke is a PhD candidate in literary studies at the University of Denver. She holds a MPhil in Irish writing from Trinity College, Dublin, and specializes in Irish drama, British and Irish modernisms, and performance studies. Her dissertation is titled “Gestural Articulations of Woolf and Joyce: Toward a Performative Critical Methodology.”

Francesca Bettio is professor of economics at the University of Siena, Italy. She is the author or coauthor of more than seventy publications, including books, articles, and research monographs. As an expert on female employment and gender issues, she has a long record of collaborating with the European Commission.

Lacey Bonar is a PhD candidate in the History Department at West Virginia University. She has taught introductory-level women’s and gender studies courses for West Virginia University’s Center for Women’s and Gender Studies since 2014.

De-Valera N. Y. M. Botchway, PhD, is an associate professor of history (Africa and Africa Diaspora) at the University of Cape Coast, Ghana. His interdisciplinary research and teaching span the history of world civilizations, black religious and cultural nationalism, sports in Ghana, African indigenous knowledge systems, and African studies. He was a research fellow at the Centre of African Studies, University of Cambridge, England. He was an AHP fellow in 2103–2014 and has published two books and some articles.

Nabil Boudraa is an associate professor of French and Francophone studies at Oregon State University. He has received several grants and awards, including a Fulbright Scholar and three NEH Summer Institute Grants. In the summer of 2017, Boudraa will codirect an NEH program on women’s voices in the Maghreb since independence in the 1960s. His publications include *Algeria on Screen: The Films of Merzak Allouache*, *Francophone Cultures through Film*, *Hommage à Kateb Yacine*, and *North African Mosaic: A Cultural Re-appraisal of Ethnic and Religious Minorities*. Nabil is also the coeditor of two special issues of *Journal of North African Studies* devoted to cinema, literature, and the arts in the Maghreb.

Thomas J. Brinkerhoff is a Benjamin Franklin Fellow at the University of Pennsylvania and a candidate for a PhD in history. He specializes in social, gender, and cultural history of modern Latin America, specifically Argentina.

Lauren Brown holds a bachelor of arts in religion from Berry College and a master of divinity from the McAfee School of Theology at Mercer University.

Claudia Bruno, journalist and writer, is on the editorial board of *inGenere* Web magazine. She is among the founders of, and collaborates with, the Italian branch of the International Association of Women Philosophers (IAPh-Italia).

Alicia Bublitz is currently executive director of CALYX Press, an independent feminist publishing house, and is an activist, cultural critic, women’s studies scholar, Vagina Warrior, and lifelong Girl Scout.

William Luke Burton is a college student who strives to learn, share, and experience all facets of humanity. He enjoys lively debates, the mountains, and delicious food.

Tracy R. Butts is a professor of English at California State University, Chico. Her areas of research and teaching interests include African American literature, black women writers, and hip-hop.

Eileen R. Campbell-Reed is associate professor of practical theology and coordinator of mentoring, coaching, and internship for Central Seminary (Kansas) at the satellite campus in Nashville, Tennessee. She is also codirector of the Learning Pastoral Imagination Project, a national, ecumenical, and longitudinal study of ministry. She is the author of *Anatomy of a Schism: How Clergywomen's Narratives Reinterpret the Fracturing of the Southern Baptist Convention*.

Haley Cawthon is the Formations Pastor at Redeeming Church in St. Petersburg, Florida. She received her bachelor's degree in history and philosophy & religion from Piedmont College (2013) and her master's of Divinity from Mercer University's McAfee School of Theology (2016). Her research focuses on the lives of women, the Hebrew Bible, pop culture, and social justice issues.

Kristin K. Chase is a dedicated humanitarian and development professional with experience in proposal writing and donor reporting, academic research, gender mainstreaming and monitoring, and evaluation of projects in the MENA region. Chase graduated from Oregon State University with a bachelor's degrees in women, gender, and sexuality studies and international studies. She has worked in Jordan and Iraq with international organizations and is passionate about designing programs that restore dignity for vulnerable people displaced by conflict.

Sanju Gharti Chhetri is an international student from Nepal currently pursuing her master's degree in women, gender, and sexuality studies at Oregon State University. She is passionate about working for social justice and equality. Some of her research interests are postcolonial and transnational feminisms.

Bohkyung Chun earned her BA in women's studies and French and her MA in women's studies at Ewha Woman's University in Seoul, Korea. She is currently a doctoral student in anthropology at Oregon State University, writing a dissertation on digital presumption among youth in South Korea.

Margaret Anne Clarke is a senior lecturer at the School of Languages and Area Studies, University of Portsmouth, United Kingdom. She specializes in Portuguese language, literature, and culture, and her publications include articles about the role of digital and electronic media and women's writing in the Portuguese-speaking nations.

Kellian Clink is a reference librarian with a master's degree in library science from Madison, Wisconsin; a master's degree in journalism from the University of Minnesota; and a specialist degree in educational leadership from Minnesota State University, Mankato. She has researched queer studies, student affairs, library science, and history.

Jessica Cortesi is exhibits coordinator at the History Center, home of the Allen County–Fort Wayne Historical Society. Since 2013, she has served as assistant book review editor for the Business History Conference's *Enterprise & Society*, a Cambridge University Press quarterly journal.

Lisa J. Cunningham has a PhD in Victorian literature focused on intersections of gender, class, race, and disability and disfigurement. She has a women's and gender studies certificate and currently codirects the women and gender studies program at St. John Fisher College in New York. Her teaching and research interests include U.S. and global queer studies, disability studies, and critical race theory.

JosAnn Cutajar teaches in the Gender Studies Department at the University of Malta and is the director of the Cottonera Resource Centre. This enables her to combine community activism with research and teaching. Cutajar is also the author of *Bormla: A Struggling Community* and has edited two sociology textbooks.

Drew R. Dakessian is a graduate student in women, gender, and sexuality studies at Oregon State University. She aspires to find employment as a feminist blogger focusing on women's health issues and to write and publish a book about women and ADHD, drawing from her personal experience with the disability.

Ermira Danaj is a social sciences graduate from the University of Lausanne and is currently a PhD candidate in social and human sciences at the University of Neuchatel, Switzerland. She is a Fulbright visiting scholar on sociology and gender studies at the New School, New York, and is the author of several reports and articles about gender issues in Albania.

Elizabeth M. Davis is a graduate student in the educational administration and higher education doctoral program at Kent State University in Ohio. She works in the field of international education as an education abroad adviser.

Allyson Dean is a PhD candidate in critical and sociocultural studies in education at the University of Oregon. Her research focuses on gender and the school-to-prison pipeline. She has a master's degree in college student services administration, with a minor in women and gender studies from Oregon State University. Additionally, Dean conducts policy work and research for Oregon State University.

Jennifer deCoste, PhD, is the vice president of Strategy at Credo Consulting. She focuses on working with college presidents and executive teams on strategic planning. Dr. deCoste spent decades working in social justice in higher education, including serving as CDO at numerous institutions. She won Dissertation of the Year from the AERA in 2012 and has served as a professor on numerous campuses.

Mayela Delatorre is working toward her master of arts in women, gender, and sexuality studies from Oregon State University. Her research focuses on the recruitment process of young women to ChickTech, an after-school technology enrichment program. She received her bachelor of arts in 2010 and her bachelor of science in 2011 from Oregon State University. She is a program management analyst with the federal government in Washington, D.C.

Kayo Denda is the head of Margery Somers Foster Center and a women's studies librarian at Rutgers University, where she is also an affiliate faculty of the Women's and Gender Studies Department. She has a MLS and an MA, both from Rutgers University.

Kiranjeet Kaur Dhillon is the associate director of debate and forensics and a lecturer of communication at the University of Southern California.

Jillian M. Duquaine-Watson is a faculty member in the School of Interdisciplinary Studies at the UT-Dallas. Her courses focus on social change and development, and they emphasize global comparative perspectives and cultural competence. She is founder and director of COLIBRI, a nonprofit that promotes collaborative community-based development projects.

Ashlei Edgemon is an undergraduate student in public health and health management and policy at Oregon State University. After graduation, she will attend graduate school, either in the area of student affairs or in public health. She works at the OSU Center for Civic Engagement as well as the OSU Women's Center. She is committed to making the world a more just and equitable place and believes in the collective power of people to bring about meaningful change. She plans to use her education as a tool to help further these passions.

Natalie G. El-Eid is a graduate of the State University of New York at Cortland, where she received a master's degree in English. She also holds a bachelor's degree in psychology from Central Connecticut State University. Her work has previously been published in the academic journal *The Explicator*. She will begin an English PhD program in the fall of 2017.

Anne Elias is an information resources assistant with the University of Michigan Special Collections Library in Ann Arbor, Michigan. She will complete a master of arts in information and learning technologies from the University of Colorado in August 2017. Her professional interests include instructional design and digital learning, specifically their use in libraries.

Anuncia Escala teaches Spanish language and culture at Oregon State University. She received a PhD from the University of Oregon in 1993. She is interested in women's rights in Latin America and Spain and leads delegations to Guatemala and Spain. She is originally from Barcelona, her first language is Catalan, and she likes to introduce students to her culture and language.

Amanda L. Espenschied-Reilly is the dean of general education and online learning for Aultman College, located in Canton, Ohio. She has a BS and an MS in biology from Wright State University, an MA in educational leadership from West Virginia University, and a PhD in higher education administration from Kent State University.

Shirlita Africa Espinosa was a Marie Curie research fellow at the Université du Luxembourg, working on the topic of development and migration. She received her PhD from the University of Sydney in Australia as a Ford International Fellow from 2009 to 2011. Her doctoral research on a migrant ethnography in Australia will soon be published by Palgrave Macmillan. She was born and raised in the Philippines.

Katalin Fábíán is professor of government and law at Lafayette College, Easton, Pennsylvania. She wrote *Contemporary Women's Movements in Hungary: Globalization, Democracy, and*

Gender Equality, and she edited *Globalization: Perspectives from Central and Eastern Europe and Domestic Violence in Postcommunist States: Local Activism, National Policies, and Global Forces*.

Nicole M. Farmer is a counseling psychology doctoral student at the University of Kansas. Her research primarily focuses on the Maker Movement and explores optimal states; access for underserved populations, including women; and career engagement. Additionally, she has served as a consultant for the Philippines National Center for Mental Health.

Cheryl Farney is a candidate for a master's degree in women's studies and gender studies from Loyola University in Chicago.

Tami Fawcett is a graduate student at Oregon State University in the women, gender, and sexuality studies master of arts program. She received her undergraduate degree in global studies with a concentration in peace, conflict, and humanitarian action from California State University, Monterey Bay, where she was a World Affairs Council Singleton scholar. Her current research interests include neocolonialism, girls' education in sub-Saharan Africa, neoliberalism and international aid and development, antidevelopment, and antiracism studies. She hopes to earn a PhD and teach at the university level.

Meghan Fitzgerald is a PhD candidate in Health Policy at Oregon State University. Her interests lie in women's health in the Middle East and the intersections of political conflict and gender-based violence.

Kali Furman is a doctoral student in women, gender, and sexuality studies at Oregon State University. Her research interests are in social justice education, feminist pedagogies, and history. She earned her bachelor's degree in history with minors in English and gender studies at Boise State University, and she received her master of arts in women, gender, and sexuality studies and a graduate certificate in college and university teaching at Oregon State University. Furman has experience teaching women, gender, and sexuality studies at the community college and university levels. She has worked professionally in student affairs for five years with experience in student support services, cultural resource center management, and diversity and social justice education.

Sally Gallagher is professor of sociology in the School of Public Policy at Oregon State University. She is the author of *Making Do in Damascus: Navigating a Generation of Change in Family and Work and Evangelical Identity and Gendered Family Life*, as well as numerous articles on gender, religion, and family caregiving.

Lauren Gallow is a historian and writer who received a master's degree in art and architectural history from the University of California, Santa Barbara. She has studied the visual culture of architecture and the exhibition of architectural prototypes. She works as a writer for an architecture firm in Seattle, Washington.

Susan Gilman is a research librarian at Harvard University. She earned her MLIS in 2011 from the University of Washington Information School and her bachelor's degree in history and women's and gender studies in 2009 from the University of Oregon.

Karis Gjoci is an English instructor who received a master's degree in social and philosophical foundations of education with an international and comparative focus from the University of Akron. She teaches world literature and ESL at Kean University. Her research focuses on women's stories of courage in times of national trauma and their silent resilience that joins the efforts for peace. She is particularly interested in how these stories highlight patterns of sacrifices that women make for the sake of family and country. Her is the author of a collection of stories, *The Albanian Women of 1950s*.

Stephanie Glick, MA, is an artist and educator. Her scholarship explores healing, diasporic trauma, epigenetics, and trauma-informed teaching. She calls on the visual and audio arts as well as body movement to help decolonize her own practice of teaching and learning. Glick is passionate about social justice issues that relate to gender and identity.

Jamie Graen is a freelance writer who received a master's degree in interdisciplinary studies from Oregon State University. She is working on research for a book about developing the politically rich implementation of democracy in Oregon to encompass those who have been previously overlooked in history.

Gabrielle L. Gray is a second-year political science doctoral student at Howard University in the concentrations areas of American government and black politics. Her research focuses on examining racism, social and educational disparities, and the politics of protest. She holds an MA in educational policy and leadership from Marquette University.

Amanda S. Green has a PhD from Oregon State University. She is an applied cultural anthropologist who specializes in indigenous food movements of the Arctic, with a focus on Sámi activism in Sweden. She is completing a postdoctoral fellowship in environmental studies at Davidson College, Davidson, North Carolina.

Kathryn Green is a PhD candidate and graduate teaching assistant in the Department of Comparative Humanities at the University of Louisville, Kentucky. Her research focuses on heroism and the characterization of women in Old English poetry.

Graziele Grilo is a graduate student of women's and gender studies at Towson University. She received her BA from UNICAMP (2012) in political science and her teaching degree in social sciences from the same institution (2010). Her thesis research is in the area of gender, politics, and religion in Brazil, her country of origin.

Amela Hadžajlić is a historian and lecturer at the American University in Bosnia and Herzegovina, teaching modern European history (16th through 20th centuries). Her most important work includes research on Bosnian-Herzegovinian women in the 19th century through travel books and chronicles.

Karim Hamdy is an independent scholar and consulting engineer with interests in sustainable development, gender, business, and cross-cultural communication. He taught languages at Oregon State University and was the founding director of the OSU study-abroad programs in Tunisia (2004–2011). His published work includes refereed papers, book chapters, and book-length translations from Arabic and French into English. He serves as project manager in a

federally funded entrepreneurship project in Tunisia and is a consultant with private companies in Tunisia and France as well as with a government agency in Tunisia.

Molly Hand has a PhD from Florida State University. She is a scholar and editor, specializing in early modern literature and gender studies. She is coeditor of a collection of essays, *Animals and Animality in the Literary Field*, and her research appears in *Renaissance and Reformation/Renaissance et Réforme*, *Working Subjects in Early Modern English Drama*, and the *Oxford Handbook of Thomas Middleton*. She is also the editor of a historical anthology, *Women's Writings in Christian Spirituality*.

Jane Harris is professor of religious studies at Hendrix College, in Conway, Arkansas. She received her doctorate in American religious studies from the University of North Carolina, Chapel Hill. Her research interests include the history of Protestant female missionaries in China in the 19th and 20th centuries.

Adele Harth is a CODA (Child of Deaf Adults), and a RID-certified interpreter with 40 years' experience in the field. She has a BA in history from California State University, Chico.

Sebastian Heiduschke, PhD, is an associate professor in the world languages and cultures program in the School of Language, Culture, and Society at Oregon State University. His publications include books and essays on German film and culture.

Candy A. Henry received her PhD in literature and criticism from Indiana University of Pennsylvania. She was a professor of English at Westmoreland County Community College in Pennsylvania and the author of numerous publications in literary encyclopedias and college textbooks. She passed away in 2017.

Jennifer M. Hewerdine is a professor of English at Arizona Western College in Yuma, Arizona, and a doctoral candidate in rhetoric and composition at Southern Illinois University. She has authored articles on collaborative writing projects and writing center tutoring.

Alexandra Hrycak received a master's and a doctorate in sociology from the University of Chicago. She is currently a professor of sociology at Reed College in Portland, Oregon. Her research and publications explore the roles that women play in contemporary public life in Ukraine. She teaches classes on social movements, culture, and the collapse of communism.

Heather Montes Ireland received her PhD at Indiana University in gender studies with a graduate minor in Latino studies. She is a postdoctoral fellow in the Center for Gender and Sexualities Studies and visiting faculty in the women's and gender studies program at Marquette University in Milwaukee, Wisconsin.

Dong Isbister is an assistant professor of women's and gender studies at the University of Wisconsin, Platteville. Her research and teaching interests include collective memory and immigration, transnational feminism, environmental humanities, U.S. multiethnic studies, women's literature, feminist pedagogy, and translation and interpreting studies. She has published scholarship in books and journals.

Melissa Jacobs is a current graduate student at Clemson University and an alumnus of College of Charleston. She takes pride in both her work as a teacher and her work as an activist. She hopes to earn a PhD so she can continue her path to professorship.

Lzz Johnk is a queer Mad scholar from mid-Michigan. They lived in Cambodia for four years, during which time they became interested in transnational feminist perspectives and queer identities in non-Western contexts. They received their MA in women's and gender studies from Eastern Michigan University in 2016. Lzz is currently researching the lived experiences of multiple marginalized people under American neoliberal capitalism, especially of those who identify as Mad, crip, or disabled.

Natalie P. Johnson is assistant professor of political science and geography at Francis Marion University in Florence, South Carolina. She received her PhD from the University at Albany, SUNY. She teaches constitutional law, criminal justice, and American politics.

Mary Jordan is an immigration attorney in Boulder, Colorado. She represents families and businesses in their immigration applications for a local private practice. Previously, as part of a nonprofit organization, she developed and managed the JUSTICE program, which provided direct legal services to immigrant survivors of domestic violence, trafficking, and other violent crimes.

ReGina E. Kaylor studied women, gender, and sexuality studies at Oregon State University. Her main interests in this area are indigenous women's rights, reproductive justice, and elimination of rape culture in our society.

Brenda Kellar is a PhD candidate in the history of science program at Oregon State University (OSU). Kellar also has an MA in archaeology and is an instructor for the Anthropology Department at OSU. Her research focuses on honey bees and examines the role of science in policy creation.

Njoki-Wa-Kinyatti is a professor and chief librarian at York College, the City University of New York. She holds master's degrees in library and information science and in public administration. Kinyatti's research interests focus on gender discrimination in education and violence in Africa, with a special emphasis on sub-Saharan Africa.

Suphan Kirmizialtin is a historian of the Middle East who received a master's degree and doctorate in history from the University of Texas, in Austin. Her research interests focus on gender, education, and modernization in the late Ottoman Empire and in modern Turkey. She is currently a lecturer at Murad Hudavendigar University in Istanbul and teaches the history of the Turkish Republic.

Reshma Korothe is a Fulbright scholar from India who is pursuing a master's degree in women, gender, and sexuality studies at Oregon State University. Her research examines the interconnection between the undemocratic ideals on nationalism that led to the enactment of the Armed Forces Special Powers Act (AFSPA).

Tuperna Kristensen is working toward her bachelor's of social sciences at the University of Greenland and works as a freelance research assistant at the Survey of Living Conditions in the Arctic, SLiCA Greenland.

Amanda Backer Lappin is a doctoral student in counseling psychology at the University of Kansas. Amanda's research interests include LGBTQ identity development, mental health

first aid, and the role of gender and sexuality in counseling. Amanda is currently working to develop a manual to educate therapists on LGBTQ issues in counseling.

DongMei Li is a PhD candidate in the educational policy and planning program of the Department of Educational Administration, College of Education, at the University of Texas at Austin. Contextualized in the United States and China/Asia, her research examines education policy impacts and implementation with a focus on education access and equity issues, gender inequity, school accountability, and educational reform.

Janet Lockhart, MS, MAIS, has taught women studies classes for Oregon State University, and she has coauthored with Dr. Susan M. Shaw three collections of diversity exercises: *Writing for Change: Raising Awareness of Difference, Power, and Discrimination*, *The Power of Words*, and *Making Connections: Your Education, the World Community, and You*.

Lori A. Loesch received a bachelor of arts from Weber State University in 2008 and a bachelor of arts from the University of Utah in family, consumer, and human development in 2012. Upon completion, she was accepted to Utah State University's graduate school in family, consumer, and human development, specializing in infancy and young children and women and leadership. She completed her master's in human development and was accepted in the PhD program in 2017.

Rosa Lynge Lorentzen is a graduate student in social sciences at Ilisimatusarfik, the University of Greenland. She is also a research assistant at the Survey of Living Conditions in the Arctic, SLiCA Greenland.

Cari Maes is an instructor of history and women, gender, and sexuality studies at Oregon State University. She received an MA in Latin American and Iberian studies from UC, Santa Barbara, and a PhD in history from Emory University. She received a Fulbright grant for research on maternal and infant health in 20th-century Brazil.

Kenneth Maes received a PhD in anthropology from Emory University and is currently assistant professor of anthropology at Oregon State University. He has conducted ethnographic work in Ethiopia since 2006, focusing on community health workers, health systems, and gender and power. He is the author of *The Lives of Community Health Workers: Local Labor and Global Health in Urban Ethiopia*.

Karabo Mafolo has an undergraduate degree in gender studies and sociology from the University of Cape Town. She also completed her honors degree in gender studies at the University of Cape Town. She is interested in how media, sex, and sexuality intersect. Her writing and research is informed by black feminist theory. She is currently pursuing a law degree.

Roxana-Elisabeta Marinescu is an associate professor with the Bucharest University of Economic Studies, in Romania. She holds a PhD magna cum laude from the University of Bucharest, with a thesis on identity and postcolonialism. Dr. Marinescu has published articles, textbooks, and theoretical books on intercultural communication, cultural studies, multilingualism, education for democratic citizenship, and gender studies.

Karen G. Massey is the associate dean for the master's degree programs at the McAfee School of Theology in Atlanta, Georgia. She holds the Watkins Christian Foundation Chair of

Christian Ministry and teaches in the disciplines of Christian education, liturgy and worship, and faith formation. Dr. Massey has published a book, *And Your Daughters Shall Prophesy: Sermons by Women in Baptist Life*, and has written numerous articles, book chapters, and curriculum pieces about worship and faith formation in the church.

Rekopantswe Mate is a lecturer in the Sociology Department at the University of Zimbabwe where she teaches undergraduate social anthropology, gender studies, and qualitative research methods. After her undergraduate studies at the University of Zimbabwe, she did postgraduate studies in the Netherlands at Wageningen University and at the International Institution of Social Studies (ISS), now part of Erasmus University Rotterdam (EUR), for master's and doctoral degrees, respectively. Her research interests are in socioeconomic development and how it encroaches on gender and generational relations in Zimbabwe with publications in journals and book chapters.

Christian Matheis is a visiting assistant professor of government and international affairs in the School of Public and International Affairs at Virginia Tech. He specializes ethics, political philosophy, and philosophy of liberation with concentrations in migration, refugees, feminism, race, global justice, and public policy. His recent research focuses on philosophical conceptions of solidarity in liberatory movements, notions of recognition and identity in liberal models of social justice, moral criteria for regulating how state administrative agencies treat refugees, critiques of immigration and border policies, critiques of whiteness studies, and the aesthetics of race.

Natalie Miller graduated with an honors degree from the chemical engineering program at Oregon State University in June 2017. She has an interest in women studies, especially women in science. She plans to continue her education with a master's degree related to health and safety.

Sahar Mohtashamipour is a social activist and a freelance writer and translator. She holds an associate's degree in architecture. Her bachelor's degree is in social science from Tehran, Iran. Mohtashamipour pursued her education in women's studies at Oregon State University. She wrote a master's thesis on Iraqi women's narratives of the 2003 U.S. invasion of Iraq.

Elba Moises is a community educator who received a master's degree in public health and a graduate certificate in college and university teaching from Oregon State University. Moises is currently a doctoral student in education at the University of Washington. Her research interests are in how learning environments, race, and culture interact with student identity and motivation. Specifically, her research examines the intersections of racialized and teacher identity for graduate teaching assistants of color at predominantly white institutions.

Hasnaa Mokhtar is a PhD student in international development at Clark University, Worcester, Massachusetts. Her current research examines religio-cultural gender-based violence in the Arab Gulf States through an intersectional approach to hegemonic masculinity. She is studying the intersection of Muslim men's social identities with local and global systems of oppression that contribute to the construction of violent and hierarchal forms of Muslim and Islamic masculinities. She holds a master's degree in international development and social change and a bachelor's in English language. Prior to beginning her graduate studies, Mokhtar worked as a journalist for Arab News, Saudi Arabia.

Susan E. Montgomery is associate professor and public services librarian at the Olin Library at Rollins College in Winter Park, Florida. She holds an MA in Latin American studies and an MS in library and information studies. She serves as the library liaison to the Latin American Studies Program.

Meghna Mukherjee is a graduate of Columbia University, where she studied sociology and human rights. She works in nonprofit development and strategy. Her research focuses on issues of gender and its intersection with race, class, and ethnicity, and her projects have covered aspects of women's lives in India, Saudi Arabia, Bahrain, and the United States.

Shpresë Mulliqi, MA, is a PhD candidate and professor of investigative journalism and journalists' rights at the University of Prishtina "Hasan Prishtina" in Prishtinë, Kosovo. She is author of the *Development of the Concept of Media Convergence through Digitalization in Kosovo*.

Brenda Murphy, PhD, lectures in gender studies at the University of Malta. Recent publications include "Malta: A Critical Mapping of Women in the Media" (2017) and *Brewing Identities: Globalisation, Guinness and the Production of Irishness* (2015). She has coauthored *Gender and Sexuality: Mapping Histories and Departures* and *Media Stories: Histories, Methods and Practices* (2016).

JoAnna R. Murphy is a fat studies and cultural studies scholar who received her MA in sociology at the University of Toledo. She is a doctoral candidate at Bowling Green State University in Ohio. Her dissertation research examines women who self-identify as having a body shape, size, or weight outside the cultural norm and their relationship to popular culture, including how and when they accept, resist, and subvert fat-shaming messages.

Aisha K. Nasser was born in Egypt and has lived in Oman, United Arab Emirates, and the United States. Her bachelor's degree in Middle East studies is from American University in Cairo. Her master's degree in women, gender, and sexuality studies is from Oregon State University. Her PhD in Middle East politics is from University of Exeter. Nasser's research has been on power in Naguib Mahfouz's *The Cairo Trilogy*.

Marceline Naudi, PhD, is an academic and activist who lectures in gender studies at the University of Malta and is active in women's and LGBTI groups. She also sits on boards of local and European organizations, mainly in the field of violence against women. She is currently an elected member of GREVIO, the monitoring board of the Istanbul Convention.

Florine Ndakuya is a PhD candidate at the University of Wisconsin, Milwaukee, where she also received her bachelor's degree. Her dissertation focus is understanding HIV risk factors and prevention needs among young women in Kenya. Ndakuya was born and raised in Kenya and currently resides in the United States, where she is a registered nurse.

Patricia Neville, PhD, is a sociologist and lecturer in social sciences at the School of Oral and Dental Sciences, at the University of Bristol. Her research on the sociology of gender and health has been published in such journals as *Health Sociology Review*, *New Media & Society*, *Teaching Sociology*, *Journal of Gender Studies*, and *Journal of Men's Studies*.

Yuanlu Niu is a doctoral student in the Department of Workforce Education and Development at Southern Illinois University, Carbondale (SIUC). She holds a master of business administration degree from SIUC. Her research focuses on workforce diversity, physical appearance discrimination, human resource development, gender issues in Asia, and women's studies.

Melissa Norton graduated from Indiana University–Purdue University Fort Wayne in 2016 with bachelor's degrees in history and women's studies. She has presented papers at Indiana University–Purdue University Fort Wayne Undergraduate History Conference and Indiana University Women's and Gender Studies Undergraduate Conference.

Leakhena Nou is a Cambodian-born medical sociologist. She is an associate professor of sociology at California State University, Long Beach, and is the founder and director of the Applied Social Research Institute of Cambodia (ASRIC). Her scholarly work encompasses the areas of genocide studies, women's studies, Cambodian mental and physical health, human rights, and restorative justice.

Alexandra Novitskaya is a PhD student in women's, gender, and sexuality studies at Stony Brook University, SUNY. Her research interests are in the intersections of sexuality, national identity, migration studies, and queer theory. In her doctoral dissertation, she explores the experiences of nonheterosexual Russian emigres in the United States.

Vaida Obelene, PhD, is a researcher at the Uppsala Centre for Russian and Eurasian Studies, where she works on post-Soviet sexualities. She subsequently worked as research officer on gender mainstreaming at the European Institute for Gender Equality.

Maralisa Morales Ortiz was born and raised in Bogotá, Colombia. In 2012, she earned her master's degree in Latino studies from Oregon State University, where she currently teaches Spanish. Her research interests are agency around Latino sexualities and how ideas about sexuality are constructed. In addition to her work at OSU, she teaches human sexuality to Latino teens.

Aneta Ostaszewska, PhD, is an assistant professor at the Institute of Social Prevention and Resocialization at the University of Warsaw, Poland. She is an author and coauthor of works on auto/biography and women's issues.

Idir Ouahes studied at London's School of Oriental and African Studies and then completed a PhD at the University of Exeter. His thesis looked at French attempts at creating a colonial protectorate in the Levant and local efforts limiting that vision. Ouahes teaches international politics at Marbella International University Centre in Spain. He briefly worked for the House of Commons and the U.K. government. He has published academic chapters and articles in English and French.

Cat Pausé is the editor of *Queering Fat Embodiment*. As a senior lecturer in human development and fat studies researcher at Massey University in New Zealand, her research focuses on the effects of spoiled identities on the health and well-being of fat individuals. Her work appears in scholarly journals such as *Feminist Review* and *Narrative Inquiries in Bioethics* as well as online for the *Huffington Post* and *The Conversation*, among others.

Michael Pelz received his PhD from the University of Toronto. His research focuses on LGBT rights in the EU, particularly in the Baltic area.

Katharina B. Pelzelmayer analyzes gendered and ethnicized understandings of work in 24-hour elderly care in Switzerland for her doctoral thesis. She is interested in gender theories, feminist epistemology, bodies, and women's health.

Beth L. Perlman is a doctoral psychology intern at the University of Washington Counseling Center. She received her master's degree in community counseling from the University of Nebraska, Lincoln, and is currently a doctoral candidate in counseling psychology at the University of Georgia. Perlman's dissertation explores the influence of immigration-related media depictions and public policy on psychological well-being.

Jamie L. Petts is a biocultural medical anthropologist who received a master's degree in international public health from Oregon State University in 2009, and she is currently a doctoral candidate in applied medical anthropology at Oregon State University. She is doing dissertation research studying well-being among adopted and migrant Ethiopian youth in the United States; this work is being funded by the National Science Foundation.

MarieKathrine Poppel holds a master's in social sciences from University of Greenland, where she teaches and researches gender and gender equality issues. She has published extensively, most recently including "Are Women Taking over Power and Labour from Men? Gender Relations in Pre- and Post-Colonial Greenland" (2015) and "Citizenship Practices" (2014). She edited the book *Gender and Violence in Greenland*.

Farhana Rahman is a Cambridge International Trust Scholar and PhD candidate at the Centre for Gender Studies, University of Cambridge. Her research interests include gender, religion, and lived experiences in Muslim societies. Farhana has extensive experience in the gender and development sector, working internationally for various organizations in the Global South in countries such as Afghanistan, Bangladesh, Uganda, and Zambia.

Joanna K. Raskauskas was born and raised in Livermore, California. She received a bachelor's degree in women, genders, and sexuality studies from Oregon State University. Raskauskas will continue her education in the counseling field. She is the second author in her family; her sister Juliana L. Raskauskas (1975–2016) worked hard to end social injustice of bullying. Joanna works hard and participates in activism that will promote gender equality and fight sizeism.

Herwig Reiter, PhD, is a senior researcher at the German Youth Institute in Munich, Germany. His work about Eastern Europe and Lithuania has been published in the *Journal of International Relations and Development* and the *Journal of Baltic Studies*.

Laura Rice is professor emerita of comparative literature at Oregon State University. Her publications include books and articles on North African literature, gender, literacy, and women's roles in development. As principal investigator, she has designed and conducted federally funded R&D projects on the MENA region sponsored by the National Endowment for the Humanities, Fulbright, U.S. Department of Education, and the U.S. Department of State.

Andrea Robertsdotter is currently an assistant professor and campus librarian in the Department of Public Library Services at Western Kentucky University, Glasgow. She holds a master's degree in library and information science from Drexel University and a master of arts in American and British literature from Indiana State University. Her research interests are slave narratives, African American poetry, and literature.

Audrey Robinson-Nkongola is an assistant professor and campus librarian at Western Kentucky, Glasgow. She earned a master of arts from Indiana State University in Terre Haute, Indiana, and a master of library information science from Drexel University in Philadelphia, Pennsylvania.

Karissa Sabine is a master's student and graduate teaching assistant in women, gender, and sexuality studies at Oregon State University. Her research revolves around the ways girlhood is represented in the films of Hayao Miyazaki.

Brian Santana is currently a professor in the Department of Writing and Linguistics at Georgia Southern University. He holds a PhD in American studies from George Washington University and a master of arts in English from North Carolina State University. His research interests include 19th-century American literature, film studies, and cultural theory.

LinDa Saphan earned a PhD in sociology in Paris in 2007. Saphan is an associate producer and head researcher for the documentary film *Don't Think I've Forgotten: Cambodia Lost Rock and Roll*, directed by John Pirozzi, which was released in 2014. She is currently an assistant professor of sociology at the College of Mount Saint Vincent.

Awo Abena Amoa Sarpong, PhD, is a lecturer of art education at the University of Cape Coast, in Ghana. She teaches courses that draw on her research on culturally responsive education. She coauthored a chapter, "Fancy Dress Masquerade in Cape Coast as a Haven for Negotiating Eccentricity during Childhood," in *Misfit Children: An Enquiry into Childhood Belongings*. She is also curator of the Gramophone Records Museum and Research Centre in Ghana.

R. Kyle Saunders is a first-year doctoral student of sociology at West Virginia University. His current research is in social psychology and involves bias, blame, and helping behaviors. His dissertation strives for an expansion of the concept of morality and status characteristics theory, specifically exploring sexual orientation as a status characteristic.

Dawn Schiller is a survivor and leader in the antitrafficking, domestic violence, and sexual assault movements. She is a national speaker, consultant, and author. She graduated summa cum laude in 2012 with a BS in liberal studies, and in 2017 she earned an MA in women, gender, and sexuality. She teaches courses on activism and difference, power, and discrimination and is a contributing writer for Crixeo.com. She is a member of Phi Kappa Phi honors society and sits on multiple organizations dedicated to ending violence against vulnerable populations, particularly women and girls.

Debra L. Schultz, PhD, is an assistant professor of history at Kingsborough Community College in Brooklyn, New York. She is the author of *Going South: Jewish Women in the Civil Rights Movement*.

Tamanna M. Shah is a sociologist. She received a master's degree in sociology from Kansas State University and an MBA from DAV University. She is currently a research analyst and leads the company's research group at IL&FS Clusters, where she is actively involved in publishing impact assessments of projects across the verticals of education, clusters, and skills. She also facilitates the strategic use of knowledge management resources and research capabilities.

Maysa Shakibnia-Shirazi is studying public health at Oregon State University. She is an Iranian American born and raised in Oregon, and she enjoys spending her summers in Iran, where she studies Farsi, travels, enjoys time with her family, and eats Persian cuisine cooked by her grandmother.

Karen J. Shaw is the vice president and chief development officer for Samaritan Foundations in Corvallis, Oregon, supporting the Samaritan Health Services system. She holds a BS from Berry College in Rome, Georgia, and has spent her career in nonprofit and higher education development.

Mary-Antoinette Smith is an associate professor at Seattle University who received a PhD in 18th-century British literature from the University of Southern California. In addition to having served as director of women and gender studies, she is passionate in how her pedagogical and scholarly work promotes race, class, and gender theory as the primary lens for interpreting literary and cultural works and in her commitment to mission work she has done in Uganda and Kenya.

Tiffani J. Smith is a PhD student in the School of Educational Studies and holds a certificate in women and gender studies. She holds a BA in communication studies and political science with honors as well as an MA in communication studies. Her research focuses on the resistance, navigational, and resilience capital of women of African descent, particularly but not limited to education, politics, and media representations.

Vanja Spirić completed the individualized interdisciplinary MA program with a focus in sociology at the University of Lethbridge in Alberta, Canada. Her interests include philosophy of social sciences, qualitative research methodology, and disability studies.

Nykia Steger is a Two-Spirit student, artist, writer, and poet who graduated with a BS in anthropology from Oregon State University and resides in Corvallis, Oregon. He is presently completing an MA in women, gender, and sexuality studies at Oregon State University with a graduate teaching assistantship appointment. Steger's poetry and art depicting the queer, indigenous experience was highlighted in the recently published collection *Locusts: A Post-Queer Nation Zine*.

Alissa Stoehr is a lecturer in the Sociology Department and the women's and gender studies program at Iowa State University in Ames, Iowa. Her research interests include human trafficking, women's and gender studies programs at community colleges, and work-life balance issues of female PhD students.

Sudy Storm, MPH, has worked in West Africa since 1999 as a midwife and clinical medical anthropologist to provide training and capacity-building programs for traditional midwives

and community health workers in remote village regions. She continues to work and conduct research into the medical ecology of maternal-child health in Sierra Leone, where she lives for several weeks each year.

Beth Strickland is a PhD candidate in library and information science at the University of Illinois, Urbana-Champaign. She has a background in women and gender studies and is currently researching the privacy and security implications of using IoT-enabled medical devices.

Amy Stringer received her PhD in political science from the University of Florida with a focus on American government and public policy. Her research interests include Latino politics, education policy, immigration policy, women and government, Congress, environmental policy, and the bureaucracy. She currently works as a research analyst for a nonprofit and conducts research on school choice.

Sarah Taylor is a PhD student at the University of Nebraska-Lincoln. Her research focuses on violence against women and cultural competence.

Yihenew Tesfaye is a biocultural medical anthropologist who received a master's degree in biomedical sciences from Addis Ababa University, Ethiopia. He is a doctoral candidate in applied medical anthropology at Oregon State University. He has been involved in several studies in East Africa focusing on health (malaria), water insecurity, water governance, and women's psychosocial well-being. His dissertation will focus on developing and validating a water insecurity measurement scale in rural Ethiopia.

Jennifer Thorpe is a feminist writer and researcher based in Cape Town. She has a master's degree in political studies from Rhodes University and a master's in creative writing from the University of Cape Town. She will spend 2017 writing fiction and researching LGBTI access to political spaces.

Francesca Tronetti, ABD, is a doctoral student in women's spirituality at the California Institute of Integral Studies, San Francisco. She received a joint master's in anthropology and women and gender studies at Brandeis University. Her work is focused on the anthropology of religion, women's experiences of the divine, and pagan studies. She teaches ESL to immigrant and refugee students at the Multicultural Community Resource Center in Erie, Pennsylvania.

Chloe Tull has an MA in U.S. political history from the Ohio State University and a BA in U.S. history from Oregon State University. Her scholarship focused on the intersections between women, labor, and welfare during World War II. She currently works in the field of health care as a recruiter and is passionate that equal access to health care must be a right for all.

Maura Valentino began her career as a Microsoft-certified trainer, teaching programming and database administration. She then returned to school and received an MSLIS from Syracuse University. Beginning in 2009, she served as the coordinator of digital initiatives at the University of Oklahoma and currently is the metadata librarian at Oregon State University. Her research interests focus on the digital libraries, metadata, and data management.

Vanessa Vanderzee earned her bachelor's degree at Dominican University in River Forest, Illinois, and is pursuing a master's degree in women, gender, and sexuality studies at Oregon State University. Her thesis research centers on asexuality and uses social media analysis to explore asexual-identifying individuals' experiences in accessing health care services.

Urvashi Vashist teaches at the University of Delhi and researches 20th-century fictions, women's writing, and geomodernism. She has written and published articles on the postcolonial fantastic, Virginia Woolf, Cornelia Sorabji, Arundhati Roy, Adivasi writing, Doris Lessing, Diana Wynne Jones, fan fiction, European modernism, and contemporary theatre in London. Her interests include otherness, precarity, feminist dissent, queer reorientations of postcolonial (hi)stories, (anti)canonicity, participatory culture, pedagogy as resistance, and the fantastic as radical realism. She collects protest poetry by women and is currently working on storytelling in alien tongues by Silvina Ocampo, Ling Shuhua, Octavia Butler, and Mahasweta Devi.

Virginia Villamediana has a master's degree in social sciences with a focus in gender and development from FLACSO, Ecuador (Facultad Latinoamericana de Ciencias Sociales). She is currently a doctoral student in Andean Studies of the Sociology and Gender Department at FLACSO, Ecuador. Her current research focuses on politics and citizenship.

Craig Warlick is a student in counseling psychology at the University of Kansas. Craig's research lies in the intersections of religious fundamentalism, vocation, positive psychology, and evidence-based treatments in psychotherapy for underserved populations, including women. He is an alumnus of the University of Kansas and the University of West Alabama.

Richard Weiner has a PhD in history from the University of California, Irvine (1999), and is a professor and the department chair of history at Indiana University–Purdue University Fort Wayne, as well as the associate editor of reviews for *Enterprise and Society*. His most recent book (coauthored with Francisco Altable, Edward Beatty, and José Enrique Covarrubias) is *El mito de una riqueza proverbial: Ideas, utopías y proyectos económicos en torno a México en los siglos XVIII y XIX*.

Rachel Wexelbaum is an associate professor and librarian at St. Cloud State University in St. Cloud, Minnesota. She writes encyclopedia entries dealing with women's studies, LGBT studies, Jewish studies, and other topics for traditional reference resources and Wikipedia. Currently, she is working on an LGBT studies research guide for Rowman & Littlefield.

Lacey Willmott, MSc, is a PhD candidate in geography at the University of Waterloo. Her research examines gender, disasters, global health, and management through a lens of intersectional equality, with a regional focus on Southern Africa. She has worked, researched, consulted, and taught across Southeast Asia in the areas of small island sustainable development, community-based development, women's livelihoods, and environmental management.

Nicole Wiseman is a cultural anthropologist who received her master's degree in applied anthropology from Oregon State University in 2015 after completing her thesis research on the consequences of structural violence for women of North African origin in Marseille, France. She served as an anthropological consultant for the nonprofit organization *Approches Cultures & Territoires* for its exhibit on shantytowns in Marseille, hosted in the Musée d'Histoire

de Marseille. She continues her work fighting for social justice through the labor movement in the United States.

Miriam Wojtas is an undergraduate student in women, gender, and sexuality studies; Spanish; and peace studies at Oregon State University. She is working on an honors thesis that focuses on migrant narratives, illegality, and processes of racialization in the United States.

Melissa Crocker Wolfe has a master of interdisciplinary studies and a graduate certificate in university teaching from Oregon State University. She has presented her work on queer Chicanas and Latinas at conferences in the United States and Puerto Rico. Her areas of focus include gender and sexuality and contemporary Latin@ studies.

Susan Wood is a librarian at Suffolk County Community College. She holds an MA in women's studies and rhetoric and composition and an MS in information sciences. Her research interests include information literacy and feminist theory.

Karinda Woodward possesses a master's degree in women, gender, and sexuality studies. Her research interests include reproductive and epistemic justice with a focus on respectable parenthood, poverty, class, and "worthy" knowledge. Theoretical approaches applied in Woodward's research include affect theory, social abjection, queer theory, and biopolitics. Woodward has taught courses on introductory feminisms and LGBTQ perspectives. She employs her academic interests through supporting underserved individuals and families within a nonprofit organization.

Shanshan Yang received her PhD in Asian and comparative studies from California Institute of Integral Studies. Her research focuses on gender, philosophy, and education. She is the founder of Orchid Multi-culture, the director of Early Bird International Cultural Exchange, and an officer of the American Academy of Religion Western Region.

Susy Zepeda is an assistant professor in Chicana/o Studies at UC Davis. She is a decolonial feminist scholar and received her PhD in sociology (feminist studies and Latin American and Latino studies) from UC Santa Cruz in 2012. Zepeda is part of the Santa Cruz Feminist of Color Collective.
